Mac OS X: About the Mac OS X 10.2.6 Update (Combo)

This software updates Mac OS X 10.2, 10.2.1, 10.2.2, 10.2.3, 10.2.4, or 10.2.5 to version 10.2.6.
This article has been archived and is no longer updated by Apple.
Important: Read Before Installing

1. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

2. To install Mac OS X 10.2.6, you must enter the password for an administrator account. The password cannot contain a space or special characters typed by pressing the Option key.

If you need to change an administrator account password, choose Apple menu > System Preferences, then choose View > Accounts. Select the account name and click Edit User. Type the current password and press Return, then type the new password in both text boxes. Click OK when you are done.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Featured Software to install.

Installation

There are two ways to update to Mac OS X 10.2.6.

Automatic Software Update Installation

You may have been referred to this document by Automatic Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installers

An installer is available from Apple Featured Software (http://www.apple.com/swupdates/). Mac OS X 10.2.6 Update (Combo) updates Mac OS X 10.2 through 10.2.5 to version 10.2.6.

Enhancements

Several enhancements are delivered with this update. Because this is a combo update, it also includes those delivered with Mac OS X 10.2.1, 10.2.2, 10.2.3, 10.2.4, and 10.2.5. Enhancements are listed individually in these technical documents:

25448: "**Mac OS X: About the Mac OS X 10.2.6 Update**"
25405: "**Mac OS X: About the Mac OS X 10.2.5 Update**"
107362: "**Mac OS X: About the Mac OS X 10.2.4 Update**"
107263: "**Mac OS X: About the Mac OS X 10.2.3 Update**"
107140: "**Mac OS X: About the Mac OS X 10.2.2 Update**"
107036: "**Mac OS X: About the Mac OS X 10.2.1 Update**"

No low-battery alert before sleep in portables and Mac OS X 10.2

PowerBook and iBook computers running a version of Mac OS X 10.2 may not display an alert message that the battery is low before going to sleep.

This article has been archived and is no longer updated by Apple.

This will only occur in Mac OS X 10.2 through 10.2.8. If you are running a version of Mac OS X 10.2 on a PowerBook or iBook, be sure you connect the computer to its power adapter once it goes to sleep.

Important: Sleep, or low-power mode, preserves the state of the computer for a period of time, but if AC power is not connected and the battery is completely emptied, unsaved documents and data that is in memory will be lost.

Published Date: Feb 20, 2012

Mac OS X 10.2: Archive and Install Does Not Preserve Some Settings

The Archive and Install feature preserves most, but not all, systems settings.

Note: This document applies to Mac OS X 10.2 through 10.2.8.
This article has been archived and is no longer updated by Apple.
The Archive and Install feature preserves most, but not all, systems settings. The following settings are not preserved when you choose Archive and Install, even if you select "Preserve user and network settings."

- Whether a network time server is used or not.
- The list of configured printers (stored in the file /etc/printers.conf).
- The computer's time zone (stored in the file /etc/localtime).
- The resolution of your display(s), and other settings if more than one display is connected, such as arrangement (stored in the com.apple.windowserver.plist in /Library/Preferences, ~/Library/Preferences/ByHost/).
- Sharing preferences pane settings (stored in /etc/hostconfig):
  - Personal File Sharing
  - Personal Web Sharing
  - Windows File Sharing
  - Remote Login
  - Remote Apple Events
  - Printer Sharing
  - Computer name

This is expected behavior.

Mac OS X: Some Keys Don‘t Work as Expected After Switching Input Methods

Some keys may not work as expected when you switch between input methods.

This article has been archived and is no longer updated by Apple.

Symptom

Some keys do not work as expected after switching input methods

For example, if you switch to Kotoeri by selecting the Canadian - CSA input method, you aren't able to form some double-byte Koteri characters:

／ (unicode: FF0F)
？ (FF1F)
" (201D)
' (2019)
＜ (FF1C)
＞ (FF1E)

Solution

Choose U.S. from the input menu (looks like a flag) before choosing a different input method.

For example, to change from Canadian - CSA to Kotoeri, choose U.S. from the input menu first, then choose Kotoeri.

This document will be updated as more information becomes available.

Mac OS X 10.2: Document Printed to Shared Printer Can‘t Be Deleted in Print Center

You may not be able to delete a document from Print Center that you tried to print to a shared printer.
This article has been archived and is no longer updated by Apple.

Symptom

A shared printer appears in your printer list even though you have turned off the option to "Show printers connected to other computers".

A shared printer contains a print job, but you cannot delete the print job in Print Center.

Solution

Use the CUPS Web Admin utility.

1. Open a Web browser and go to the address: http://127.0.0.1:631
2. Click the "Manage Jobs" link.
3. Select print job then click the "Cancel Job" button.

Note: Only use the CUPS Web Admin Utility when you cannot resolve an issue in Print Center.

Mac OS X 10.2: Cannot Install 10.2.5 Update After Installing AirPort 3.0.4

After installing the AirPort 3.0.4 update, Mac OS X 10.2.5 cannot be installed.
This article has been archived and is no longer updated by Apple.

Symptom

After installing the AirPort 3.0.4 update, you cannot install Mac OS X 10.2.5.

Solution

Use the Mac OS X 10.2.6 Update (Combo) installer instead. See technical document 75421, "**Mac OS X 10.2: Chart of Available Mac OS Software Updates**".

Related documents

Mac OS X 10.2: How to Delete a Previous Systems Folder

This document explains how to delete the Previous Systems folder, which is created during an Archive and Install installation. This document assumes that you have already completed an Archive and Install installation.
This article has been archived and is no longer updated by Apple.
Important: Before using this document, make sure you have copied everything you want to keep from the Previous Systems folder, including Shared folder contents. See technical document 107447, "**Mac OS X 10.2: Contents of Shared Folder Missing After Archive and Install**" for more information.

Important: Read the related documents below for more information about Archive and Install, as well as data or settings that may be missing after the installation.

1. Log in with an administrator account.
2. Click the Finder icon in the Dock.
3. Open the Mac OS X volume. (This is usually called Macintosh HD, but could be named something else if you renamed it.)
4. Select the Previous Systems folder.
5. Choose File > Get Info.
6. Click the disclosure triangle next to Ownership & Permissions to expand this section.
7. Click the lock icon to see the owner and group options. Enter your password if prompted.
8. Choose the account name from the "system" pop-up menu.
9. Enter your account password if prompted.
10. Close the Get Info window.
11. Drag the folder named "Previous Systems" to the Trash.
12. Choose File > Empty Trash when you are ready to delete the folder.

Mac OS X 10.2: Audio Balance Unexpectedly Drifts

In some cases the audio balance may unexpectedly drift towards the left or right channel. This can happen if you rapidly press the volume up or down keys while the computer's microprocessor is under heavy load.
This article has been archived and is no longer updated by Apple.

Symptom

The audio balance unexpectedly drifts to the left or right.

Solution

Use the Sound preference pane to restore audio balance.

1. Choose Apple Menu > System Preferences.
2. Choose View > Sound.
3. Drag the audio balance slider to the desired position.

Mac OS X 10.2, 10.3 or later: How to manage PostScript printers for Classic

Use Print Center (Mac OS X 10.2) or Printer Setup Utility (Mac OS X 10.3 or later) utility to add and set a default PostScript printer for the Classic environment.
This article has been archived and is no longer updated by Apple.
The utility is located in /Applications/Utilities. You can use it to add PostScript (LaserWriter 8-compatible) printers for the Classic environment.

Tip: Printers added via the Classic Chooser or Desktop Printer Utility are not available to Mac OS X native applications until they are selected in Print Center or Printer Setup Utility.

Published Date: Feb 17, 2012

Mac OS 8, 9: Virtual Memory Maximum Setting

This document outlines the maximum virtual memory setting for Mac OS 8 and 9.
This article has been archived and is no longer updated by Apple.
The maximum virtual memory size setting is about 999 MB assuming that this much hard disk space is available. The exact maximum setting depends on the version of Mac OS 8 or 9 you are using. If more than 1 GB of memory is installed, the Memory control panel states:

"This computer has more than 996 MB of RAM installed. Virtual Memory can only be turned on when less than this amount of RAM is installed."

Note: The exact limit shown depends on the version of Mac OS 8 or 9 you are using.

Some of the memory is reserved for file mapping code fragments, and some is reserved for other system use.

Note: The maximum amount of virtual memory available on your computer is limited by available space on your hard disk. You cannot make a virtual memory setting that is larger than the amount of free hard disk space.

Published Date: Feb 17, 2012

Mac OS X 10.1, 10.2: Mail - Address Book (vCard) Images Do not Appear

Images in the picture field of an Address Book vCard do not appear in Mail messages.
This article has been archived and is no longer updated by Apple.

Symptom

Images pasted into Address Book vCards do not appear in Mail messages.

Solution

This is expected behavior. However, if you have a .Mac account, the Mail application can automatically show pictures in messages you receive from other .Mac members. Your picture also appears in messages you send to other .Mac members. **Note**: The picture is retrieved from a .Mac server by Mail, it is not a message attachment.

For more information, see technical document 86095, "**.Mac: How to Add Photos to Messages Sent With WebMail**".

Mac OS X: Can‘t burn MS-DOS-formatted disk image

Disk Copy (Mac OS X 10.2.8 or earlier) or Disk Utility (Mac OS X 10.3 or later) does not burn disk images that contain MS-DOS formatted volumes (such as FAT-12, FAT-16, and FAT-32 formats).
This article has been archived and is no longer updated by Apple.

Symptom

You can't burn the image. This message appears:

"Burn. The data on this image will not mount properly when burned to a disc."

Solution

Consider using a different volume format as the source of your image such as:

- HFS Plus (Mac OS Extended) / ISO 9660 hybrid
- HFS Plus (Mac OS Extended)
- ISO 9660
- UFS
- HFS

Some third-party disc-burning applications may offer these features, such as:

- Roxio Toast (http://www.roxio.com/)
- NTI Dragon Burn (http://www.ntius.com/)

Refer to documentation that came with the third-party product for further instructions.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X: Apple System Profiler Displays Filled Memory (RAM) Slots as Empty

Damaged or incompatible memory (RAM) may not appear in Apple System Profiler (ASP).
This article has been archived and is no longer updated by Apple.

Symptom

Apple System Profiler may show some memory slots as empty even though the slot contains memory.

Solution

Whenever possible, visually inspect the memory slots on the computer to determine which slots are actually filled. Make sure that the RAM is firmly inserted in the slot.

If ASP detects and displays the memory when it is installed in a different computer, the original computer may require a different kind of memory. To find out what kind of memory your computer uses, search the Knowledge Base.

If the memory does not work in any computer, it may not meet specifications or could be defective. Contact your memory vendor or supplier for additional information.

Published Date: Feb 17, 2012

Mac OS X: Issues After System Fonts Removed or Relocated

Applications, including Apple System Profiler, TextEdit, Address Book, and Safari, may unexpectedly quit if System fonts are deleted or moved from /System/Library/Fonts.
This article has been archived and is no longer updated by Apple.
To fix this, reinstall the system fonts, or move them back into their folder (/System/Library/Fonts). This includes the Helvetica font.

Some third-party applications may allow you to move system fonts. Usually, you should not move or delete Apple-installed fonts.

Note: This document does not apply to the Helvetica font found in the Mac OS 9 System Folder used by Classic.

Mac OS X 10.2: Chinese, Kotoeri, or Korean Conversion Fails If an Account‘s Application Access Is Restricted

If you restrict the applications available to non-administrator accounts, those users will not be able to perform Kanji conversions in Kotoeri, type Chinese in the Simplified or Traditional Chinese input methods, or convert Hangul to Hanja in the Korean power input method.
This article has been archived and is no longer updated by Apple.

Symptom

For Kotoeri

- The Kotoeri Character Pallet window does not appear.
- Hiragana input works but will not convert to Kanji.

For Chinese

- Cannot type Chinese in the Simplified or Traditional input methods.
- Items in the Chinese Pencil menus can be selected, but have no effect. The Operation Palette, Character Table, and other windows do not appear when the corresponding menu item is selected.
- User dictionary editing does not work.
- Chinese text typed in pinyin or bopomofo cannot be converted to Chinese characters. Tsang Jie and other non-phonetic input modes do not work.

For Korean (power input method)

- Cannot convert Hangul to Hanja.
- Items in the Korean Pencil menus can be selected, but have no effect. The Input Palette, Plugin Manager, and other windows do not appear.
- Hangul input cannot be converted to Chinese characters. Trying this conversion may cause the application to unexpectedly quit.

Solution

Do not restrict the affected account(s) from accessing applications, or follow these steps to allow access to the proper applications:

1. Log in using an administrator account.
2. Choose Apple menu > System Preferences.
3. Choose View > Accounts.
4. Select the affected user and click the Capabilities button.
5. Select "Use only these applications," then click the Locate button.
6. Add these files depending on which language or conversion is affected:
   - For Kotoeri and Kanji

     ```
     /System/Library/Components/Kotoeri.component/Contents/Support/KotoeriUIServer.app
     /System/Library/Frameworks/ApplicationServices.framework/Versions/A/Frameworks/LangAnalysis.framework/Versions/A/Support/LAServer
     ```
   - For Simplified Chinese

     ```
     /System/Library/Components/SCIMUIServer.app
     /System/Library/Components/SCIMTool.app
     ```
   - For Traditional Chinese and Mac OS X 10.2.3 and earlier:

     ```
     /System/Library/Components/TCIMUIServer.app
     /System/Library/Components/TCIMTool.app
     ```
   - For Traditional Chinese and Mac OS X 10.2.4 or later:

     ```
     /System/Library/Components/TCIM.component/Contents/Support/TCIMUIServer.app
     /System/Library/Components/TCIM.component/Contents/Support/TCIMTool.app
     ```
   - For Korean (Power Input Method)

     ```
     /System/Library/Components/PIMUIServer.app
     ```

This document will be updated as more information becomes available.

Published Date: Oct 10, 2016

Mac OS X 10.1: Cannot Install 10.1 Over 10.2 or While Started Up From 10.2

The Mac OS X 10.1 installer will not open on a computer that is started up from Mac OS X 10.2, or install on a volume that already has Mac OS X 10.2 installed on it

This article has been archived and is no longer updated by Apple.

Symptom

- The Mac OS X 10.1 installer does not open if the computer is started up with Mac OS X 10.2.
- A Mac OS X 10.2 volume or partition is dimmed in the Mac OS X 10.1 installer.

Solution

To install Mac OS X 10.1 on a Mac OS X 10.2 volume or partition, start up from the Mac OS X 10.1 installation disc and erase the target volume.

Warning: Choosing Erase and Install completely erases the contents of the selected volume. Be sure to back up your files before continuing. To learn more, see technical document 106941, "**Mac OS X: How to Back Up and Restore Your Files**".

Published Date: Feb 17, 2012

Mac OS X 10.2: Keychain Unexpectedly Stores Mail Password

The Keychain application may store your Mail account password even if you tell it not to.
This article has been archived and is no longer updated by Apple.

Symptom

- Keychain unexpectedly stores your Mail password.
- You expect to be prompted for your Mail account password, but aren't.

Solution

You can remove the password using the Keychain Access utility. However, storing the password in the Keychain does not expose it to anyone else. It is not a security issue.

If you edit account information in Mail, the password may be unexpectedly added to the Keychain again.
Published Date: Feb 17, 2012

Mac OS X 10.2: "Unable to connect to IP Host" Alert When Printing to Shared Printer

Printing to a shared printer does not work in certain network configurations if the BSD subsystem is not installed.
This article has been archived and is no longer updated by Apple.

Symptom

This alert appears: "Unable to connect to IPP Host: Undefined error 0" in certain network configurations", and your document does not print.

This happens when:

- the BSD subsystem is not installed.
- the computer sharing the printer has an IP address that is not associated with any name on the DNS server

Solution

Install the BSD Subsystem software. Refer to technical document 25534, "**Mac OS X 10.2: How to Install the BSD Subsystem After Mac OS X 10.2**" for more information. Restart after installation is complete.

Additional information

This symptom is likely to occur when the IP address for the computer sharing the printer is provided by an AirPort Base Station or third-party broadband router --the IP address has no associated name on the DNS server.

Mac OS X 10.2 or later: About Apple Software Restore (asr) Command Line Utility

This advanced document discusses the Apple Software Restore command line utility. A command line utility is a text-only program that runs in Terminal.
This article has been archived and is no longer updated by Apple.
With the Apple Software Restore command line utility (asr), you can use to restore software from custom images, or to "clone" entire volumes. The asr utility works with Mac OS Extended (HFS Plus) volumes only.

This utility is intended for use by manufacturing and professional customers. AppleCare does not provide technical support for asr, but technical support solutions may be available. For more information see the AppleCare Products & Services website (http://www.apple.com/support/products/).

For more information, open Terminal and type: `man asr`

Note: Apple Software Restore is also an application that is used to restore software from discs included with a computer. The "traditional" restore application does not use Terminal or the command line.

A note about copyright

This utility may be used to reproduce materials. It is licensed to you only for reproduction of non-copyrighted materials, materials in which you own the copyright, or materials you are authorized or legally permitted to reproduce. If you are uncertain about your right to copy any material, you should contact your legal advisor.

Mac OS X: About Using Several Displays at High Resolutions

Mac OS X allows a maximum desktop display width of approximately 4000 pixels across all displays. This document applies to Mac OS X 10.3.4 and earlier.

Note: This document is relevant when using the extended desktop feature with multiple displays connected to the computer. It does not apply when you are using the Mirror Displays feature, as configured in the Arrangement section of the Display preference pane.
This article has been archived and is no longer updated by Apple.
Mac OS X 10.3.4 or earlier allows for a maximum desktop display width of approximately 4000 pixels across all active displays. You would not usually encounter this limit unless you had three or more displays with one using a resolution width greater than 1280.

You may set a cumulative width greater than that, but you cannot place icons on the desktop outside of this 4000-pixel width. Icons dragged to this area will snap back to their original location.

Desktop pictures can fill the entire visible width.

Additional information

These sample configurations are within the approximately 4000-pixel limit. Not all Mac OS X-compatible computers allow for the use of each configuration.

- Two displays, each set to a width of 1920 pixels.
- Three displays, each set to a width of 1280 pixels.
- Three displays, two set to a width of 1152 pixels and the third set to a width of 1600 pixels.
- Four displays, two set to a width of 1152 pixels and two set to a width of 832 pixels.

Published Date: Feb 17, 2012

Mac OS X: Mail - Unable to Quit After Stopping a Message From Being Sent

You may not be able to quit Mail if you cancel sending a message.
This article has been archived and is no longer updated by Apple.

Symptom

When you choose Mail > Quit Mail, or press Command-Q, Mail does not quit. This happens when:

- Your Internet connection is not fast.
- You cancel sending a message before it is sent.

Solution

Before quitting Mail, wait for the program to cancel sending the message. This may take several seconds depending on the size of the email.
Published Date: Feb 17, 2012

Mac OS X 10.2: Mail - Quits When Sending if Some Third-Party Mail Bundles Are Installed

Mail may unexpectedly quit when sending a message if incompatible third-party mail bundles are installed.
This article has been archived and is no longer updated by Apple.

Symptom

Mail unexpectedly quits when sending a message.

This happens when one or more third-party mail bundles are installed.

Solution

Remove any third-party mail bundles installed when the issue began, or remove all bundles. These bundles are usually found in this folder:

~/Library/Mail/Bundles

Contact the publisher of any bundles that do not seem to work with Mail for more information--a later, more compatible version may be available.

Additional information

Examples of third-party mail bundles include those that provide encryption (PGP), message icons, or headers that may be prioritized.
Published Date: Feb 19, 2012

Mac OS X 10.2: Directory Issue Verification or Repair Is Not Part of Installation

When installing Mac OS X 10.2, disk directory issues are not checked for or repaired. Use Disk Utility's First Aid feature first if you think there may be a directory issue. Catalog file issues, B-Tree errors, mount check errors, and overlapped extent allocation errors are examples of directory issues.

Important: Performing an upgrade or Archive and Install installation when there are unresolved directory issues can make the issue worse, and possibly lead to data loss.
This article has been archived and is no longer updated by Apple.
Reinstalling or updating Mac OS X 10.2 does not resolve disk directory issues (unless you perform an erase-installation). Use Disk Utility's First Aid feature to verify or repair the Mac OS X volume first, unless you intend to erase the volume. For more information about Disk Utility, see technical document 106214, "**Mac OS X: About Using Disk Utility and fsck for File System Maintenance**".
Published Date: Oct 10, 2016

Mac OS X: Does Not Start Up From Hard Drive Used in a Different Computer, or from a Custom Restored Image

Later model Macintosh computers that cannot start up from Mac OS 9 may not be able to start up from a hard drive that was used in an earlier model computer, or if you restore the system using the asr Terminal command from an image that was created on an earlier Macintosh computer. This article has been archived and is no longer updated by Apple.

Symptom

- A late-model computer does not start up from a asr-restored hard drive or a burned disc that works with earlier computers.
- The computer starts up from its original hard drive instead of a second hard drive you installed from another computer that has Mac OS X installed on it.

This can occur when the original hard drive, or restored image of that drive, was first used in a computer that can start up in Mac OS 9, or is an Xserve, but the receiving computer cannot start up in Mac OS 9.

Solution

If the hard drive has already been moved or restored

You can use this solution if a different Mac OS X volume is in the computer (excluding the Install or Restore CD that came with the computer). If you do not have a different volume, you must move the drive back to the earlier computer and follow the instructions below under "Before moving the hard drive or creating the restorable image with asr".

After the computer starts from Mac OS X on a different disk volume, Open Terminal (/Applications/Utilities) and type this command:

```
#sudo bless -folder /Volumes/Your_Volume_Name/System/Library/CoreServices -bootinfo
/usr/standalone/ppc/bootx.bootinfo
```

Notes

1. Replace "Your_Volume_Name" with the name of the volume that the Mac OS X System folder is on.
2. A space precedes and follows "-bootinfo". All commands should be on a single line.

Before moving the hard drive or creating the restorable image with asr

Use this solution before moving the hard drive. Start up from the system that is to be used in the new computer or for the image. Open Terminal (/Applications/Utilities) and type this command:

```
#sudo bless -folder /System/Library/CoreServices -bootinfo /usr/standalone/ppc/bootx.bootinfo
```

Note: A space precedes and follows "-bootinfo". All commands should be on a single line.

Power Mac G4: Mac OS 9 - "About This Computer" Window Displays Unexpectedly Large Mac OS RAM Usage

On some Power Mac G4 computers, the Mac OS 9 "About This Computer" window indicates that the Mac OS is using a large amount of memory (RAM).
This article has been archived and is no longer updated by Apple.

Symptom

The Mac OS 9 "About This Computer" window indicates the Mac OS is using an unexpectedly large amount of RAM (up to 600 MB). This happens when:

- The computer is started from a Mac OS 9 System Folder
- More than 1.5 GB of RAM is installed

Note: The virtual memory setting does not matter because you cannot turn it on when more than 1 GB of RAM is installed.

Solution

The Mac OS is not actually using this much RAM. This is a cosmetic issue and not a cause for concern.

Note: This does not occur when using Mac OS X or the Classic environment.

Published Date: Oct 10, 2016

Mac OS X 10.2: USB-Based PostScript Printer Does Not Print or Generate PostScript Error

Some USB-based PostScript printers may not print or display PostScript errors.
This article has been archived and is no longer updated by Apple.

Symptom

The printer does not print, and there is no alert message.

This can happen when:

- You are using a USB-based PostScript printer.
- The printer does not support TBCP (tagged binary control protocol).

Note: If PostScript reporting is selected, you may see a "PostScript Error undefined" message.

Solution

Mac OS X 10.2 may not work with USB-based PostScript printers that do not have a TBCP feature.

As a workaround, connect your printer via Ethernet (if the printer has an Ethernet port), then use Print Center to set up your printer.

If you are printing from a Classic application that allows you to Send PostScript Data as ASCII when printing, use that as a workaround.

Contact your printer manufacturer for printer-specific solutions or for more information.

Mac OS X: How to Create a ColorSync Profile Used By Every Account

An administrator account can create a ColorSync profile and make it available to all accounts on the computer.
This article has been archived and is no longer updated by Apple.
When a display is calibrated by a user, a ColorSync profile is saved in that user's home folder. Instead of calibrating the display for each account, you can copy the profile to other accounts' home directories by following these steps:

1. Log in with an administrator account.
2. Choose Apple Menu > System Preferences.
3. Choose View > Displays.
4. Calibrate the display.
5. Once calibrated, the ColorSync profile is saved in this folder: ~/Library/ColorSync/Profiles/

   Note: The default name is "Calibrated Profile.icc".

6. Drag the profile to: /Library/ColorSync/Profiles/. **Note:** You may need to make some of these folders if they do not exist.
7. Log in using a different account.
8. Choose Apple Menu > System Preferences.
9. Choose View > Displays.
10. Click the Color tab, then select the correct profile.
11. Repeat steps 7 through 10 for each additional account.

Published Date: Feb 17, 2012

Mac OS X Mail: Printed text is unexpectedly large or small

Text in email messages you print, with Mac OS X 10.2.8 or earlier, has an unexpectedly large or small font size. The same thing happens if you create a PDF file of an email message.
This article has been archived and is no longer updated by Apple.
This happens because Mail in Mac OS X 10.2.8 or earlier automatically scales printed text based on the width of your Mail message window. The wider the window, the smaller the printed text.

What can you do? Before printing or saving as a PDF, change the size of the window by positioning the pointer over the lower-right window corner (the resize control) and dragging.

- If the printed text is too small, make the Mail message window more *narrow*.
- If the printed text is too big, make the Mail message window *wider*.

Or you could do this:

1. Copy the text of the message.
2. Open a different text application, such as TextEdit.
3. Paste your email address into the new document.
4. From the **File** menu, choose **Print**.

Tip: You can preview the printout by clicking the Preview button in the print dialogue.

Mac OS X: Portables - Using Function keys with Exposé, applications, games

The function keys of some portable computers, such as F1, F2, F3, F4, F5, F6, and F12, also serve as volume and brightness control buttons, which may present issues when you want to use the same key with an application, game, or Mac OS X 10.3 Panther and Mac OS X 10.4 Tiger's Exposé feature.
This article has been archived and is no longer updated by Apple.
To use a function key as a function key instead of a volume or brightness control, hold the Function (fn) key while pressing the key (for example, Function-F1).

Tip: Mac OS X 10.3.3 or later includes a setting in Keyboard & Mouse preferences to change this behavior if desired, for portable computers. To use a function key for custom actions without having to hold the Function (fn) key, open Keyboard & Mouse preferences and enable "Use the F1-F12 keys for custom actions". If this option is enabled, you must hold the Fn key and a function key to perform actions such as changing the screen brightness (Fn-F1 or Fn-F2 instead of F1 or F2) or ejecting the optical drive tray (Fn-F12 instead of just F12).

Alternatively, if your application allows, you may be able to "reassign" the software function to be associated with a different key. For Mac OS X 10.3, the Exposé preference allows you to assign Exposé functions to different function keys or some other keys (such as Right Control or Shift-F12), or to a mouse button if you have a third-party mouse which has multiple buttons.

Mac OS X 10.2: Automatic Modem Connection Fails

In some cases, Mac OS X 10.2 may not establish an automatic (dial-on-demand) modem connection when expected. Manually connect to the Internet if this happens.
This article has been archived and is no longer updated by Apple.

Symptom

- A Mac OS X feature that depends on Internet access (such as using Mail, retrieving new Mac Help content, or loading a webpage with Safari) does not work. This can happen when you use a modem and have selected automatic connections in the Network preference pane's PPP tab.
- Internet Connect displays these messages:

  "The connection was terminated by the remote site. Please try again."

  "The connection was terminated because the other side is not responding."

- The Console verbose log may include a message such as "Unsupported protocol 'IP' (0x21) received and IPCP terminated by peer".

Solution

First, deselect automatic connections. You only need to do this one time.

1. Choose Apple Menu > System Preferences.
2. Choose View > Network.
3. Click the PPP tab.
4. Click the PPP Options button.
5. Deselect "Connect automatically when needed".
6. Click OK.

Thereafter, connect to the Internet manually before using the feature that requires Internet access. You can do this using Internet Connect or the modem menu bar item. To display the modem menu bar item, click the Modem tab and make sure "Show modem status in menu bar" is selected.

Mac OS X 10.2: Changing Default Voice Does Not Affect Speech Service

This document explains what to do if the speaking voice does not change when you choose a different Default Voice.
This article has been archived and is no longer updated by Apple.

Symptom

The voice does not change after changing the Default Voice in the Speech preference pane.

Solution

Use one of the following workarounds:

- Log out, then back in.
- Restart the computer.

Published Date: Feb 17, 2012

Mac OS X: Files With Leading Period Appear on a Windows-Compatible PC

This article has been archived and is no longer updated by Apple.

Files whose filenames begin with a period (for example, ".filename") are normally invisible in Mac OS X. However, if you share disks between a Mac and a Windows-compatible computer, you can see the files. They should not be deleted.

Note: This document applies to Mac OS X 10.0 through 10.3.9.

Symptom

Files whose filenames begin with a period "." appear on the disk when viewed with a Windows-compatible computer.

This can occur when you use writable, portable media with both a Mac and a Windows-compatible computer.

Solution

The files can be safely ignored and should not be deleted.

To make the files invisible when the disk is used on a PC, you can set the "hidden" attribute for the files within the view options. Refer to the Microsoft Windows Help documentation for instructions.

Published Date: Feb 17, 2012

Mac OS X 10.2: "...System Folder has been modified by a newer version of Classic..." Alert

When you open the Classic environment for the first time after performing an Archive and Install installation, an alert message may appear. This happens because the Mac OS 9 System Folder contains Classic components updated by the later version of Mac OS X.

This article has been archived and is no longer updated by Apple.

Symptom

This message appears the first time Classic opens after an Archive and Install installation:

> "Your selected System Folder has been modified by a newer version of Classic, you can use the older enabler but this would be an unsupported configuration."

Note: If you click Try Anyway, this message will not appear again.

This happens when the version of Mac OS X 10.2 that is currently installed is earlier than the version previously installed.

Solution

Update to the version of Mac OS X you were using before the Archive and Install, or later.

Alternatively, or if you do not plan to update to the same or later Mac OS X version, you can reinstall Mac OS 9. Refer to these technical documents for more information, depending on what type of Mac OS 9 install or Mac OS X Restore disc you have:

42929: "**Software Restore: How to Use Restore Discs With Mac OS X 10.2**"
106294: "**Mac OS X: How to Reinstall Mac OS 9 or Recover From a Software Restore**"

How to tell Mac OS X Mail to forget remembered addresses

This article has been archived and is no longer updated by Apple.

Mail's Address History (Mac OS X 10.2.8 or earlier) or Previous Recipients (Mac OS X 10.3 and 10.4 or later) feature helps you automatically complete email addresses as you type them. Learn how to tell Mail to forget an address.

Mac OS X 10.2, 10.3, 10.4 or later

1. Open Mail.
2. From the **Window** menu choose Address History or Previous Recipients.
3. Select the address(es) to remove, then click Remove from History.

Mac OS X 10.1.5

Open Address Book, locate and select the address(es) to remove, and click Delete.

Published Date: Oct 10, 2016

Mac OS X: Time Is Incorrect After Resetting PRAM

This document explains what to do if the computer's clock is incorrect after resetting PRAM.
This article has been archived and is no longer updated by Apple.

Symptom

After resetting PRAM, the computer's clock is off by up to 13 hours.

This happens if the computer can also start from Mac OS 9.

Solution

A Mac OS 9 System Folder is present

Start from your Mac OS 9 System Folder. Refer to technical document 106667, "**How to Switch Between Mac OS 9 and Mac OS X**", for instructions.

Once started from Mac OS 9, start up from Mac OS X again.

A Mac OS 9 System Folder is not present

Use the Data & Time preference pane to correct the time setting. You can also use this solution if a Mac OS 9 System Folder is installed but you never start from it.

Published Date: Feb 17, 2012

Mac OS X: "Error in user parameter list (-50)" With MS DOS-Formatted Volume

This document explains what to do if the alert "Error in user parameter list (-50)" appears when working with an MS-DOS-formatted volume.
This article has been archived and is no longer updated by Apple.

Symptom

An alert appears that states:

> "Error in user parameter list (-50)" (minus 50)

The message may also include the name of a file you are using or copying.

This happens when copying a file to an MS-DOS-formatted disk or modifying a file on the disk.

Solution

Note: You can verify that the volume is formatted as a MS-DOS disk by selecting its icon in the Finder and choosing File > Get Info.

A file cannot be copied

Certain characters that can be used in a Mac OS X filename are not allowed in MS-DOS filenames. This can prevent the file from being copied, and can
occur when a filename contains non-printing ACSII characters, or any of these characters:

? / \\ < > " | > *

Remove these characters from the names of the files before you copy.

Alternatively, for a longer-term solution, reformat the volume as Mac OS Extended (HFS Plus). Be sure that any important data on the volume has been backed up first (after renaming any files with characters mentioned above), and that any other computer you will use the volume with works with Mac OS Extended format disks.

A file cannot be modified

If the alert appears when you try to change a file, try copying it to the computer's hard disk first, then copying it back when you are finished.

Alternatively, consider formatting the volume as Mac OS Extended as described above.

Mac OS X 10.1.5, 10.2: Application Stops Printing, Cannot Open Files

After printing several times from an application that has been open for a long time, the application may not print or open files.
This article has been archived and is no longer updated by Apple.

Symptom

An application cannot print or cannot open files (or both).

This happens when the application has been open for a long time and has already printed several times.

Solution

As a workaround, quit the application and open it again.

If you have a Hewlett-Packard or Lexmark printer that uses a PDE plug-in, contact the manufacturer of your printer for an updated version of the PDE file that addresses this issue, or update to the latest version available for your printer.

If you do not use an HP or Lexmark printer, follow these steps:

1. Click the Finder icon in the Dock.
2. Choose Go > Go to Folder.
3. Type: `/Library/Printers/PPD Plugins/`
4. Click Go. The PPD Plugins folder opens.
5. Choose Edit > Select All.

   Note: If you use a printer that is not an HP or Lexmark printer but relies on software in this folder, deselect the item(s) specifically related to your printer.

6. Drag the items to the Trash, then empty the Trash.

Published Date: Feb 17, 2012

Mac OS X 10.2: How to install the BSD subsystem after Mac OS X 10.2

This document explains how to custom install the BSD package after Mac OS X 10.2 has already been installed. Unless you choose not to install it, the BSD subsystem is installed by default when you install Mac OS X.

This document applies to Mac OS X 10.2 through 10.2.8. For Mac OS X 10.3 Panther information, see this document.
This article has been archived and is no longer updated by Apple.
The steps listed here are for use with the Mac OS X 10.2 Install CD, which you either purchased or was included with your computer in addition to Restore discs. If you are using a Restore DVD disc, stop here and see Mac OS X 10.2 - Restore DVD: How to Install Individual Third-Party Software Items Without Erasing.

1. Insert the Mac OS X 10.2 Install Disc 1. You do not need to start up from the Install CD.
2. The Welcome window appears. Double-click the Optional Installs folder.
3. Double-click the BSD Subsystem.pkg icon. The Installer application opens.

Tip: If you do not see this package, choose File > Find and search the CD for BSD.pkg.

4. Enter your account password when prompted.
5. Select the destination volume that contains Mac OS X 10.2.
6. Click Continue. The selected software installs.
7. Once installation is complete, reinstall the Mac OS X 10.2 Combo Update (such as Mac OS X 10.2.8 Combo Update) that is equivalent to the version of Mac OS X you are using.
8. After updating, you should also download and install any Apple Security Updates that are available.

Mac OS 9.2.2 (Italian): Alert "-15008" When Using Modem

An alert message appears when using Mac OS 9.2.2 with a dial-up modem. This may happen after using the Italian Restore DVD included with the eMac (ATI Graphics) and Power Mac G4 (Mirrored Drive Doors 2003) computers.
This article has been archived and is no longer updated by Apple.

Symptom

This alert message appears when you try to use your modem:

"-15008, Consulta la Guida Apple O la documentazione di Remote Access per ulteriori informazioni Software Update preferencee pane questo tipo di errore."

This can happen when:

- The computer has a Combo drive.
- You have restored software from certain Italian Restore DVDs.
- The computer is started up from Mac OS 9.2.2.
- You are trying to connect to the Internet with a dial-up modem.

Solution

Follow these steps:

1. Move the file "Modem Preferences" to the Trash. It's located in the Preferences folder, which is inside the Mac OS 9.2.2 System Folder.

Important: Be careful not to delete the file "Preferenze Modem".

2. Empty the Trash, then restart.
3. After the computer restarts, open the Remote Access control panel and make sure your connection settings look right.

Note: The issue does not occur in Mac OS X.
Published Date: Feb 17, 2012

Mac OS X Mail: About PDF attachments

Learn how Mail handles PDF files attached to email.

This article has been archived and is no longer updated by Apple.

When you send or receive an email that has a PDF (Portable Document Format) file as an attachment, depending on the file's size, you may see its contents within the Mail message, or you may see a document icon.

If the PDF file contains two or more pages, Mail displays it as a document icon.

If the document is smaller, Mail displays the contents of the PDF file within the message window.

To change the way the PDF file is displayed in the current message window, Control-click the icon or visible portion of the PDF and choose "View in Place" or "View as Icon" as appropriate from the shortcut menu. Note that this only affects how you see the PDF in this message's window, it is not a permanent change.

Mac OS X 10.2: Kerberos Password Does Not Unlock Screen Effects

If a system is configured to perform Kerberos authentication when the user logs in, the Kerberos password does not work with Screen Effects password feature if it differs from the account password. Use the account password instead.
This article has been archived and is no longer updated by Apple.

Symptom

The Kerberos password does not dismiss Screen Effects.

This happens when the user logs in with Kerberos authentication and Screen Effects prompts for a password when dismissed.

Solution

To dismiss the screen saver, use the local (not Kerberos) account password of the logged-in user, or of a local Admin user account.

Published Date: Feb 17, 2012

Mac OS X 10.2.8 or Earlier: Network Preference Pane Missing DHCP, BootP Options; Cannot Change Settings

If the system configuration server process (configd) unexpectedly quits, DHCP and BootP choices may not be available in the TCP/IP tab of the Network preference pane, and you may not be able to change Network settings.
This article has been archived and is no longer updated by Apple.

Symptom

You see one of these symptoms when AirPort or Built-in Ethernet is selected in the Show pop-up menu of the Network preference pane:

- After you click the TCP/IP tab, DHCP and BootP do not appear as choices in the Configuration pop-up menu. The choices that appear include Manually, PPP, and AOL Dialup.
- This alert message appears when you click Apply Now:

  "The System Configuration server (configd) is not available."
- When you open the Network preference pane, a status message of "Loading Network" appears for a long period of time.
- These messages may appear in the Console log:

  - "Error: Configuration monitor failed to connect to configd server"
  - "Error: Couldn't commit network database changes."
  - "Error: Unable to obtain write access for system configuration database."

Solution

As a workaround, restart the computer.

If restarting doesn't fix the issue, try this:

1. Open Terminal (/Applications/Utilities). Type these lines in Terminal (one at a time), following each line with a Return. Note that there is a space after each ".xml" below, but no space in "SystemConfiguration".

Note also that after the first "sudo" command you will be prompted for your admin password.

```
cd /var/db
sudo mv NetworkInterfaces.xml NetworkInterfaces.old
cd SystemConfiguration
sudo mv preferences.xml preferences.old
sudo mv com.apple.airport.preferences.xml  com.apple.airport.preferences.old
```

2. Quit Terminal when finished, then restart again.

This document will be updated as more information becomes available.

Published Date: Feb 17, 2012

Mac OS X: Software Update Unexpectedly Resumes Automatically Checking for Updates

Software Update automatically checks for updates after installing some update packages, even if you had previously turned off automatic checking.
This article has been archived and is no longer updated by Apple.

Symptom

Software Update automatically checks for updates, even though you had previously deselected this feature.

Solution

This is normal behavior. You may turn off automatic checking at any time, but some Apple software updates will turn the feature back on.

To turn off automatic checking as you did before, you would follow these steps:

1. Choose Apple Menu > System Preferences.
2. Choose View > Software Update.
3. Click the Update Software tab, if not already selected.
4. Deselect the "Automatically check for updates when you have a network connection" checkbox.

Published Date: Feb 17, 2012

Mac OS X 10.2.8 or Earlier: Disk Copy Opens When Blank Optical Media is Inserted

Disk Copy may open when you insert a blank optical disc (CD-R, CD-RW, DVD-R, and DVD-RW media). You can change this behavior by using the CDs & DVDs preference pane.

Note: This document applies to Mac OS X 10.2.8 and earlier.
This article has been archived and is no longer updated by Apple.
The CDs & DVDs preference pane allows you to choose which application opens when you insert blank optical media. One of the choices is Disk Copy. If Disk Copy opens and you dismiss the window, the disc will eject. This is normal and does not mean there is an issue with the disc or the optical drive.

To change your settings, follow these steps:

1. Choose Apple menu > System Preferences.
2. Choose View > CDs & DVDs.
3. Select the desired choice in the "When you insert a blank CD" and "When you insert a blank DVD" pop-up menus. If you are not sure what to select, choose "Ask what to do."

Published Date: Feb 19, 2012

Mac OS X 10.2, 10.3: You put in a blank disc, but it doesn‘t appear

It's OK if a blank disc (such as a CD-R, CD-RW, or DVD-R) does not appear on the desktop or in the Finder after you insert it. One of your settings most often causes this, not an actual issue with the computer.
This article has been archived and is no longer updated by Apple.
Note: Other applications, including iTunes and Disk Copy, can still use the disc even if it doesn't appear on the desktop.

When you insert a blank disc, your CDs & DVDs preference setting will determine what happens next. If it is set to Ignore, then nothing happens in the Finder.

Follow these steps to change the setting:

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **CDs & DVDs**.
3. Choose an action other than Ignore from the first two pop-up menus. For example, you can choose Open Finder.

The next time you insert a disc, it should appear as you expect.
Published Date: Oct 10, 2016

Mac OS X: Internet Sharing Stops When Computer Is in Sleep Mode

Internet sharing is not active when the computer is in sleep mode. Services restart when the computer wakes up.
This article has been archived and is no longer updated by Apple.

Symptom

Internet sharing does not work when the computer is in sleep mode.

Solution

Because of this, Mac OS X 10.4 and later prevent idle sleep when Internet Sharing is active. For earlier systems, just don't let the sharing computer sleep:

1. Choose Apple menu > System Preferences.
2. Choose View > Energy Saver.
3. Drag the "Put the computer to sleep when it is inactive for" slider to Never.

Note: The display sleep setting does not affect this issue. You can set it to whatever you like.
Published Date: Oct 10, 2016

Mac OS X: Preference Pane Icons Are Missing

If some of the expected icons don't show up in the System Preferences application, this document explains how you can fix it. This document applies to Mac OS X 10.0 through 10.2.8.
This article has been archived and is no longer updated by Apple.
To see System Preferences icons:

1. Quit System Preferences.
2. Click the Finder icon in the Dock.
3. Choose Go > Go To Folder.
4. Type: ~/Library/Caches
5. Click Go.
6. Locate this file: "com.apple.preferencepanes.cache"
7. Drag it to the Trash.
8. Open System Preferences.

Published Date: Oct 10, 2016

Mac OS X 10.3: Mail - How to Use a Secure Email Signing Certificate (Digital ID)

Learn how Mail in Mac OS X Panther can import a secure email signing certificate that you can use to protect S/MIME messages.
This article has been archived and is no longer updated by Apple.
Mail in Mac OS X Panther can use a secure email signing certificate to protect S/MIME messages. A secure email signing certificate is sometimes referred to by other names, including: Digital ID, secure certificate, Certificate Authority key, private key, or .p12 file. For additional information about what a secure certificate, private key, or Digital ID is, contact the third-party company you obtained the certificate, ID, or key from.

Mac Help includes more information about some topics covered in this document. With Mail open, from the **Help** menu, choose **Mail Help**.

Obtaining a secure certificate

To get a key, you must first obtain a secure signing certificate from a third-party, such as VeriSign or Thawte Communications. Certificates are usually PKCS12-format files. Their filename extension is ".p12". To obtain the certificate, you normally fill out an online form using a Web browser. You may need to pay for the certificate service.

Certain Web browsers, such as Safari and Microsoft Internet Explorer, may not allow you to order the certificate. In that case, try a different browser, such as Netscape Navigator or Mozilla.

Note: Your certificate file (ends with ".p12") may not be automatically downloaded to your Mac OS X volume. You may need to use your browser's preferences to back up the certificate, and save it to the desktop or a different location. After that, you can import it using the steps below.

Importing the secure certificate into Mail

1. Double-click the .p12 file to open it. Keychain Access opens and imports the certificate. If this does not happen, drag the file onto the Keychain Access application icon (/Applications/Utilities).
   Note: If the certificate includes a private key, you'll need to enter the password for the key.
   Note: New certificates appear in Keychain Access, including your private key, your public key, and keys leading to a root Certificate Authority (CA) key.

2. Quit Keychain Access.
3. Open Mail. The keys are now available for use with S/MIME messages.

Sending a signed message

To send a signed message, you only need a private key for the sending email address. A signed message offers a lower level of security than an encrypted message, but a greater level of security than an unsigned message.

In the Compose window:

-
  means the message will be signed
-
  means the message will **not** be signed

Note: You can send a message that is both signed and encrypted.

A signed message includes this line above the body of the message:

Sending an encrypted message

You can encrypt a message if you have:

- the private key of the sending email address
- the public key of each recipient

An encrypted message offers a better level of security than a signed message. Once the appropriate certificates are available, a lock button appears in the Compose window (see below). It allows you to securely encrypt the message. **Important:** The message is encrypted only if you have the public key of the recipient.

Encrypted messages are saved in your Sent mailbox as an encrypted message.

In the Compose window:

-
  means the message will be encrypted
-
  means the message will **not** be encrypted

Note: You can send a message that is both encrypted and signed.

Importing another person's public certificate (key)

Importing another person's public key is easy. Just view a signed or encrypted message and Mail will automatically import the person's public key. You can use Keychain Access to view or edit it.

Mac OS X 10.3: Troubleshooting Classic startup with Fast User Switching

The Classic environment can only be opened by one account at a time in Mac OS X Panther 10.3. The symptom described in this document may occur when more than one account is logged in and trying to use a Classic application.
This article has been archived and is no longer updated by Apple.

Note: This document applies to Mac OS X 10.3 through 10.3.9.

Symptom

You can't start the Classic environment or use Classic applications. This message appears:

> "Classic cannot start because it is already running. Classic is being used on the Mac by the user '<name of user>'."

This happens when another account is also logged in and is using the Classic environment.

Solution

Note: To use this solution you need to be able to log in to the account that is currently using Classic.

1. Switch to the account that is using the Classic environment.
2. Click the Finder icon in the Dock, or anywhere on the desktop.
3. Choose System Preferences from the Apple menu.
4. Click the Classic icon.
5. Click Stop. See Figure 1.

Figure 1

7. Switch back to your own account and use Classic.

How to search the System Directory with Find in Mac OS X 10.3

The Finder's Find feature can search many places on your computer's hard disk, but it doesn't search in the System directory by default. Learn how to configure Find to search /System.
This article has been archived and is no longer updated by Apple.
To search in the System directory using Find:

1. Click the Finder icon in the Dock.
2. From the **File** menu, choose **Find**.
3. Choose Specific Places from the "Search in" pop-up menu.

4. Click the Add button.
5. Navigate to /System, then click Open.

6. Make sure that your Mac OS X disk or volume is also selected in the list of places to search.

The System directory should now available in the list of Specific Places.

To remove it from the list, select /System, then click Remove.

Tip: Searching the System directory can greatly increase the time it takes to perform your search. You should not normally need to search the /System directory because it only contains system software files, which you should not normally remove or modify.
Published Date: Oct 10, 2016

Mac OS X 10.2: Internal v.92 Modem Does Not Disconnect When Idle

The computer's internal v.92-based modem does not disconnect when idle, even if you've selected that option in Network preferences. This document applies to Mac OS X 10.2.4 through 10.2.8.
This article has been archived and is no longer updated by Apple.

Symptom

Your computer's internal modem does not disconnect when idle, even if you've selected that option in Network preferences.

This happens when:

- You connect to the Internet using the internal modem.
- The Apple Internal 56K Modem (v.92) modem script is chosen in the Modem tab of Network preferences.
- The checkbox labeled "Disconnect if idle for __ minutes" is selected in the PPP Options sheet of Network preferences.

Solution

Disconnect from the Internet manually by opening Internet Connect and clicking Disconnect.

You could also use a different modem script that allows the modem to disconnect when idle. **Important:** Using a different script may mean that certain v.92 features will not work, but you will still be able to connect to the Internet.

1. Choose Apple menu > System Preferences.
2. Choose View > Network.
3. Choose Internal Modem from the Show pop-up menu.
4. Click the Modem tab.
5. Choose Apple Internal Modem (v.90) from the Modem pop-up menu.
6. Click Apply Now.

Mac OS X 10.2: Shared Fax Modem Appears in Print Center But Doesn‘t Work

This article has been archived and is no longer updated by Apple.

Mac OS X 10.3 includes built-in faxing, and allows you to share your fax modem with other Mac OS X 10.3 users. While the shared fax modem will be visible to Mac OS X 10.2 users in the Print Center, only Mac OS X Panther users will be able to use the shared fax modem.

For more information about built-in faxing, please see Printing and Faxing Support.

Symptom

The Shared Fax Modem is viewable in the Print Center as an "Internal Modem". Its type is listed as "Fax Printer". You try to send a job to the shared fax modem, but it is never sent.

This happens when the fax modem is hosted by a computer using Mac OS X 10.3 or later, but your computer is using Mac OS X 10.2.

Products Affected

- Mac OS X 10.2 through Mac OS X 10.2.8 (client)
- Mac OS X 10.3 (host)
- Other operating systems that use the Common UNIX Printing System (CUPS)

Note: Mac OS X 10.3 users are not affected by this issue.

Solution

While users on older operating systems may be able to see Shared Fax Modems in their Print Center, only Mac OS X 10.3 users will be able to use the modem.

iCal 1.5.1: Updating the Date or Time

If iCal doesn't seem to acknowledge that you've changed your computer's date or time, quit it and open it again.

This article has been archived and is no longer updated by Apple.

Symptom

After switching between a 24-hour and 12-hour clock in Date & Time preferences, iCal calendars may not reflect the change.

Some alarms may not work after changing the date or time in Date & Time preferences.

Solution

Quit iCal and open it again after making changes in the Date & Time System Preference pane.

Bluetooth, iSync: Sony Ericsson P800, P900 Listed With No Name or as Miscellaneous

After pairing via Bluetooth for the first time, your Sony Ericsson P800 or P900 mobile phone (http://www.sonyericsson.com/) may appear in the Bluetooth device list, but with no name or as a Miscellaneous device.
This article has been archived and is no longer updated by Apple.

Symptom

- You cannot sync the phone using iSync.
- The phone appears in the Bluetooth All list as an unnamed device. If you add the device, is it appears as a Miscellaneous device.

This happens if you initiated pairing from the phone the first time you use it, or after choosing Master Reset on the phone.

Note: Master Reset refers to a function of the phone. It is not related to the iSync Reset All Devices function.

Solution

Initiate pairing from the computer, then pair the phone with the computer.

1. Delete the unnamed device from the All list For more information, see technical document 86471, "**Bluetooth: How to Delete a Paired Device**".
2. Delete the computer from the list of paired Bluetooth devices on the phone. Refer to the phone's manual if you need help.
3. Pair the phone with the computer. For more information, please see technical document 51770, "**How to Pair Your Computer With Bluetooth-Enabled Devices**".

Mac OS X 10.2.8: Blue or Dark Screen After Updating

After installing Mac OS X 10.2.8 (Build 6R65) on a Macintosh that uses an ATI graphics chipset, including Power Macintosh G3 and PowerBook G3 Series (Bronze Keyboard) computers, the screen may look blue or dark in some applications.
This article has been archived and is no longer updated by Apple.

Symptom

In some applications, including Microsoft Entourage and Disk Utility, the display's image is blue or "melts".

When restarting or in some applications, the screen is black, as if the computer had been turned off.

This can happen if your ATI graphics chipset-based computer has 192 MB or more of RAM, and you install Mac OS X 10.2.8 (Build 6R65).

Solution

Download and install Mac OS X 10.2.8 (Build 6R73), or later. You can get it using the Software Update feature in System Preferences. For more information about using Software Update, see technical document 106704, "Mac OS X: How to Update Your Software".

Mac OS X 10.2.8 (Build 6R73) is known to resolve the issue for PowerBook G3 Series (Bronze Keyboard) computers. If you have a different computer and the issue persists, follow these steps:

1. Open Terminal (/Applications/Utilities/).
2. Type:

```
sudo mv /System/Library/Extensions/AppleNDRV/ATIDriver.bundle /Users/Shared/
```

Note: There is a space after "mv" and another after ".bundle".

3. Press Return.
4. Type: `sudo touch /System/Library/Extensions`
5. Press Return.
6. Restart the computer.

If desired, you can remove ATIDriver.bundle from the Shared folder.

This document will be updated as more information becomes available.

Can‘t log in after installing Mac OS X 10.2 over 10.3

You may not be able to log in to Mac OS X 10.2 if you perform an Archive and Install installation over Mac OS X 10.3 Panther.
This article has been archived and is no longer updated by Apple.
This can happen if you chose to preserve user and network settings during the Mac OS X 10.2 installation.

To fix this, either reinstall Mac OS X 10.3 Panther, or perform another Mac OS X 10.2 Archive and Install installation but do not preserve user and network settings.

Usually, it's best to use the most current version of Mac OS X instead of an earlier version.
Published Date: Oct 11, 2016

Mac OS X 10.3: Default Personal Web Sharing Page Not Advertised

Mac OS X 10.3 does not advertise the default Personal Web Sharing page, which is in English, over Rendezvous. Personal Web Sharing, which can be turned on in Sharing preferences, lets you share webpages on your local network and on the Internet.

Note: This document discusses an advanced topic.
This article has been archived and is no longer updated by Apple.
Mac OS X 10.3 does not advertise the default Personal Web Sharing page over Rendezvous, which, for each account, is located at ~/Sites/index.html.

Although the webpage is not advertised over Rendezvous, you can still view it using the URL that appears in Sharing preferences (such as http://127.0.0.1/~accountname/).

If you change the default account webpage, it will be advertised after the computer restarts. You can then view it with the Rendezvous browser in Safari. Follow these steps:

1. From the **Safari** menu, choose **Preferences**.
2. Click the Bookmarks button.
3. Click the three checkboxes labeled "Include Rendezvous".

Note: The computer's webpage (located at /Library/WebServer/Documents) is never advertised over Rendezvous.

Mac OS X 10.3: Mail - Messages Missing or Incomplete, Can‘t Get or Send Mail After Using Mac OS X 10.2 Mail

Some advanced users configure Mac OS X to use a home folder besides the default one. These users shouldn't switch back and forth between Mac OS X Panther Mail and Mac OS X 10.2 Mail.
This article has been archived and is no longer updated by Apple.

Symptom

Mac OS X 10.2 or 10.3

- Mail cannot get or send messages.
- Your In mailbox appears empty even though you know messages should be there.
- Messages in a mailbox appear incomplete, or seem to run together.

This happens if:

- You use the same home folder for both Mac OS X 10.3 and Mac OS X 10.2 Mail.
- Mac OS X 10.3 and 10.2 are installed on different volumes.
- You start from your Mac OS X 10.3 volume, use Mail, then start from your Mac OS X 10.2 volume and use Mail again.

Note: Your home folder has the same name as your account's short name. It is in the Users folder.

Note: IMAP mailboxes stored on a server are not affected by this issue.

Solution

You can use the same home folder for Mac OS X 10.3 that you used for Mac OS X 10.2; however, if you do, you shouldn't start from Mac OS X 10.2 and use Mail after installing Mac OS X 10.3 and using Mail.

To avoid the issue, upgrade to Mac OS X 10.3 and don't use Mac OS X 10.2 on the same computer. If you still don't see email messages, from the **Mailbox** menu, choose **Rebuild**.

Mac OS X Address Book: About SMS messaging and new phone models

Address Book includes a short message service (SMS) feature that works with many mobile phones.
This article has been archived and is no longer updated by Apple.
Some new phone models use new methods of communication with Mac OS X. Therefore, not all new phones will be able to use the SMS messaging features or phone number dialing features of Address Book.

You can use Address Book to manage the phone's contacts with iSync, though.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X: Common Pointer Icons and What They Mean

Learn about common pointer (cursor) icons that you see in Mac OS X.
This article has been archived and is no longer updated by Apple.

Mac OS X 10.1 and earlier	Mac OS X 10.2 and later	Description
		Arrow pointer When you see this icon, you can move, copy, select, or drag items.
		Progress indicator The progress indicator appears when an application needs some time to finish a task. In Mac OS X 10.2 or later, this pointer appears in applications that need you to wait. If this pointer appears a long period of time, the application may have stopped responding or "crashed."
		Watch cursor The watch cursor may appear instead of the progress indicator in some stand by situations, such as with a Classic application.
		Progress indicator Some applications use this alternate spinning cursor.
		Link pointer The link pointer appears in Mac OS X applications when you move the pointer over a hypertext link, such as http://www.apple.com.
		I-beam The I-beam, or insertion point, appears when you can edit, type, or select (highlight) text in a particular area.
		Alias pointer The alias pointer means you are making an alias of the selected item. This happens if you press Option-Command while dragging an item.
		Copy pointer The copy pointer means you are copying or duplicating the selected item without moving the original. In the Finder, this pointer appears when you drag an item to a different volume, or to the same volume while pressing the Option key.
		Shortcut menu pointer This pointer means that you can click the mouse button to see a shortcut, or contextual, menu. You can hold the Control key on your keyboard and click the mouse button to see these menus when they are available.
n/a		**Prohibitory pointer** This pointer means you can't do the action you're trying to do, such as attempting to move a file to a location where you don't have permission make changes.
		Resize pointer Variations of this cursor appear when you can resize something, such as a window column in the Finder, or a sidebar in iTunes.
		Screen capture pointer To take a screen shot of a selection of the screen, press Command-Shift-4.
		Screen capture pointer To take a screen shot of a particular window, press Command-Shift-4, release those keys, then press the Space bar.

iSync: Data Loss After Using Terminal to Allow Unsupported Calendar Syncing

If you previously used Terminal to modify iSync 1.1 for unsupported calendar syncing, you may lose data or duplicate data when you sync your phone using iSync 1.2.1 or later.
This article has been archived and is no longer updated by Apple.

Symptom

Calendar data is lost or duplicated when you sync your phone with iSync 1.2.1.

You have previously used Terminal to allow iSync 1.1 to sync calendar data with an unsupported mobile phone.

Solution

There are two solutions. Review both and use the best for your situation.

If iSync 1.2.1 or later is not yet installed

Important: Following these steps removes the third-party patch and preserves calendar data. However, you will lose any speed dials, ring tones, or other special features attached to your phone contacts. See technical document 93182, "**iSync: Use Caution Before Choosing Reset All Devices Command**".

1. Select the phone in the iSync window.
2. From the **Devices** menu, choose **Remove Device**.
3. Download and install iSync 1.2.
4. Sync with other devices.
5. From the **Devices** menu, choose **Add Device** to add the phone to the list.
6. Select the phone in the iSync window.
7. When the Device pane appears, choose "Erase data on device" from the "On first sync" pop-up menu.
8. Sync the phone with your computer and other devices.

If iSync 1.2.1 or later is already installed

This solution disables, but does not remove, the patch or calendar data that may have been synced to the phone previously. You may see duplicate calendar events.

1. Select the phone in the iSync window.
2. From the **Devices** menu, choose **Remove Device**.
3. Sync with other devices.
4. From the **Devices** menu, choose **Add Device** to add the phone to the list.
5. Click the Device drawer.
6. Deselect Calendar synchronization.
7. Sync the phone with your computer and other devices.

Mac OS X 10.3: Fax address is incorrectly completed

When typing a fax recipient's name, Mac OS X Panther will complete the name and phone number if the contact's name is in Address Book. If similar or duplicate contacts are in Address Book, the wrong one may be chosen for you.
This article has been archived and is no longer updated by Apple.

Note: This document applies to Mac OS X 10.3 through 10.3.9.

Symptom

When typing the name of a fax recipient in the To: field, an Address Book entry is filled in automatically. The contact that is filled in may not be the one you intended.

This happens when two or more entries in Address Book have the same first or last name.

Solution

Select the recipient this way instead:

1. Click the button to the right of the To: field. The contacts window appears.
2. Select the recipient.
3. Click the To: button.
4. Close the window.

Mac OS X 10.2.8, G5: About the Mac OS X 10.2.8 (G5) Update

This software updates Mac OS X 10.2.7 (G5) to version 10.2.8 (G5).

Important: This update works only with Power Mac G5 computers. To update a different kind of computer to Mac OS X 10.2.8, refer to technical document 25524, "**Mac OS X: About the Mac OS X 10.2.8 Update**".

This article has been archived and is no longer updated by Apple.
Important: Read Before Installing

1. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

2. To install Mac OS X 10.2.8, you must enter the password for an administrator account. The password cannot contain a space or special characters typed by pressing the Option key.

   If you need to change an administrator account password, choose Apple menu > System Preferences; then choose View > Accounts. Select the account name and click Edit User. Type the current password and press Return, then type the new password in both text boxes. Click OK when you are done.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Featured Software to install.

Installation

There are two ways to update to Mac OS X 10.2.8 (G5): using Software Update or a standalone installer.

Software Update Installation

You may have been referred to this document by Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

An installer is also available from Apple Featured Software (http://www.apple.com/swupdates/). Mac OS X 10.2.8 (G5) Update updates Mac OS X 10.2.7 (G5) to the later version.

Enhancements

These are some of the enhancements that are part of the Mac OS X 10.2.8 (G5) Update:

- The computer will now wake from sleep if both an AirPort Extreme card and some kinds of PCI cards are installed.
- iChat works better on AirPort networks.
- Adds support for these third-party disc burners: Logitech Corp. LCW-E48F 48x24x48x, MCE Lucid-SD DVD-R/RW Drive, Formac Devideon FWD1496-3DVD-R 4x, TDK DVD+/-R/RW Drive - DED+440, LaCie d2 CD-RW FireWire 52x32x52x
- Bluetooth devices are now available after the computer wakes from sleep.
- Some FireWire devices will work better if you connect them after disconnecting certain kinds of digital cameras.
- Keyspan Twin Serial adapters work better when connected to a USB 2.0 hub.
- FireWire devices, including iPod, are now available when the computer wakes from sleep.
- Prevents a kernel panic from happening if you start Classic with more than 2 GB of RAM installed.
- Improves stability when using the "Return to command state" modem string command (;) with an Apple Internal USB Modem (v.92).
- The Apple Internal USB Modem maintains better connections to some kinds of v.34 modems.
- Includes updated security services and the latest Security Updates.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

iCal 1.5.1 "Play Sound" alarms show two alarm messages

These things can happen after updating to iCal 1.5.1:

- iCal "play sound" alarms become "message with sound" alarms.
- Two messages appear for alarms that previously had one.

This article has been archived and is no longer updated by Apple.

This happens because your "play sound" alarms are converted into "message with sound" alarms.

iCal 1.5 or later allows you to attach different kinds of alarms to a single event. Earlier versions of iCal used separate alarms for "display message" and "play sound". iCal converts this type of alarm to a "message with sound" alarm, so that a persistent message is displayed at the time of the alarm in case you are away from the computer. If you already had one message attached to the alarm, you will see two after upgrading.

You can adjust the alarm or remove extra messages by following these steps:

1. Open iCal 1.5.1.
2. Select the event that has an alarm.
3. Open the inspector by choosing Window > Show Info.
4. Select the alarm you want to remove.
5. In the inspector, click the word "alarm" by the alarm you wish to remove. A pop-up menu appears:

6. Choose Remove Alarm from the pop-up menu.

Mac OS X: Palm HotSync, iSync Conduit don‘t work after Archive and Install installation

This article has been archived and is no longer updated by Apple.

After performing an Archive and Install installation, you should reinstall Palm Desktop software and the iSync Palm Conduit before syncing your Palm OS-based device.

After an Archive and Install installation, you might see this alert when you log in: "Transport monitor could not be launched because of a shared library error," and you can't sync with your Palm OS-based PDA.

Locate the "HotSync Libraries" file in your Previous System folder, and drag it to: /Library/CFMSupport/

Alternatively, or if your Previous System folder is not available:

• For iSync 2.0 or later (included with Mac OS X 10.4), enable Palm Conduit in iSync. Note that there are other steps in the process of setting up a Palm OS-based device, such as opening HotSync Manager and checking conduit settings. Check out this document.

• For iSync 1.5, reinstall Palm Desktop, which is available from this Palm website. If you use iSync with your Palm OS device, you will also need to reinstall the iSync Palm Conduit after Palm Desktop. The iSync Palm Conduit is available here.

Mac OS X: Shared printer‘s name is garbled in Printer Setup Utility

This article has been archived and is no longer updated by Apple.

The name of printer shared by a Windows-compatible PC might not make sense in the Printer Setup Utility (Mac OS X 10.3 or later) if the name contains certain characters.

Symptom

A shared printer's name appears as garbled text in the Printer Setup Utility. After adding the printer, you might not be able to print to it.

This happens when the printer's name contains high ASCII characters or 2-byte characters and is shared by a Windows-compatible PC.

Note: 2-byte characters are commonly used in Japanese, Chinese, and Korean fonts. High ASCII characters are "extended ASCII" characters that you typically type using the Option key. They are listed in table II of this webpage: (http://www.cdrummond.qc.ca/cegep/informat/Professeurs/Alain/files/ascii.htm).

Solution

The name of the shared printer should not include high ASCII characters or 2-byte characters. Change the name of the printer so that it only uses alphanumeric characters.

Alternatively, if you have a compatible printer driver, consider sharing the printer from your Mac instead.

Important: Mention of third-party websites and products is for informational purposes only and constitutes neither an endorsement nor a recommendation. Apple assumes no responsibility with regard to the selection, performance or use of information or products found at third-party websites. Apple provides this only as a convenience to our users. Published Date: Oct 11, 2016

Mac OS X 10.3: Update third-party video card drivers before installing

This article has been archived and is no longer updated by Apple.

Issue or symptom

After installing Mac OS X 10.3, or while started from the Mac OS X Panther Install CD:

- The image on the screen is much larger. Icons and windows don't seem to be the right size.
- There is no video on the display. It's dark even though the computer is turned on.
- There are fewer display resolutions and color depth choices in Display preferences.
- Only black and white or grayscale video appears.

This can happen if your display is connected to a third-party video card. The card and display worked fine with Mac OS X 10.2 or earlier.

Solution

Before you install Mac OS X 10.3 Panther, be sure to install updated drivers for any third-party video cards you use, even if you didn't have to do this for Mac OS X 10.2. "Third-party video card" means a card that didn't come from Apple when you bought your computer.

Contact the video card's manufacturer to see if they have updated the card's software or firmware drivers to work with Mac OS X 10.3. For best results, install the updated software or firmware before installing Mac OS X 10.3.

If the third-party card is the only one installed and the screen is dark when you start up the computer, you may need to reinstall the original video card temporarily, install Mac OS X 10.3, install the updated third-party drivers, then put your third-party video card back in the computer.

Additional information

If your video card's ROM (or firmware) is older than March 2001, Mac OS X 10.3 will not load the ROM driver during start up. Instead, it will try to load a newer software driver file if one is present. Make sure the installed driver works with Mac OS X Panther.

These are some third-party video card manufacturers' support websites where you may be able to find additional information:

- **ATI Technologies**: (http://www.ati.com/support/driver.html)

  Note: If your ATI video card came with your Mac OS X 10.3-compatible computer, this document does not apply.
- **ForMac**: (http://www.formac.com/webapp/support_start.php)
- **ixMicro**: This company in no longer in business. However, you may be able to locate drivers using an Internet search engine.
- **3Dfx**: (http://www.voodoofiles.com/3dfxhelp.asp)

  Note: The 3Dfx website may offer some drivers as a courtesy, but the company is no longer in business.

Important: Mention of third-party websites and products is for informational purposes only and constitutes neither an endorsement nor a recommendation. Apple assumes no responsibility with regard to the selection, performance or use of information or products found at third-party websites. Apple provides this only as a convenience to our users. Apple has not tested the information found on these sites and makes no representations regarding its accuracy or reliability. There are risks inherent in the use of any information or products found on the Internet, and Apple assumes no responsibility in this regard. iSync: Can‘t Sync With a Locked Motorola Phone

You'll need to unlock your Motorola phone (http://www.motorola.com/) before you sync via iSync. A locked phone may display a "locked" message or lock icon.
This article has been archived and is no longer updated by Apple.

Symptom

iSync does not sync with your Motorola phone. A message appears that says the "device is unavailable."

This happens when the phone is locked.

Solution

Unlock the phone, then sync via iSync. iSync cannot unlock the phone for you.

If you don't know how to unlock your locked phone, refer to the documentation that came with it, or contact Motorola for further assistance.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Changing owner or group in a Get Info window (Mac OS X)

This article has been archived and is no longer updated by Apple.

If your computer is bound to a network directory system with many user or group records, changing a file or folder's owner or group in a Get Info window may take some time.

Symptom

- Owner and Group information appears blank in a Get Info window, and a progress indicator (looks like a spinning gear) appears.
- Scrolling through the users or groups pop-up menu takes longer than expected.

This happens when the client is bound to a network directory system that has many user or group records.

Solution

When you authenticate to change the Owner or Group setting, the pop-up menu is populated with every user or group in the local and networked directory system.

Mac OS X 10.3 and 10.4 or later only workaround - enable free text entry

By default, Mac OS X 10.3 and 10.4 or later display users and groups in the local directory only.

Note: This advanced procedure requires manual editing of a value using the Terminal application. This information is provided for information purposes only. Apple does not provide any further technical support for this method. You should use this method only if you don't need to browse user or group listings.

Note: If multiple users have the same real name, this method selects the first one that it encounters in the network directory system.

1. Open Terminal (/Applications/Utilities).
2. Type, followed by Return:
   ```
   defaults write com.apple.finder FXDisableFullUserGroupListing true
   ```
3. Log out, then back in.

When you log in, the Owner and Group pop-up menus will be replaced with text-entry fields. You can now type in a known account or group short name or a real name.

Mac OS X 10.3 and 10.4 or later only - selecting a user or group that is not displayed

By default, Mac OS X 10.3 and 10.4 or later display users and groups in the local directory only. To select a user or group from the network directory:

1. In the Get Info window, click the Owner or Group pop-up menu depending on what you want to do.
2. Choose Other at the bottom of the menu.
3. In the User Listing window, select the user and group from the network directory list.

Note: The time required for the User Listing to appear depends on the number of user and group records in the network directory system.

This document will be updated when more information is available.

Mac OS X 10.3: Sometimes automatic PPP connection dialing doesn‘t work

Mac OS X Panther's automatic PPP connection feature usually works great. However, it might not work sometimes.
This article has been archived and is no longer updated by Apple.
Mac OS X can automatically dial your modem (PPP connection) when it needs to connect to your Internet Service Provider (ISP). For example, Mac OS X will connect for you when Safari or Mail need to access the Internet.

To enable this feature, do this:

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **Network**.
3. Click the PPP pane.
4. Click the PPP Options button.
5. Click the checkbox labeled, "Connect automatically when needed".

If automatic connection does not work

In some situations this feature may not work, even if it is turned on in Network preferences. These include:

When you cancel a PPP connection attempt when the modem is dialing, or you manually disconnect after an automatic connection

To fix this, you can change any modem setting, put the computer to sleep and wake it, change your network location, or restart the computer.

Tip: When this happens, the PPP option "Connect automatically when needed" still appears to be enabled.

After three failed automatic connection attempts

The auto-connect feature turns itself off if a PPP connection can't be made in three attempts. When this happens, it probably means there is an issue with your ISP's phone number, or with the phone cable or outlet. Make sure all the connections are correct, and try a phone with the same cord and outlet.

Tip: In this case, Mac OS X uses the next network port as set in Network preferences (such as AirPort or Ethernet) to connect to the Internet.

Once you have the correct phone number and a working connection, put the computer to sleep and wake it, change your network location, or restart the computer, to use automatic connection.

Mac OS X 10.3: Included PPDs for PostScript printers

Mac OS X 10.3 Panther installs PostScript Printer Description (PPD) files that you can use with many Apple LaserWriter and third-party PostScript printers. This document includes a list of included PPDs.
This article has been archived and is no longer updated by Apple.
The Mac OS X print architecture works with many Apple and third-party PostScript printers, specifically those that have these two characteristics:

- Are PostScript Level 2 or 3 printers
- Use PPD files to describe the set of features available for a specific PostScript printer or printer family

A PPD file typically describes a printer's features: paper-handling capabilities, the number of paper trays and their capacity, available paper sizes, and so forth. Even if your printer's PPD isn't installed, you can still use the Generic PPD to print documents.

Printer manufacturers create the PPD files for their printers. Mac OS X 10.3 includes them as a convenience to you. A list of PPDs for Apple, Brother, Hewlett-Packard, Lexmark, and Xerox printers appears below.

For information on inkjet printers, see "Mac OS X 10.3: Raster (Inkjet) Printer Drivers Included".

Location of PPD files on Mac OS X 10.3 Install Discs

English (EN) PPDs are installed as part of the Essentials.pkg on the Mac OS X 10.3 Install Disc 1. PPDs for other languages are installed from the Mac OS X 10.3 Install Disc 2.

Some printer features not available?

Bundled PPDs may not offer every feature of a printer, such as sheet feeders or built-in fax machines. If your printer has a feature that is not available, contact the printer manufacturer for more information regarding the use of that feature. In the case of the LaserWriter 16_600 PS Fax, for example, Apple does not include the built-in fax feature when that PPD is used with Mac OS X.

Included PPD files

This list is subject to change without notification. There may be PPD files included with Mac OS X 10.3 that are not included with Mac OS X 10.2 or earlier, and PPD files that are included with Mac OS X 10.2 but not Mac OS X 10.3. You may wish to check with your printer manufacturer for a later PPD file version.

Some PPD files are not completely localized for the languages listed, but still work with them.

For a list of language codes, see "Knowledge Base: Language Codes Used".

Tip: For Mac OS X 10.2 PPD files, see "Mac OS X 10.2: Included PPDs and Use of PostScript Printers."

Mac OS X 10.3, 10.4 and later: Fonts in Mac OS 9 System Folder aren‘t available to Mac OS X applications

This article has been archived and is no longer updated by Apple.

Fonts that are in your Mac OS 9 System Folder may not be available to Mac OS X Panther and Tiger applications until you select the System Folder in Classic preferences or start Classic.

Symptom

- Fonts are unexpectedly substituted in a Mac OS X application.
- Fonts you expect to be available to a Mac OS X application are not.

This can happen when your Mac OS 9 System Folder is on a different volume than Mac OS X, if there are multiple Mac OS 9 System Folders present, or if the font is a bitmap font or font suitcase that contains only bitmap fonts (please note that bitmap fonts are not available in Mac OS X).

Solution

Either start Classic before using the Mac OS X application, or follow these steps once:

1. Quit any open Mac OS X application that needs the font or fonts.
2. From the **Apple** menu, choose **System Preferences**.
3. In the resulting dialog, click Classic.
4. Click the Start/Stop button.
5. Select your System Folder in the list of available folders, even if it is the only choice.
6. From the **System Preferences** menu, choose **Quit**.
7. Reopen a Mac OS X application. Your fonts should be available (except for bitmap fonts).

Mac OS X 10.3 or later: About faxing via mobile phone or Bluetooth

You might be able to send or receive faxes via Bluetooth or a mobile phone and Mac OS X 10.3 Panther or later.
This article has been archived and is no longer updated by Apple.
However, the fax feature has not been tested over Bluetooth or with a mobile phone. This means that AppleCare does not offer telephone technical support for faxing via a third-party Bluetooth modem or mobile phone.

Mac OS X 10.3: Terminal Commands That Require Authentication Unlock Other Applications

In Mac OS X Panther, Terminal commands that unlock resources and allow you to perform certain functions that you might not otherwise be able to, such as `su` and `sudo`, share the logged-in account's credentials with any application that requests them. This includes System Preference panes that are normally "locked" to the user and require authentication. If this is undesirable, you can use Fast User Switching as a workaround.

This article has been archived and is no longer updated by Apple.
Example: A non-administrator user, such as a student in a school lab, is logged in. The user needs to perform a certain operation that requires administrator access. An administrator user, such as a teacher, opens Terminal and uses the `sudo` command to allow the student to perform the task. Mac OS X 10.3 differs from earlier versions of Mac OS X because the non-administrator user now has access to other resources. Among other things, this means that all System Preference panes are now unlocked for the logged-in user, regardless of the Security pane or master password settings.

To avoid sharing credentials, you can use Fast User Switching:

Enable Fast User Switching if it isn't on. Do this one time:

1. Log in with an administrator account.
2. From the **Apple** menu, choose **System Preferences**.
3. From the **View** menu, choose **Accounts**.
4. Click the Login Options button.
5. Select "Enable fast user switching".
6. Create another admin user account.

Then, follow these steps whenever you need to authenticate or unlock resources via Terminal:

1. Switch to the alternative account via the Fast User Switching menu.
2. Do what you need to in the Terminal.
3. Switch back to the original account.

Note: You can also reset session credentials by locking an unlocked System Preferences pane, such as Network preferences.

Mac OS X: Microsoft Office Test Drive Doesn‘t Stay Open

If a Microsoft Office Test Drive application closes immediately after it's opened, log in with an administrator account and open it once.
This article has been archived and is no longer updated by Apple.

Symptom

When you open a Microsoft Office Test Drive application, it closes immediately after it's opened.

This includes: Word, Excel, PowerPoint, and Entourage.

Solution

1. From the **Apple** menu, choose **Log Out**.
2. Log in with an administrator account. You may need to ask a person with an administrator account to do this.
3. Open one of the Microsoft Office Test Drive applications.
4. From the **Apple** menu, choose **Log Out**.
5. Log in using your own account.

Mac OS X 10.3 Mail: About SSL, IMAP accounts, and "Remember my decision"

Learn about accepting SSL certificates in Mac OS X Panther Mail.
This article has been archived and is no longer updated by Apple.

Symptom

Mail asks if you want to accept an SSL certificate for each IMAP account. This happens each time Mail opens, even if you click Remember My Decision.

Solution

As a workaround, follow these steps. You need to log in using an administrator account first.

1. Click "Show certificate" when Mail asks if you want to accept the certificate.
2. Press the Option key while dragging the certificate to the desktop. The certificate's icon appears on the desktop.
3. Add the certificate to your keychain by dragging its icon on top of Keychain Access. **Tip**: Keychain Access is located in the Utilities folder (/Applications/Utilities).
4. When Keychain Access opens, you may be prompted to select which keychain to import to. If this happens, choose a keychain and also select X509 Anchors.

Additional information

Mail will continue to ask if you want to accept an SSL certificate each time it opens if the certificate is an expired server certificate or is signed by an unknown certificate authority.

Changing the "Use Mac OS 9 Preferences" setting in Mac OS X 10.3

The Classic preferences option "Use Mac OS 9 preferences from your home" is dimmed (or grayed out) when Classic is running. You won't be able to change the setting until you stop Classic.
This article has been archived and is no longer updated by Apple.
To change this setting, log in with an administrator account. If you don't have an administrator account, or if your account is managed and you do not have access to change Classic preferences, a person with an administrator account will need to assist you.

After logging in with an administrator account, follow these steps:

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **Classic**.
3. Click Start/Stop.

4. Click Stop.
5. Click Advanced.
6. Modify the "Use Mac OS 9 preferences" option as desired.
7. Click Start/Stop.
8. Click Start.

iSync: About Syncing Large Amounts of Data at One Time

You may not be able to sync lots of calendar or contact information to some phones at one time. If this happens, sync less information at a time, or sync several times.
This article has been archived and is no longer updated by Apple.

Symptom

An alert appears when syncing a large amount of data to a phone at one time. The alert indicates which data type is causing the issue.

This can happen when syncing lots of calendars, or a few calendars each with lots of information and notes, or many Address Book contacts, or lots of contact images to some phones.

Solution

As a workaround, sync fewer contacts or calendars at one time. For example, sync just one iCal calendar.

Note: In Address Book, you can make a new group and move some of your contacts into it. Then, sync only that group of contacts.

Additional information

For the Sony Ericsson P800 phone only, the limit for data syncing is 2 MB for calendars and 500 KB for contacts. Contacts with images take up more space.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Document 17159, "**Locating Vendor Information**" can help you search for a particular vendor's address and phone number.

iSync: About D-Link Bluetooth USB adapter compatibility

This article has been archived and is no longer updated by Apple.

You can sync information via iSync and a Bluetooth device using a D-Link (http://www.dlink.com/) Bluetooth USB adapter.

Use D-Link USB Bluetooth Adapter part number DBT-120, revision B2 or later for best iSync compatibility. If you have an earlier version of the D-Link adapter, or a different brand, you may not be able to synchronize with some phones such as the Sony Ericsson P800.

Older versions of the adapter, such as revision A, work with compatible, older phones.

iSync: Bluetooth connection fails when syncing with Sony Ericsson P800 phone

You can fix your Bluetooth connection if it fails while syncing data to a Sony Ericsson P800 mobile phone.
This article has been archived and is no longer updated by Apple.
When you're syncing your Sony Ericsson P800 phone via Bluetooth, iSync tells you that the Bluetooth connection has failed.

Try the solutions listed below to restore the connection. Any step may restore the connection, but you should try them in the order presented until the issue is resolved.

Note: "Break pairing" below means first remove the device from the Bluetooth Devices list, then remove the computer from the phone's device list. It does not involve any physical force to the device or computer. For more information, see these technical documents:

86471: "Bluetooth: How to Delete a Paired Device"
51770: "How to Pair Your Computer With Bluetooth-Enabled Devices"

- Try to sync again.
- Turn the phone off and on, then try to sync.
- In iSync, remove the phone from the list of devices to sync, then add it back. Select "Merge data on first sync" when you do this.
- Restart the computer, then try to sync.
- Open iSync, then try to sync.
- Break pairing, and pair the phone with the computer again.
- Add the device to iSync again, choose Erase data on first sync, then try to sync.
- Break the pairing between the phone and computer again, perform a Master Reset on the phone, then pair again.

  Note: Master Reset is a feature of the Sony Ericsson P800 phone, not of iSync.

- Add the device to iSync again, then try to sync.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X 10.3: Repair Permissions Utility Reports Printer Configuration File Issue

Mac OS X Panther's Repair Permissions utility reports a permissions issue with the printer.conf file. You can safely ignore this message,
This article has been archived and is no longer updated by Apple.

Symptom

The Repair Permissions utility reports a permissions issue with the printer.conf file.

Solution

You can safely ignore this message. It is accurate, but not a cause for concern. It may appear again if you make changes with Printer Setup Utility.

Download and install Mac OS X 10.3.2 Update or later to avoid this situation.

Published Date: Oct 11, 2016

Mac OS X 10.3: QuickTime Registration Button Doesn‘t Work

Troubleshoot QuickTime preferences when the Registration button doesn't work.

This article has been archived and is no longer updated by Apple.

Symptom

The Registration button in QuickTime preferences doesn't work. You entered a high ASCII or 2-byte character in the Organization or Name field.

Note: 2-byte characters are commonly used in Japanese, Chinese, and Korean fonts. High ASCII characters are "extended ASCII" characters that you typically type using the Option key. They are listed in table II of this webpage: (http://www.cdrummond.qc.ca/cegep/informat/Professeurs/Alain/files/ascii.htm).

Solution

1. Click the Finder icon in the Dock.
2. From the **Go** menu, choose **Go to Folder**.
3. Type: `~/Library/Preferences`
   Note: The tilde character ("~") represents your home folder.

4. Find the file named "QuickTime Preferences" and drag it to the Trash.

Note: After you do this, re-enter your QuickTime registration to enable QuickTime Pro features. Avoid using high ASCII or 2-byte characters in the Organization or Name field. See technical document 42564, "**QuickTime Pro: How to Enter Registration Key in Mac OS X**" if you need instructions.

If you no longer have your key and registration information, see technical document 58453, "**QuickTime Pro Key: Getting a Lost Key Resent**"

Mac OS X 10.3: A disc doesn‘t appear in the Finder after you burn it

Learn how to troubleshoot a disc that doesn't appear in the Finder after you burn it, with Mac OS X 10.3 through 10.3.3.
This article has been archived and is no longer updated by Apple.
A disc that doesn't appear in the Finder after you burn it is probably OK if no alerts appeared while it was being burned. Simply eject the disc and reinsert it to make it appear in the Finder. You only need to do this one time after burning the disc. Eject the disc by pressing the Media Eject key or the F12 key.

Update to Mac OS X 10.3.4 or later to avoid this issue.

Tip: You can burn CD-R, CD-RW, and DVD-R discs depending on your computer's disc drive.

If the disc still doesn't appear, see technical document 25545, "**Mac OS X: When You Put in a Blank CD, It Doesn't Appear**".

Published Date: Oct 11, 2016

Mac OS X 10.3: Mail - Some Font Styles Appear in Compose Window but Not in Sent Messages

Some of the text formatting you make in Mac OS X Panther Mail messages may not be visible to your recipients.

Note: Email formatting features that work with Mail in Mac OS X 10.2 also work in Mac OS X 10.3, such as bold, italics, and text coloring.
This article has been archived and is no longer updated by Apple.
The Font panel in Mac OS X Panther includes many ways you can format your text. For more information about these features, choose **Mac Help** from the **Help** menu, then search on "Font panel".

In Mail, some of these text formats only appear in the Compose window, regardless of the font you choose or the email application the message's recipients use. People who receive your message will not see certain changes to the text, such as strikethrough and text shadowing, even though you see them.

Note: The Text Underline button (the first button on the left in the top row of buttons) works for messages sent to recipients whose email applications can display rich text. Recipients will see single underlines, but not double underlines or colored underlines.

To get a good idea of what the message's recipients will probably see, save the message before you send it, then open it from your Drafts mailbox. You can also look at the copy in your Sent mailbox if you've already sent it.

Figure 1 Font Panel Buttons

These Font panel features only work with Mail message drafts:

- Text Strikethrough button (the second button on the left in the top row of buttons)
- Text Shadow (the fifth button from the left in the top row of buttons)

Other Font panel features are dimmed (or "grayed out") for Mail messages. Even though you can use the controls, they have no effect on selected text. These controls work in other applications, though:

- Shadow Opacity slider (the slider directly to the right of the Text Shadow button)
- Shadow Blur slider (the middle slider)
- Shadow Offset slider (the rightmost slider)
- Shadow Angle wheel

If it's important that your recipients see these styles, consider composing your message in a different application that can use these Font panel features, such as TextEdit. Then, save the file in rich text format (RTF) and attach it to a Mail message.

Mac OS X 10.3: Keyboard Layout or Input Method Changes After Upgrade

After upgrading an existing Mac OS X installation to Mac OS X Panther, you may need to select your preferred keyboard layout or input method in International preferences.
This article has been archived and is no longer updated by Apple.

Symptom

Your previously selected keyboard layout or input method choice changes.

This happens after upgrading to Mac OS X 10.3 from an earlier version of Mac OS X.

Solution

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **International**.
3. Click Input Menu.
4. Select the layouts or input methods you wish to use.
5. Select "Show Input menu in menu bar" if desired. This allow you to quickly change between layouts or methods without opening International preferences.

Mac OS X 10.3 (Swedish): Address Book - How to Send SMS Messages Longer Than 68 Characters

Update to Mac OS X 10.3.4 or later to avoid an issue in which, when you use Address Book to send an SMS via a Bluetooth mobile phone, you can type more than sixty eight characters, but once you type the sixty ninth or greater, the message's Send button is dimmed (or "grayed out").
This article has been archived and is no longer updated by Apple.
To send a message of up to 160 characters with the Swedish version of Mac OS X 10.3 through 10.3.3, simply press the Delete key once at the beginning of each new message.
Published Date: Feb 17, 2012

Mac OS X 10.3: Printer Sharing shares both printers and faxes

This article has been archived and is no longer updated by Apple.

Sharing a printer in Mac OS X 10.3 also shares any faxes that appear in the Printer Setup Utility Fax List. **Note:** For information about this issue and Mac OS X 10.4, see this article.

When you share a printer, faxes that appear in Printer Setup Utility's Fax List are also shared. You can turn on printer sharing in Sharing preferences or Print & Fax preferences.

Shared printers appear in the "shared printers" section of the Printer List. Shared faxes appear in the "shared faxes" section of the Fax List.

Tip: From the **View** menu, choose **Show Fax List** to see your Fax List.

Note: The Windows Sharing feature in Sharing preferences shares printers via SMB, but does not share faxes.

You can avoid sharing faxes by deleting them from the Fax List.

To learn more about setting up printer sharing, Printer Setup Utility, or faxing, choose **Mac Help** from the **Help** menu, then search on the feature you're interested in.

Mac OS X 10.3: About Opening a File That‘s in a Hidden Directory

Learn how to open files from applications that are in a hidden (or invisible) directory (or folder).
This article has been archived and is no longer updated by Apple.
When you choose Open from a Mac OS X application's File menu, you can select from visible folders and directories.

To open a file that's in a hidden directory follow these steps:

1. From the application's **File** menu, choose **Open**. An Open window appears.
2. Press the Solidus ("/") key, commonly called the "forward slash key." A "Go to the folder" sheet and field appears.
3. Type the path to the directory or file that you want to open. **Note**: Mac OS X Panther may automatically complete the path as you type it.
4. Press Return.

Mac OS X 10.3: Kotoeri candidate window doesn‘t appear in Simple Finder

The Kotoeri Candidate input window does not appear in accounts that use Simple Finder.

Note: This document applies to Mac OS X 10.3 through 10.3.9.

This article has been archived and is no longer updated by Apple.
In Accounts preferences, an administrator can set another account to use Simple Finder. The Kotoeri Candidate input window does not appear in these accounts. You can make the window appear by following these steps:

1. From the Input menu, choose Kotoeri Preferences.
2. Click the Candidate tab.
3. Select the number of times a key should be pressed to show the Candidate window.
4. Choose a Candidate window font size.
5. Close the Kotoeri Preferences window.

Mac OS X 10.3, 10.4: FileVault - Home directory, Public folder may be unavailable

This article has been archived and is no longer updated by Apple.

Mac OS X 10.3 Panther and 10.4 Tiger's FileVault security feature prevents other users from accessing your home directory.

FileVault is a security feature of Mac OS X 10.3 or later. It encrypts your home directory and saves it as a disk image file. For more information about FileVault, choose Mac Help from the Help menu in the Finder and search on "FileVault".

You can turn on FileVault in Security preferences or Accounts preferences.

When you turn on FileVault, your home directory, including your Public folder and Drop Box, is unavailable if you've logged out. To make it available, log into your account.

If you connect to the computer via file sharing (or any sharing service), you won't see your shared (Public) folder or Drop Box. To see it in Mac OS X 10.3 through 10.3.9, log in at the computer where your account is. In Mac OS X 10.4 or later, you won't see your shared (Public) folder or Drop Box after you log in at the computer where you account is.

This document will be updated as more information becomes available.

Mac OS X 10.2: "You Have Inserted a Disk Containing..." Alert at Login

Learn about a message that may appear when a user with limited access logs in.
This article has been archived and is no longer updated by Apple.
When logging in as a limited user, the following message appears if "Remove items from Dock" is not enabled for the account:

> "You have inserted a disk containing volumes that Mac OS X can read. To continue with the disk inserted, click Ignore"

This happens when more than one volume is present and the user has limited security options, as configured in Accounts preferences by an administrator user.

You can dismiss this alert by clicking Ignore, as the message states. It is not a cause for concern, but may appear each time the user logs in.

Published Date: Feb 18, 2012

Mac OS X 10.2.7: System Folder Dimmed in Classic Preferences, "No System Folder" Alert

Quit and open System Preferences if your Mac OS 9 System Folder is dimmed in Classic preferences or if a "no System Folder" alert appears..

This article has been archived and is no longer updated by Apple.

Symptom

- The Mac OS 9 System Folder is dimmed in Classic preferences.
- This alert appears when starting Classic: "Classic Startup found no System Folder on the boot volume from which to start Classic."

This can happen when the user account has limited access.

Solution

Update to Mac OS X 10.2.8 or later.

As a workaround, follow these steps:

1. If System Preferences is open, quit it.
2. From the **Apple** menu, choose **System Preferences**.
3. From the **View** menu, choose **Classic**.
4. Select the desired System Folder, then quit System Preferences.

Published Date: Feb 18, 2012

Mac OS X 10.3 Tip: Use Keyboard Viewer for Key Caps functions

Learn about Keyboard Viewer, which replaces the Key Caps utility used in earlier Mac OS X versions.
This article has been archived and is no longer updated by Apple.
Mac OS X Panther includes Keyboard Viewer, which is equivalent to Key Caps.

To use Keyboard Viewer, first enable it in International preferences:

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **International**.
3. Click Input Menu.
4. Enable the Keyboard Viewer palette.
5. Enable "Show input menu in menu bar".

International preferences

After Keyboard Viewer is enabled, you can use it by choosing Keyboard Viewer from the menu that looks like a flag. It's in the upper right corner of your screen.

Published Date: Oct 11, 2016

Mac OS X 10.3, 10.4: Some applications only work in one account at a time

This article has been archived and is no longer updated by Apple.

Some applications are designed to work with one user account at a time. If such an application is already open for one user, and you switch to a different account (for example, with Fast User Switching) you can't open the same application again.

When you try to open an application that is already open in a first user account, nothing happens if you click the application's icon in the Dock. If you open the application by double-clicking its icon in the Finder, a message containing "error -1026" may appear.

As a workaround, quit the application in the first account before opening it in a second account.

Contact the application's publisher for more information or further assistance. Because some applications are designed to be used by one account at a time, this may be considered normal behavior by the application's publisher.

Examples of Apple applications that you can't open by more than one user account at a time

- Final Cut Pro
- Final Cut Express
- DVD Studio Pro
- LiveType
- Cinema Tools
- Compressor
- Shake
- Soundtrack (Mac OS X 10.3 only)
- Logic Audio
- iDVD
- iTunes (Mac OS X 10.3 only)
- Backup 2.0 or earlier (.Mac)

Examples of Apple applications that you can open within multiple accounts

- iTunes (Mac OS X 10.4 or later)
- Soundtrack (Mac OS X 10.4 or later)
- iPhoto
- iMovie
  Note: iMovie can't control an attached camera if the camera is already in use by iMovie or another application in a different user account.
- iSync
- iCal
- Keynote
- AppleWorks
- Safari
- iChat

  Note: iChat logs out the currently signed-in ID before switching to the other user because you can't have two different iChat accounts signed in at the same time from the same computer.

Mac OS X 10.3 Mail: Long Internet URLs in a message may not work

With Mac OS X 10.3 through 10.3.3, long address (URL) in a Mac OS X Panther Mail message may not open in your web browser when you click it.
This article has been archived and is no longer updated by Apple.
In some cases, a long URL contained in a Mail message that wraps across more than one line may not work when you click it. Your web browser may say the page cannot be found or display a "404" alert.

Update to Mac OS X 10.3.4 or later to fix this.

Workarounds

Use either of the following workarounds if you're not ready to update:

- Copy the entire URL from the Mail message and paste it into your browser's address field. Do not copy any enclosing characters because your browser may not work with them. For example, don't copy the "<" or ">" if they appear.
- Remove "%0A" from the URL in your browser**.** For example, there is a line break in this URL after "Reference". In your web browser, the line break appears as "%0A":

URL in an email message that has a line break

URL in Safari with the line break "%0A" highlighted

To fix this, manually delete "%0A" from the web browser's address field, then press Return to open the page again.

Published Date: Oct 11, 2016

Mac OS X 10.3: Cannot Deselect Kotoeri Input in International Preferences

If there are third-party input methods installed, Kotoeri-related items may still appear in the input menu even if you deselect Kotoeri in International preferences.
This article has been archived and is no longer updated by Apple.
This issue can occur after each restart. To avoid this, follow these steps one time:

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **International**.
3. Select any third-party Japanese input methods, such as ATOK, from the list of keyboard layouts, input methods, and palettes.
4. Close International preferences.
5. From the **Input** menu (generally looks like a flag in the menu bar), choose the third-party input methods.
6. From the Input menu, choose **Open International**.
7. Deselect Kotoeri in the list of keyboard layouts, input methods, and palettes

Published Date: Oct 11, 2016

Mac OS X 10.3: "/spool/cups/" alert when printing or faxing

Update to Mac OS X 10.3.1 or later if you can't print or fax, or if received faxes forwarded by email are never received by the recipients.
This article has been archived and is no longer updated by Apple.
You can't print or fax with Mac OS X 10.3. When you try, this alert appears: " Can't open '/private/var/spool/cups/d00158-001'".

Note: The name and number of the cups spool file may be different than the one above.

- Received faxes you send by email to the address in Print & Fax preferences are never received, and no alert appears.

If you use sendmail (a mail function in the Darwin subsystem unrelated to the application Mail), this alert may appear:

"sendmail: fatal: file /etc/postfix/main.cf: parameter mail_owner: unknown user name value: postfix"

This can happen after:

- You've upgraded Mac OS X 10.2 through 10.2.8 to Mac OS X 10.3.
- You've used Disk Utilities Repair Permissions after upgrading.
- You receive a fax.

Download and install Mac OS X 10.3.1 or later to avoid these issues.
Published Date: Oct 11, 2016

Mac OS X 10.3, iDisk: Local iDisk Sync Issues, Some Folders May Appear Empty

Update to Mac OS X 10.3.1 or later if your Mac OS X Panther computer hasn't been restarted in three or more days and some iDisk folders appear empty, or if you have issues syncing your iDisk.

This article has been archived and is no longer updated by Apple.
Every 72 hours after you start up or restart your computer, a routine maintenance task (or "cron job") runs that can affect iDisk. If you have selected the "Create a local copy of your iDisk" option in .Mac preferences and cannot sync after your computer has been on for three or more days, download and install the Mac OS X 10.3.1 Update or later.

Similarly, if the Backup, Library, or Software folders of your iDisk appear to be empty, download and install the Mac OS X 10.3.1 Update or later.

Note: The task should run at about 3:15 a.m unless the computer is in sleep. You might be able to avoid this issue by making sure the computer is in sleep at this time, however this will prevent other background maintenance tasks from running, which are described in technical document 107388 "**Mac OS X: How to Force Background Maintenance Tasks (Logs and Temporary Items)**".

Mac OS X 10.3: Upgrade Installation Stops at Disc 2, "iTunes.bom" Message in Log

A Mac OS X Panther upgrade installation may stop on disc (CD) 2. Learn how to fix this and get Mac OS X Panther installed.
This article has been archived and is no longer updated by Apple.

Symptom

This alert message appears when upgrading to Mac OS X 10.3 from an earlier version: "There were errors installing the software."

The installation log includes this message:

> "Can't open package /Mac OS X/Library/Receipts/iTunes.pkg (there was an error reading the file iTunes.bom)."

This can happen when performing an upgrade installation on a volume where an early version of iTunes (version 1.0) was formerly installed.

Solution

1. Click Cancel to stop the installation.
2. The Mac OS X Panther setup assistant opens automatically for you. Enter your registration information.
3. After registration is complete, you'll be in the Finder. From the **Go** menu, choose **Go to Folder**.
4. Type: `/Library/Receipts`
5. Click Go.
6. The Receipts window opens. Drag the iTunes.pkg file to the Trash.
7. Double-click the Mac OS X Install Disc 2 icon.
8. Double-click this file: "InstallCD2.mpkg".
9. Complete the installation.

Note: Some items you had previously selected to install may require disc 3. You may need to manually install these items from installer package files, whose file names end with ".pkg," on disc 3. For example, some third-party raster (inkjet) printer drivers are located on disc 3, as described in technical document 25588, "**Mac OS X 10.3: Raster (Inkjet) Printer Drivers Included**".
Published Date: Oct 11, 2016

Apple security updates (August, 2003 and earlier)

This document outlines security updates for Apple products. **Note:** For the protection of its customers, Apple does not disclose, discuss or confirm security issues until a full investigation has occurred and any necessary patches or releases are available.

Important: This document describes updates and releases from August 2003 (2003-08) **and earlier**, such as Mac OS X 10.1, 10.2, 10.2.6 and Security Update 2003-08-14. For information about newer security updates, see one of these documents:

- Apple security updates (25-Jan-2005 and later)
- Apple security updates (03-Oct-2003 to 11-Jan-2005)

This article has been archived and is no longer updated by Apple.
This document outlines security updates for Apple products. **Note:** For the protection of its customers, Apple does not disclose, discuss or confirm security issues until a full investigation has occurred and any necessary patches or releases are available.

Important: This document describes updates and releases from August 2003 (2003-08) **and earlier**, such as Mac OS X 10.1, 10.2, 10.2.6 and Security Update 2003-08-14. For information about newer security updates, see one of these documents:

- Apple security updates (25-Jan-2005 and later)
- Apple security updates (03-Oct-2003 to 11-Jan-2005)

Obtaining Mac OS X

Information about obtaining Mac OS X can be found on the Mac OS X website (http://www.apple.com/macosx/).

Information about obtaining Mac OS X Server can be found on the Mac OS X Server website (http://www.apple.com/macosx/server/).

Information about the Apple Product Security PGP Key is available in technical document 25314, "How To Use The Apple Product Security PGP Key".

Software updates are available via:

- The Software Update preference
- Apple Downloads (http://www.apple.com/swupdates/)

Security updates: 2003-08 and earlier

Security updates are listed below according to the software release in which they first appeared. Where possible, CVE IDs (http://cve.mitre.org/cve/) are used to reference the vulnerabilities for further information.

For information about newer security updates, see technical document 61798, "Apple Security Updates".

Security Update 2003-08-14

- **fb_realpath(): Addresses CAN-2003-0466**, a potential vulnerability in the fb_realpath() function, specifically in the FTPServer and Libc projects, which could allow a local or remote user to gain unauthorized root privileges to a system.

Security Update 2003-07-23

- **Fixes CAN-2003-0601** to improve the security of your system by assigning a "disabled" password to a new account created by Workgroup Manager until that account has been saved for the first time. This ensures the new account cannot be accessed by an unauthorized individual.

Security Update 2003-07-14

- **Screen Effects Password: Fixes CAN-2003-0518**, a potential vulnerability when a password is required upon waking from the Screen Effects feature, which could allow an unauthorized user access to the desktop of the logged in user. Credit to Denis Ahrens for reporting this issue.

Security Update 2003-06-12 (Mac OS X Server only)

- **Apache 2.0: Fixes CAN-2003-0245** by updating Apache 2.0.45 to 2.0.46 to address a security hole in the mod_dav module that could be exploited remotely causing an Apache Web server process to crash. Apache 1.3 is unaffected and is the primary web server on Mac OS X Server. Apache 2.0 is installed with Mac OS X Server, but off by default.
- **dsimportexport: Fixes CAN-2003-0420** in which a logged-in user could potentially view the name and password of the account running the dsimportexport tool

Security Update 2003-06-09 (version 2.0)

- **AFP: Fixes CAN-2003-0379.** When Apple File Service (AFP Server) in Mac OS X Server is serving files on a UFS or re-shared NFS volume, there is a potential vulnerability that can allow a remote user to overwrite arbitrary files.
- **Directory Services: Fixes CAN-2003-0378.** When logging in via Kerberos on an LDAPv3 server, the account password may be sent in cleartext format when Login Window falls back to trying a simple bind on the server.

Safari 1.0 Beta 2 (v74)

- **Fixes CAN-2003-0355** in which Safari does not validate the Common Name field on X.509 certificates. Details are available from (http://www.securityfocus.com/archive/1/320707).
- The latest Safari version is available from (http://www.apple.com/safari/).

Mac OS X 10.2.6

- **IPSec: Fixes CAN-2003-0242**, where incoming security policies that match by port would fail to match the correct traffic.

Mac OS X 10.2.5

- **Apache 2.0: Fixes CAN-2003-0132**, a denial of service vulnerability in Apache 2.0 versions through 2.0.44. Apache 2.0 is distributed only with Mac OS X Server, and is not enabled by default.
- **Directory Services: Fixes CAN-2003-0171** DirectoryServices Privilege Escalation and DoS Attack. DirectoryServices is part of the Mac OS X and Mac OS X Server information services subsystem. It is launched at startup, setuid root and installed by default. It is possible for a local attacker to modify an environment variable that would allow the execution of arbitrary commands as root. Credit to Dave G. from @stake, Inc. for the discovery of this vulnerability.
- **File Sharing/Service: Fixes CAN-2003-0198** where the contents of the write-only DropBox folder can be revealed. When enabled, Personal File Sharing on Mac OS X or Apple File Service on Mac OS X Server, a "DropBox" folder is available by default to allow people to deposit files. This update no longer allows the permissions of the "DropBox" folder to be changed by a guest.
- **OpenSSL: Fixes CAN-2003-0131** Klima-Pokorny-Rosa attack on PKCS #1 v1.5 padding. The patch from the OpenSSL team, which addresses this vulnerability, is applied to Mac OS X and Mac OS X Server.
- **Samba: Fixes CAN-2003-0201** which could allow an anonymous user to gain remote root access due to a buffer overflow. The built-in Windows file sharing is based on the open source technology called Samba and is off by default in Mac OS X.
- **sendmail: Fixes CAN-2003-0161** where address parsing code in sendmail does not adequately check the length of email addresses. Only the patch from the sendmail team is applied to the currently-shipping version of sendmail in Mac OS X and Mac OS X Server.

QuickTime 6.1 for Windows

- **Fixes CAN-2003-0168**, a potential vulnerability in QuickTime Player for Windows that could allow a remote attacker to compromise a target system. This exploit is only possible if the attacker can convince a user to load a specially crafted QuickTime URL. Upon successful exploitation, arbitrary code can be executed under the privileges of the QuickTime user.

Security Update 2003-03-24

- **Samba: Fixes CAN-2003-0085 and CAN-2003-0086** which could allow unauthorized remote access to the host system. The built-in Windows file sharing is based on the open source technology called Samba and is off by default in Mac OS X. This update only applies the security fixes to the currently-shipping 2.2.3 version of Samba on Mac OS X 10.2.4, and the Samba version is otherwise unchanged.
- **OpenSSL: Fixes CAN-2003-0147**, to address an issue in which RSA private keys can be compromised when communicating over

LANs, Internet2/Abilene, and interprocess communication on local machine.

Security Update 2003-03-03

- **Sendmail: Fixes CAN-2002-1337** in which a remote attacker could gain elevated privileges on affected hosts. Sendmail is not enabled by default on Mac OS X, so only those systems which have explicitly enabled sendmail are vulnerable. All Mac OS X users, however, are encouraged to apply this update. The sendmail fix is available in Security Update 2003-03-03.
- **OpenSSL: Fixes CAN-2003-0078**, in which it is theoretically possible for a third-party to extract the original plaintext of encrypted messages sent over a network. Security Update 2003-03-03 applies this fix for Mac OS X 10.2.4; customers of earlier Mac OS X versions may obtain the latest openssl version directly from the OpenSSL Web site: http://www.openssl.org/

Mac OS X 10.2.4 (client)

- **Sendmail: Fixes CAN-2002-0906** Buffer overflow in Sendmail before 8.12.5, when configured to use a custom DNS map to query TXT records, could permit a denial of service attack and possibly allow execution of arbitrary code. Mac OS X 10.2.4 contains Sendmail 8.12.6 with the SMRSH fix applied to also address **CAN-2002-1165**.
- **AFP: Fixes CAN-2003-0049** "AFP login permissions for the system administrator". Provides an option whereby a system administrator may or may not be allowed to log in as a user, authenticating via their admin password. Previously, administrators could always log in as a user, authenticating via their own admin password.
- **Classic: Fixes CAN-2003-0088**, where an attacker may change an environment variable to create arbitrary files or overwrite existing files, which could lead to obtaining elevated privileges. Credit to Dave G. from @stake, Inc. for discovering this issue.
- **Samba:** Previous releases of Mac OS X are not vulnerable to **CAN-2002-1318**, an issue in Samba's length checking for encrypted password changes. Mac OS X currently uses Directory Services for authentication, and does not call the vulnerable Samba function. However, to prevent a potential future exploit via this function, the patch from Samba 2.2.7 was applied although the version of Samba was not changed for this update release. Further information is available from: http://samba.org/

Mac OS X 10.2.4 Server

- **QuickTime Streaming Server:** Fixes CAN-2003-0050 QTSS Arbitrary command execution. The QuickTime Streaming Administration Server relies on the parse_xml.cgi application to authenticate and interface with the user. This CGI can pass unvalidated input which could allow a remote attacker to execute arbitrary code on the server and to gain root privileges. Credit to Dave G. from @stake, Inc. for finding this vulnerability.
- **QuickTime Streaming Server:** Fixes CAN-2003-0051 QTSS Physical path revelation. The QuickTime Streaming Administration Server relies on the parse_xml.cgi application to authenticate and interface with the user. This CGI could be used to reveal the physical path upon which the Darwin/Quicktime Administration Servers are installed within. Credit to @stake, Inc. for finding this vulnerability.
- **QuickTime Streaming Server:** Fixes CAN-2003-0052 QTSS Directory listings. The QuickTime Streaming Administration Server relies on the parse_xml.cgi application to authenticate and interface with the user. This CGI could be used to reveal arbitrary directory listings due to the lack of user input validation within the application. Credit to Ollie Whitehouse from @stake, Inc. for finding this vulnerability.
- **QuickTime Streaming Server:** Fixes CAN-2003-0053 QTSS Login credentials. The QuickTime Streaming Administration Server relies on the parse_xml.cgi application to authenticate and interface with the user. A vulnerability in the handling of error messages from this CGI could be used in a cross-site scripting attack to gain valid login credentials. Credit to Ollie Whitehouse from @stake, Inc. for finding this vulnerability.
- **QuickTime Streaming Server:** Fixes CAN-2003-0054 Arbitrary command execution when viewing QTSS logs. If an unauthenticated user of QuickTime Streaming Server makes a request to the streaming port, the request is then written to the log file. It is possible to craft the request such that arbitrary code can be executed when the logs are viewed by the system administrator via a browser. Credit to Ollie Whitehouse from @stake, Inc. for finding this vulnerability.
- **QuickTime Streaming Server:** Fixes CAN-2003-0055 Buffer overflow in MP3 Broadcasting application. There is a buffer overflow in the stand-alone MP3Broadcaster application. An MP3 file which has a filename of over 256 bytes will cause a buffer overflow to occur. This could be used by local/ftp users to obtain elevated privileges. Credit to Ollie Whitehouse from @stake, Inc. for finding this vulnerability.
- **Sendmail:** Fixes CAN-2002-0906 Buffer overflow in Sendmail before 8.12.5, when configured to use a custom DNS map to query TXT records, could permit a denial of service attack and possibly allow execution of arbitrary code. Mac OS X 10.2.4 contains Sendmail 8.12.6 with the SMRSH fix applied to also address CAN-2002-1165 .
- **AFP:** Fixes CAN-2003-0049 "AFP login permissions for the system administrator". Provides an option whereby a system administrator may or may not be allowed to log in as a user, authenticating via their admin password. Previously, administrators could always log in as a user, authenticating via their own admin password.
- **Classic:** Fixes CAN-2003-0088 , where an attacker may change an environment variable to create arbitrary files or overwrite existing files, which could lead to obtaining elevated privileges. Credit to Dave G. from @stake, Inc. for discovering this issue.
- **Samba:** Previous releases of Mac OS X are not vulnerable to CAN-2002-1318 , an issue in Samba's length checking for encrypted password changes. Mac OS X currently uses Directory Services for authentication, and does not call the vulnerable Samba function. However, to prevent a potential future exploit via this function, the patch from Samba 2.2.7 was applied although the version of Samba was not changed for this update release. Further information is available from: http://samba.org/

- **Integrated WebDAV Digest Authentication:** The mod_digest_apple Apache module has been added to more easily enable digest authentication for an existing WebDAV realm. This eliminates the need to maintain a separate digest file containing the list of authorized users, passwords, and realms. mod_digest_apple works in coordination with Open Directory for user authentication. For further details, open the Help Viewer after installing Mac OS X Server version 10.2.4, select Mac OS X Server Help in the drawer, and search for "New: Enabling Integrated WebDAV Digest Authentication."

Mac OS X 10.2.3

- **fetchmail: Fixes CAN-2002-1174** and **CAN-2002-1175** that could lead to a potential denial of service when using the fetchmail command-line tool. fetchmail is updated to version 6.1.2+IMAP-GSS+SSL+INET6
- **CUPS:** Provides fixes for the following potential issues that could be exploited remotely when Printer Sharing is enabled. Printer Sharing is not enabled by default on Mac OS X or Mac OS X Server.
  CAN-2002-1383: Multiple Integer Overflows
  CAN-2002-1366: /etc/cups/certs/ Race Condition
  CAN-2002-1367: Adding Printers with UDP Packets
  CAN-2002-1368: Negative Length Memcpy() Calls
  CAN-2002-1384: Integer Overflows in pdftops Filter and Xpdf
  CAN-2002-1369: Unsafe Strncat Function Call in jobs.c
  CAN-2002-1370: Root Certificate Design Flaw
  CAN-2002-1371: Zero Width Images in filters/image-gif.c
  CAN-2002-1372: File Descriptor Resource Leaks

Security Update 2002-11-21

BIND: Updated to version 8.3.4 to fix potential vulnerabilities in the domain server and client library from Internet Software Consortium (ISC) that comes with Mac OS X and Mac OS X Server. BIND is not turned on by default on Mac OS X or Mac OS X Server.

CVE IDs: CAN-2002-1219, CAN-2002-1220, CAN-2002-1221, CAN-2002-0029

Further information is available at:
http://www.cert.org/advisories/CA-2002-31.html
http://www.kb.cert.org/vuls/id/457875

Mac OS X 10.2.2

This update addresses the following potential security issues:

- **CAN-2002-1266: Local User Privilege Elevation via Disk Image File** It is possible for a local user to obtain elevated privileges on a system by opening a disk image file that was created on another computer with administrator level privileges.
- **CAN-2002-0830: This is FreeBSD-SA-02:36.nfs,** a potential vulnerability in the Network File System (NFS) where a remote attacker could cause a denial of service.
- **IP Firewall:** Under certain circumstances, the ipfw firewall built into Mac OS X may block packets that are explicitly allowed by the firewall rules. This does not meet the formal requirements of a security vulnerability and does not obtain a CVE ID.
- **CAN-2002-1267: CUPS Printing Web Administration is Remotely Accessible** A malicious user could access the port to run the CUPS Printing Web Administration utility. It would then be possible to cause a denial of service to a printer.
- **CAN-2002-1268: User Privilege Elevation via Mounting an ISO 9600 CD** Users could gain elevated privileges when logged into a system that has an ISO 9600 CD available to the file system.
- **CAN-2002-1269: NetInfo Manager Application could allow filesystem access** A security vulnerability in the NetInfo Manager application could allow a malicious user to navigate the file system.
- **CAN-2002-1270: map_fd() Mach system call can allow a file to be read** The map_fd() Mach system call can allow a caller to read a file for which they only have write access.
- **CAN-2002-1265: TCP issue in RPC** The RPC-based libc implementation could fail to properly read data from TCP connections. As a result, a remote attacker could deny service to system daemons. Further information is available in CERT VU#266817 at: http://www.kb.cert.org/vuls/id/266817
- **CAN-2002-0839, CAN-2002-0840, CAN-2002-0843: Apache** Apache is updated to version 1.3.27 to address a number of issues.

Mac OS X Server 10.2.2

- Includes all security fixes noted in Mac OS X 10.2.2, plus **CAN-2002-0661, CAN-2002-0654, CAN-2002-0654: Apache 2** Apache 2 is provided with Mac OS X Server, but not enabled by default. The version is updated to Apache 2.0.42 to address a number of issues.

StuffIt Expander Security Update 2002-10-15

- **Stuffit Expander:** CAN-2002-0370. This update resolves a potential security vulnerability in versions 6.5.2 and earlier of Stuffit Expander. Further information is available at: http://www.kb.cert.org/vuls/id/383779 .

Security Update 2002-09-20

- **Terminal:** This update fixes a potential vulnerability introduced in Terminal version 1.3 (v81) that shipped with Mac OS X 10.2 that could allow an attacker to remotely execute arbitrary commands on the user's system. Terminal is updated to version 1.3.1 (v82) with this Security Update.

Security Update 2002-08-23

- This security update is for Mac OS X 10.2 and applies the fixes contained in Security Update 2002-08-02 which was for Mac OS X 10.1.5.

Security Update 2002-08-20

- **Secure Transport:** This update enhances the certificate verification in OS X and is now in full compliance with the Internet X.509 Public Key Infrastructure Certificate and CRL Profile (RFC2459).

Security Update 2002-08-02

This update addresses the following security vulnerabilities, which affect current shipping versions of Mac OS X Server. These services are turned off by default in Mac OS X client, however if these services are turned on then the client becomes vulnerable. Users of Mac OS X client should also install this update.

- **OpenSSL:** Fixes security vulnerabilities CAN-2002-0656, CAN-2002-0657, CAN-2002-0655, and CAN-2002-0659. Details are available via: http://www.cert.org/advisories/CA-2002-23.html
- **mod_ssl:** Fixes CAN-2002-0653, an off-by-one buffer overflow in mod_ssl Apache module. Details are available via: http://cve.mitre.org/cgi-bin/cvename.cgi?name=CAN-2002-0653
- **Sun RPC:** Fixes CAN-2002-039, a buffer overflow in the Sun RPC XDR decoder. Details are available via: http://bvlive01.iss.net/issEn/delivery/xforce/alertdetail.jsp?oid=20823

Security Update 7-18-02 (2002-07-18)

- **Software Update:** Contains Software Update client 1.4.7 which adds cryptographic signature verification to the softwareupdate command line tool. This provides an additional means to perform software updates in a secure manner, along with the existing Software Update capability contained in System Preferences.

Security Update 7-12-02 (2002-07-12)

- **Software Update:** Fixes CVE ID CAN-2002-0676 to increase the security of the Software Update process for systems with Software Update client 1.4.5 or earlier. Packages presented via the Software Update mechanism are now cryptographically signed, and the new Software Update client 1.4.6 checks for a valid signature before installing new packages.

Security Update July 2002 (2002-07)

- **Apache:** Fixes CVE ID CAN-2002-0392 which allows remote attackers to cause a denial of service and possibly execute arbitrary code. Further details are available from: http://www.cert.org/advisories/CA-2002-17.html
- **OpenSSH:** Fixes two vulnerabilities, CAN-2002-0639 and CAN-2002-0640, where a remote intruder may be able to execute arbitrary code on the local system. Further details are available from: http://www.cert.org/advisories/CA-2002-18.html

Mac OS X 10.1.5

- **sudo** - Fixes CAN-2002-0184, where a heap overflow in sudo may allow local users to gain root privileges via special characters in the -p (prompt) argument.
- **sendmail** - Fixes CVE-2001-0653, where an input validation error exists in Sendmail's debugging functionality which could lead to a system compromise.

Internet Explorer 5.1 Security Update (2002-04)

- This addresses a vulnerability that could allow an attacker to take over your computer. Microsoft has since discontinued support and development on Internet Explorer for Mac, please consider upgrading to Safari instead.

Mac OS X 10.1.4

- **TCP/IP broadcast:** Addresses CAN-2002-0381 such that TCP/IP connections now check and block broadcast or multicast IP destination addresses. Further details at: http://www.FreeBSD.org/cgi/query-pr.cgi?pr=35022

Security Update - April 2002 (2002-04)

- **Apache** - updated to version 1.3.23 in order to incorporate the mod_ssl security fix.
- **Apache Mod_SSL** - updated to version 2.8.7-1.3.23 to address the buffer overflow vulnerability CAN-2002-0082 which could potentially be used to run arbitrary code. Further Details at: http://archives.neohapsis.com/archives/bugtraq/2002-02/0313.html
- **groff** - updated to version 1.17.2 to address the vulnerability CAN-2002-0003, where an attacker could gain rights as the 'lp' user remotely. Further details at: http://online.securityfocus.com/advisories/3859
- **mail_cmds** - updated to fix a vulnerability where users could be added to the mail group
- **OpenSSH** -- updated to version 3.1p1 to address the vulnerability CAN-2002-0083, where an attacker could influence the contents of the memory. Further details at: http://www.pine.nl/advisories/pine-cert-20020301.html
- **PHP** - updated to version 4.1.2 to address the vulnerability CAN-2002-0081, which could allow an intruder to execute arbitrary code with the privileges of the web server. Further details at: http://www.cert.org/advisories/CA-2002-05.html
- **rsync** - updated to version 2.5.2 to address the vulnerability CAN-2002-0048 which could lead to corruption of the stack and possibly to execution of arbitrary code as the root user. Further details at: ftp://ftp.FreeBSD.org/pub/FreeBSD/CERT/advisories/FreeBSD-SA-02:10.rsync.asc
- **sudo** - updated to version 1.6.5p2 to address the vulnerability CAN-2002-0043, where a local user may obtain superuser privileges. Further details at: ftp://ftp.FreeBSD.org/pub/FreeBSD/CERT/advisories/FreeBSD-SA-02:06.sudo.asc

Mac OS X 10.1.3

- **openssh** - Updated to version 3.0.2p1 to address several vulnerabilities in the previous version. For details, please refer to: http://www.openssh.com/security.html
- **WebDAV** - Extended the Digest Authentication mode to work with additional servers

Mac OS X 10.1 Security Update 10-19-01 (2001-10-19)

- Fixes the vulnerability described in http://www.stepwise.com/Articles/Admin/2001-10-15.01.html where an application can be granted root access privileges.

Internet Explorer 5.1.1

- **IE 5.1.1** - Fixes a problem with IE 5.1 bundled with Mac OS X v10.1 where Internet Explorer executes downloaded software automatically, which could result in data loss or other harm. More information is available in technical document 106503, "**Mac OS X 10.1: Internet Explorer Executes Downloaded Software Automatically**".

Mac OS X 10.1

- **crontab** - Fixes the vulnerability described in FreeBSD-SA-01:09 (ftp://ftp.FreeBSD.org/pub/FreeBSD/CERT/advisories/FreeBSD-SA-01:09.crontab.v1.1.asc) where local users can read arbitrary local files that conform to a valid crontab file syntax.
- **fetchmail**
  - Fixes the buffer overflow vulnerability described in FreeBSD-SA-01:43 (ftp://ftp.FreeBSD.org/pub/FreeBSD/CERT/advisories/FreeBSD-SA-01:43.fetchmail.asc)
  - Fixes the large header problem described in BugTraq MDKSA-2001:063: fetchmail (http://www.securityfocus.com/advisories/3426)
  - Fixes the memory overwrite vulnerability described in BugTraq ESA-20010816-01: fetchmail-ssl (http://www.securityfocus.com/advisories/3502)
- **ipfw** - Fixes the vulnerability described in FreeBSD-SA-01:08.ipfw (ftp://ftp.FreeBSD.org/pub/FreeBSD/CERT/advisories/FreeBSD-SA-01:08.ipfw.asc) where a remote attack may be constructed with TCP packets with the ECE flag set.
- **java** - Fixes the vulnerability described in:http://sunsolve.Sun.COM/pub-cgi/retrieve.pl?doctype=coll&doc=secbull/216&type=0&nav=sec.sbl&ttl=sec.sbl where an untrusted applet may monitor requests to and responses from an HTTP proxy server.
- **open()** syscall - Fixes the vulnerability described in FreeBSD-SA-97:05.open (ftp://ftp.FreeBSD.org/pub/FreeBSD/CERT/advisories/old/FreeBSD-SA-97:05.open.asc) where another user on the system could do

unauthorized I/O instructions

- **OpenSSL** - Included version 0.9.6b which contains a number of fixes from the previous version. See http://www.openssl.org/ for details.
- **procmail** - Fixed the vulnerability described in Red Hat RHSA-2001:093-03 (http://www.redhat.com/support/errata/RHSA-2001-093.html) where signals are not handled correctly.
- **rwhod** - Fixes the vulnerability described in FreeBSD-SA-01:29.rwhod (ftp://ftp.FreeBSD.org/pub/FreeBSD/CERT/advisories/FreeBSD-SA-01:29.rwhod.asc) where remote users can cause the rwhod daemon to crash, denying service to clients.
- **setlocale()** string overflow - Fixes the vulnerability described in FreeBSD-SA-97:01.setlocale (ftp://ftp.FreeBSD.org/pub/FreeBSD/CERT/advisories/old/FreeBSD-SA-97:01.setlocale) where the setlocale() call contains a number of potential exploits through string overflows during environment variable expansion
- **sort** - Fixes the vulnerability described in CERT Vulnerability Note VU#417216 (http://www.kb.cert.org/vuls/id/417216) where an intruder may be able to block the operation of system administration programs by crashing the sort utility.
- **system clipboard / J2SE** - Fixes a security issue that permitted unauthorized applets access to the system clipboard.
- **tcpdump** - Fixes the vulnerability described in FreeBSD-SA-01:48 (ftp://ftp.FreeBSD.org/pub/FreeBSD/CERT/advisories/FreeBSD-SA-01:48.tcpdump.asc) where remote users can cause the local tcpdump process to crash, and may be able to cause arbitrary code to be executed.
- **TCP Initial Sequence Numbers** - Fixes the potential vulnerability described in FreeBSD-SA-00:52 (ftp://ftp.FreeBSD.org/pub/FreeBSD/CERT/advisories/FreeBSD-SA-00:52.tcp-iss.asc) where the algorithm to generate the number the system will use for the next incoming TCP connection was not sufficiently random
- **tcsh '>>' operator** - Fixes the vulnerability described in FreeBSD-SA-00:76 (ftp://ftp.FreeBSD.org/pub/FreeBSD/CERT/advisories/FreeBSD-SA-00:76.tcsh-csh.asc) where unprivileged local users can cause an arbitrary file to be overwritten when another person invokes the '<<' operator in tcsh (e.g. from within a shell script)
- **telnetd** - Fixes the vulnerability described in FreeBSD-SA-01:49 (ftp://ftp.FreeBSD.org/pub/FreeBSD/CERT/advisories/FreeBSD-SA-01:49.telnetd.v1.1.asc) where remote users can cause arbitrary code to be executed as the user running telnetd.
- **timed** - Fixes the vulnerability described in FreeBSD-SA-01:28 (ftp://ftp.FreeBSD.org/pub/FreeBSD/CERT/advisories/FreeBSD-SA-01:28.timed.asc) where remote users can cause the timed daemon to crash, denying service to clients.

Mac OS X Server 10.1

- **MySQL 3.23.42** - Contains a number of fixes from the previous version. See the 3.23.42 section on the MySQL site (http://www.mysql.com/downloads/mysql-3.23.html) for details.
- **Tomcat 3.2.3** - Contains a number of fixes from the previous version. See the Tomcat site (http://jakarta.apache.org/tomcat/) for details.
- **Apache** - Fixed the .DS_Store file vulnerability described in http://securityfocus.com/bid/3324
- **Apache** - Fixed the potential vulnerability where .htaccess files might be visible to web browsers if created on HFS+ volumes. The files directive in the http.conf file was modified to block from visibility to web browsers all files whose names begin with .ht, regardless of case.

Mac OS X Web Sharing Update 1.0

- **Apache 1.3.19** - Fixes security issues with sites use of the mass virtual hosting module mod_vhost_alias or mod_rewrite.
- **mod_hfs_apple** - Addresses Apache case-insensitivity problems on Mac OS Extended (HFS+) volumes.
- **OpenSSH 2.9p2** - Fixes SSH1 vulnerability described in http://www.openwall.com/advisories/OW-003-ssh-traffic-analysis.txt.
- **sudo** - Fixes the buffer overflow vulnerability described in FreeBSD-SA-01:38 (ftp://ftp.FreeBSD.org/pub/FreeBSD/CERT/advisories/FreeBSD-SA-01:38.sudo.asc)

Mac OS X 10.0.4 Server Update

- **Samba 2.0.9** - Addresses the macro vulnerability described in us1.samba.org/samba/whatsnew/macroexploit.html
- **sudo** - Fixes the buffer overflow vulnerability described in FreeBSD-SA-01:38 (ftp://ftp.FreeBSD.org/pub/FreeBSD/CERT/advisories/FreeBSD-SA-01:38.sudo.asc)

Mac OS X 10.0.2

- **FTP** - Fixes the File Globbing vulnerability described in CERT(R) Advisory CA-2001-07 (http://www.cert.org/advisories/CA-2001-07.html)
- **NTP** - Fixes the buffer overflow vulnerability described in FreeBSD-SA-01:31 (ftp://ftp.FreeBSD.org/pub/FreeBSD/CERT/advisories/FreeBSD-SA-01:31.ntpd.asc)

Mac OS X 10.0.1

- **OpenSSH-2.3.0p1 -** SSH services are enabled via the Sharing pane in System Preferences

Mac OS Runtime for Java (MRJ) 2.2.5

- **MRJ 2.2.5** - Fixes a security issue that permitted unauthorized applets access to the system clipboard.

Mac OS X 10.3, 10.3.1: HP LaserJet "Printer not responding" Message

Troubleshoot an HP LaserJet printer connection if the message "Printer not responding" appears. This document applies to Mac OS X 10.3 and 10.3.1.
This article has been archived and is no longer updated by Apple.
When you try to add an HP LaserJet 2300 in Printer Setup Utility, the message "Printer not responding" appears. If you select and add the printer manually, the same message appears when you try to print.

This can happen with an HP LaserJet 2300, 2300L, or 2300d connected via USB, or any HP LaserJet with an HP JetDirect J4135A Connectivity Card installed when connected via USB.

To fix this, download and install Mac OS X 10.3.2 Update or later. It's available from Software Update preferences, or Apple Downloads (http://www.apple.com/swupdates/).

If you're not ready to update, you can use these workarounds:

- If the printer has an HP JetDirect Card for 10/100Base-T installed, connect the printer to the computer's Ethernet port.
- Connect the printer to the USB port of an AirPort Extreme Base Station, if one is available. For more information, see technical document **107456**.

Mac OS X 10.3: Chart of available Mac OS software updates

This article has been archived and is no longer updated by Apple.

Learn about Mac OS updates available for Mac OS X 10.3 Panther.

Mac OS X 10.3 Software Updates

Update name and download link	Prerequisite software	Release date	Detailed information	Tips
Mac OS X 10.3.9 Update	Mac OS X 10.3, 10.3.1, 10.3.2, 10.3.3, 10.3.4, 10.3.5, 10.3.6, 10.3.7, 10.3.8	15 Apr 2005	About this update	2
QuickTime 7.0.4	Mac OS X 10.3.9 or later	10 Jan 2006	About this update	n/a
Java Update 1.4.2 Update 2	Mac OS X 10.3.4 or later	23 Sept 2004	About this update	1

Security Updates

For information about security updates available for Mac OS X, see Apple security updates.

Upgrading to Mac OS X 10.3

If you have a version of Mac OS X earlier than Mac OS X 10.3 Panther, see "Mac OS X: How to Upgrade to Version 10.3".

Tips

1. Security Updates do not change the Mac OS X 10.3 build version. For more information about build versions, see "Mac OS X: About This Mac 'Build' Information".
2. This update includes enhancements delivered with these Mac OS X Updates: 10.3.8, 10.3.7, 10.3.6, 10.3.5, 10.3.4, 10.3.3, 10.3.2, and 10.3.1.
3. To determine if a certain Security Update is installed, look for its package (.pkg) file in the Receipts folder, which is in the Library folder.

Mac OS X 10.3: Media Eject and Volume keys don‘t work

The Media Eject and volume keys may not work if an early version of USB Overdrive is installed.
This article has been archived and is no longer updated by Apple.
Early versions of USB Overdrive, published by Alessandro Levi Montalcini, may prevent the Media Eject, Volume Up, and Volume Down keys from working in Mac OS X Panther.

If you have this issue, update to a later version of USB Overdrive (http://www.usboverdrive.com/).

Also, download and install Mac OS X 10.3.3 Update or later to avoid this issue.

Tip: To see if USB Overdrive is installed on your computer:

1. From the **Apple** menu, choose **System Preferences**.
2. Look for a "USB Overdrive" icon.

If you see the icon, the software is installed.

If you don't use this icon, troubleshoot for other conditions. See "Mac OS X Troubleshooting: How to Isolate an Issue".

Mac OS X 10.3.1: Avoids Losing Settings When FileVault Reclaims Disk Space

To avoid losing preference settings when Mac OS X Panther's FileVault feature reclaims disk space, update to Mac OS X 10.3.1 or later.
This article has been archived and is no longer updated by Apple.
FileVault normally asks to reclaim space before the computer sleeps, restarts, or shuts down. In some cases, you can lose some preference settings after space is reclaimed. Download and install Mac OS X 10.3.1 or later to avoid this issue. It is available in Software Update preferences, or from the **Apple Featured Software** webpage.

FileVault can be turned on or off in the Security or Accounts preferences. Turning off FileVault and/or installing Mac OS X 10.3.1 does not automatically recover lost settings. You should configure any incorrect preference settings after installing the update.

Important: If you force the computer to restart while disk space is being reclaimed, data loss can occur. The same is true if power is lost during the process. Mac OS X 10.3.1 does not address this type of data loss.
Published Date: Oct 11, 2016

Mac OS X 10.2, iBook: Modem Dials, but Is Silent

Your iBook's modem dials and connects just fine, but no sounds are heard when it makes the connection.
This article has been archived and is no longer updated by Apple.
This can occur even if modem sounds are enabled. It is expected behavior with Mac OS X 10.2.3 through 10.2.8 and iBook computers with blueberry, tangerine, or graphite plastics.
Published Date: Feb 18, 2012

Mac OS X 10.3: World Book 2003 unexpectedly quits when opening

If Software MacKiev World Book 2003 Edition won't open with Mac OS X Panther, install an update that's available from the publisher.
This article has been archived and is no longer updated by Apple.
If you use Mac OS X 10.3, install the World Book 7.1.2 Update or later, which is available from Software MacKiev (http://www.mackiev.com/support.html).

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Published Date: Feb 17, 2012

Mac OS X 10.3: Security Update 2003-11-04 Doesn‘t Install

You may not be able to install Security Update 2003-11-04 if an application other than Terminal is installed whose filename contains "Terminal".
This article has been archived and is no longer updated by Apple.

Symptom

- You can't install Security Update 2003-11-04.
- Software Update stops installing during the "Expanding and verifying" or "Now checking local disks" stages.
- A "bus error" message may appear if installing via Terminal.

This can happen when:

- An application besides Terminal is installed whose name contains "Terminal".
- You are installing via Software Update, a downloaded installer, or Terminal.

Solution

1. Click the Finder icon in the Dock.
2. From the **File** menu, choose **Find**. The Find window appears.
3. From the "**Search in**" pop-up menu, choose "**Local disks**".
4. Choose the items in the first and second rows of pop-up menus as illustrated in Figure 1.

Figure 1 Find window

5. Type "Terminal" in the empty text box.
6. Click Search.
7. Rename any applications that are found, except for the application named Terminal, so that the word "Terminal" is not part of their filenames.

   For example, if you find an application named "MyTerminal," rename it to something like "MyTerm" by clicking its filename to select it,

typing a new filename, and pressing Return.

Note: Do not rename preference files or other files whose filenames contain "Terminal" and whose Kind is not application.

8. Download and install Security Update 2003-11-04 again. It is available from Software Update preferences or from Apple Featured Software.

This document will be updated as more information becomes available.

Mac OS X 10.3: Character Palette Unexpectedly Appears

Mac OS X Panther's Character Palette may unexpectedly appear when you log in or after the computer wakes from sleep.
This article has been archived and is no longer updated by Apple.
To avoid this, download and install Mac OS X 10.3.2 Update, or later.

Published Date: Oct 11, 2016

Mac OS X 10.3: DVD Player video shows through overlaying text, or text "sparkles"

This article has been archived and is no longer updated by Apple.

When overlaying text is green in DVD Player, you may see video through the text, or the text may appear to "sparkle".

Note: This document applies to Mac OS X 10.3 through 10.3.9.

Symptom

Overlaying text in DVD Player, such as Closed Captioning and chapter information, sparkles or reveals the video behind it.

This can happen when the overlaying text is green and the computer's graphics card does not support Quartz Extreme. For information about which graphics cards work with Quartz Extreme, read this document.

Solution

1. From the **DVD Player** menu, choose **Preferences**.
2. Click Windows.
3. In the Floating Overlays section, change the text to a different color, such as yellow.

Published Date: Oct 11, 2016

Mac OS X: Items in Mac OS 9 Shutdown Items folder may prevent shut down, restart, or logout

This article has been archived and is no longer updated by Apple.

Items in your Mac OS 9 Shutdown Items folder can prevent Mac OS X from shutting down, restarting, or logging out.

If you can't log out, restart, or shut down your computer when Classic is running, stop Classic.

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **Classic**.
3. Click "Start/Stop".
4. Click the Stop button.
5. Log out, restart or shut down your computer.

To prevent this issue from happening again, do one of the following depending on the settings you've selected in the Advanced section of Classic preferences. If you don't know what your settings are, click Advanced in Classic preferences.

If you use the advanced preference option "Use Mac OS 9 preferences from your home"

Make sure there's nothing in the Shutdown Items folder.

1. Click the Finder icon in the Dock.
2. From the **Go** menu, choose **Go to Folder**. A sheet appears.
3. Type: ~/Library/Classic/
4. Click Go.
5. If you see a message that the folder can't be found, skip to the next section. Otherwise, open the Shutdown Items folder and drag any items in it to the desktop or Trash. If the folder appears to be empty, there may be an invisible item in it. In this case, drag the Shutdown Items folder to the Trash.

If you don't use the advanced preference option "Use Mac OS 9 preferences from your home"

Make sure there's nothing in the Shutdown Items folder, which is in the System Folder used by the Classic environment. If the folder appears to be empty, there may be an invisible item in it. In this case, drag the Shutdown Items folder to the Trash.

Note: If you see a message that says you don't have permission to do this, log in with an administrator account, or ask a person with an administrator account to do this for you.

If you still can't restart or shut down the computer, see technical document 107199, "**Mac OS X: If Your Computer Stops Responding, 'Hangs', or 'Freezes'**".

Published Date: Oct 11, 2016

Mac OS X 10.2, 10.3: How to eject removable media with simple Finder

Learn how to eject removable media, such as a CD or iPod, when Simple Finder is enabled.
This article has been archived and is no longer updated by Apple.
You can eject removable media from your computer, including: CDs, an iPod, Zip disks, FireWire drives, USB drives, and external floppy disks.

These steps apply to Mac OS X 10.2, Mac OS X Server 10.2, Mac OS X 10.3, and Mac OS X Server 10.3.

Removable media in the computer's optical drive

To eject a disc from the computer's optical drive, press the Media Eject key.

Figure 1 Media Eject key

You can also press the F12 key on keyboards that don't have a Media Eject key.

Removable media in a different drive, including external third-party drives

If the media's window appears in Simple Finder, drag the disk icon from the top of its window to the Trash.

Figure 2 Dragging the disk icon to the Trash

You can also eject media by restarting the computer. Immediately after you hear the system startup sound, press and hold the mouse button. Continue to hold the mouse button until the computer is finished starting up. The disk should eject as the computer starts up.

If you have an external USB or FireWire device, you can safely disconnect it right after you hear the system startup sound.

Eject using Sidebar in Mac OS X 10.3

In Mac OS X Panther, you can also use the Sidebar to eject an item:

1. Open any application. TextEdit is a good choice.
2. From the **File** menu, choose **Open**.
3. An eject icon appears next to each disk or item you can eject. Click the eject icon to eject it.

   Figure 3 Eject icon next to a disk

4. Click Cancel, then quit the application.

Mac OS X 10.3: Using an HP Photosmart Printer

Install driver version 2.3.6 or later to use an HP Photosmart printer with Mac OS X Panther.
This article has been archived and is no longer updated by Apple.
HP Photosmart printer driver version 2.3.5 does not work with Mac OS X 10.3. When you try to print, the job may stop, or the application you're printing from may unexpectedly quit. To fix this, install version 2.3.6 or later. You can download a later version from the HP website (http://www.hp.com/).

Tip: Follow these steps to see which driver version is installed:

1. Click the Finder icon in the Dock.
2. From the **Go** menu, choose **Utilities**.
3. Double-click Printer Setup Utility.
4. Select the Photosmart printer in the Printer List.
5. From the **Printers** menu, choose **Show Info**.

Mac OS X: Printing to an HP printer with binary PostScript

This article has been archived and is no longer updated by Apple.

Change a print option if your file prints as garbled text on an HP (http://www.hp.com/) PostScript printer. This article applies to Mac OS X 10.2 or later.

When you send a job to an HP PostScript printer, instead of printing your document, the printer prints multiple pages that have a single line of text and symbols, or fails to print at all. This can happen in applications such as Adobe Photoshop CS3 that create their own PostScript information for the printer.

Affected printers do not accept binary-format PostScript data in their default print queue. This can happen no matter which PPD you chose when you set up the printer. Use any of these solutions:

Print to an AppleTalk queue

If your printer is on an AppleTalk network, follow these steps:

1. Open Print Center (Mac OS X 10.2) or Printer Setup Utility (Mac OS X 10.3).
2. Click the Add button.
3. Choose **AppleTalk** from the top pop-up menu.

   Tip: You do not need to first enable AppleTalk elsewhere if it is not currently enabled.

4. Select your printer from the list of AppleTalk network printers.
5. Click Add.

Change the PostScript encoding each time you print

This is an example using Adobe Photoshop:

1. In the Photoshop Print window, click "Show More Options".
2. Choose **ASCII** from the **Encoding** pop-up menu.
3. Click Print.

Print to a "BINPS" print queue.

1. Open Print Center (Mac OS X 10.2) or Printer Setup Utility (Mac OS X 10.3).
2. Click the Add button.
3. Choose **IP Printing** from the top pop-up menu. The Printer Type pop-up menu should now say "LPD/LPR".
4. Enter the printer's IP address or hostname in the Printer Address field.
5. In the Queue Name field, type: "BINPS".

   Note: For Mac OS X 10.2, first deselect "Use default queue on server".

6. Click Add.

"BINPS on <printer address>" appears In the Printer List. Choose this printer when you print from Adobe Photoshop.

Figure 1 Printer List with BINPS queue (Mac OS X 10.3.1)

Mac OS X: Address Book doesn‘t respond in Fax window

This article has been archived and is no longer updated by Apple.

In Mac OS X 10.3 or later, you may see Address Book in a Fax window when you click its button, but you might not be able to select contacts whom you want to send a fax. You can only click the Cancel button.

This can happen in some applications, including iCal, Stickies, Microsoft Office applications, and Fire Instant Messenger.

As a workaround, type the fax recipient's fax number in the To field (pictured below). If the recipient is in Address Book, type his or her name, and the fax number should fill in automatically.

Tip: Sometimes the contact's information may not be completed correctly. If this happens, see "Mac OS X 10.3: Fax Address Is Incorrectly Completed."

Follow these steps to use Address Book:

1. In the Print dialog, click Preview instead of Fax. The Preview application opens.
2. From the **File** menu, choose **Print**.
3. Mac OS X 10.3 users: In the Print dialog, click the Fax button. Mac OS X 10.4 users: In the Print dialog, choose **Fax PDF** from the **PDF** pop-up menu.
4. Click the Address Book button.
5. Select the recipient.
6. Click Fax.

This document will be updated as more information becomes available.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X: About the Mac OS X 10.3.2 Update

This software updates Mac OS X version 10.3 or 10.3.1 to version 10.3.2.
This article has been archived and is no longer updated by Apple.
This information is available in:

Français | Deutsch

Important: Read Before Installing

1. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.
2. To update to Mac OS X 10.3.2, you must enter the password for an administrator account. The password cannot contain a space or special characters typed by pressing the Option key. You can change the password in Accounts preferences if you need to.
3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Featured Software to install.

Installation

There are two ways to update to Mac OS X 10.3.2: Software Update and Standalone Installer.

Software Update Installation

You may have been referred to this document by Software Update. For more information on this feature, see technical document 106704, "**Mac OS X: How to Update Your Software**".

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

An installer is also available from Apple Featured Software (http://www.apple.com/swupdates/).

Mac OS X 10.3.2 Update updates Mac OS X 10.3 or 10.3.1 to the later version. This document describes how to use this installer.

Enhancements

These are some of the enhancements that are part of Mac OS X 10.3.2 Update:

Address Book and Mail enhancements

- Mail moves messages marked as junk to the Junk mailbox more reliably.
- In Address Book, you can now configure Exchange synchronization with either a hostname or full server URL, including a (https://) URL to automatically use SSL.
- Improves syncing between Address Book and Microsoft Exchange.
- You can now move an email to a different mailbox if you use an email server that previously didn't allow this.
- Improves results when using Mail with a .Mac or IMAP account and an SSL connection.
- Improves text sizing when printing from Mail.

Networking enhancements

- Improves results when looking for SMB-based servers in the Network view.
- Resolves an issue in which the Mac OS X firewall could no longer be available if you performed an upgrade installation of Mac OS X Panther.
- Allows automatic configuration of proxy servers using Proxy Auto Configuration (.pac) files.
- Resolves an issue that could prevent the computer from getting a DHCP lease after certain kernel extensions were unloaded and reloaded.
- Improves DNS for Mac OS 10.2 clients that use a shared Internet connection from a Mac OS X Panther computer.
- Resolves an issue that could prevent you from getting or maintaining an IP address via DHCP under certain conditions.
- Addresses an issue in which the L2TP VPN could not connect with leftover racoon.pid.

Print and fax enhancements

- The size of printouts from certain applications, including Safari, has been fixed.
- Addresses an issue in which a "No pages were selected to be printed in this document" alert appears when printing from Mail, Safari, iPhoto, or Preview, and then the application unexpectedly quits.
- Improves compatibility for Microsoft Virtual PC 6.1's emulated printing features.
- You can now save faxes in a folder whose name includes 2-byte characters.
- Addresses an issue with some USB PostScript printers, including the HP LaserJet 2300, Lexmark E310, and GCC Elite 21, in which a "Printer not responding" message appears when you add the printer in Printer Setup Utility, or when you try to print.
- Improves compatibility for Brother HL 1240 printers when used on an AirPort network with Rendezvous; an alert message with "-9672" could appear when adding the printer.
- Addresses an issue in which an application could unexpectedly quit when sending a fax to several recipients.
- Improves compatibility for some Lexmark printers when they print an A4-sized page.
- Improves reliability of Mac OS X Panther's fax email delivery feature.

Finder and other enhancements

- Addresses issues that could keep a disk image from appearing in the Finder when you open its file.
- You can now eject a FireWire-based volume from the Finder without entering an administrator password.
- Improves security of background applications when Screen Saver is on, and when entering a Screen Saver password.
- The Repair Permissions utility no longer reports a permissions issue with the printer.conf file.
- Character Palette no longer appears when you log in or after the computer wakes from sleep.

- iTunes will keep importing songs from an audio CD if you switch to another account.
- FileVault no longer prompts to recover unused disk space each time you log out; it will now ask only when needed.
- A Font Book collection's name, if it included a slash, or solidus, character ("/"), could cause issues; you can no longer use a slash in a Font Book collection's name.
- Addresses an issue in which a PowerBook G4 computer may stop responding when a Classic application's window is moved.
- The consonant of the first character for certain words entered using the Simplified Chinese ABC input method is no longer ignored.
- Improves compatibility for CH Products' joysticks and flight yokes.
- Improves compatibility for MagTek credit card readers.
- Improves reliability of third-party FireWire audio hardware devices.
- More reliably recognizes some FireWire devices, including the iSight camera.
- Addresses an issue with iChat AV (Italian) in which you couldn't join a chat room that you were invited to.

Published Date: Oct 11, 2016

Mac OS X 10.3: Kernel Panic When Using iSub

Mac OS X 10.3.2 Update resolves an issue that can cause a kernel panic when an iSub speaker plays audio. Harmon Kardon Soundsticks with iSub, for example, include an iSub speaker.

This article has been archived and is no longer updated by Apple.

The kernel panic message may include information such as "Apple02DBDMAAudio" and "IOAudioFamily" in the backtrace.

Download and install Mac OS X 10.3.2 Update to resolve this issue.

Apple System Profiler: Palm OS Devices Don‘t Appear on USB

It's OK if your Palm OS device (http://www.palm.com/) doesn't appear in Apple System Profiler even though it is connected to the computer's USB port.

This article has been archived and is no longer updated by Apple.

The USB connection from your computer to your USB-based Palm OS device, such as a PDA, is only active when you are performing a HotSync.

You can test whether the connection is detected by your computer, by pressing the HotSync button on the device's cradle or cable, then refreshing the Apple System Profiler window before the sync is complete.

Mac OS X 10.3: Some included Epson drivers aren‘t installed

This article has been archived and is no longer updated by Apple.

Mac OS X Panther includes many Epson printer drivers, but they're not all installed by default. You can easily install one you need if Printer Setup Utility doesn't list your printer under EPSON USB, EPSON FireWire, EPSON AppleTalk, or EPSON TCP/IP.

Document 25588, "Mac OS X 10.3: Raster (Inkjet) Printer Drivers Included", lists all Epson inkjet printer drivers included with Mac OS X 10.3 Panther.

Note: Printer drivers included in the Epson Printer Drivers 1 package are installed by default. Drivers included in the Epson Printer Drivers 2 package are not. If your driver isn't installed, it's probably in the Drivers 2 package or not included with Mac OS X Panther. If it's not included, see if it's available from Epson's website (http://www.epson.com/). Later versions of printer drivers, even ones included with Mac OS X Panther, may be available there, too.

Follow these steps to install an Epson driver from the Epson Printer Drivers 2 package:

1. Check document 25588 to see if your printer's driver is part of the Epson Printer Drivers 2 package.
2. Insert the Mac OS X 10.3 Install Disc 3 or Mac OS X 10.3 Software Install DVD.
3. Open the Packages folder on the Install CD.

   If you have an Install DVD, note the name of the installation DVD as it appears on the desktop (such as "iMac Software"), then do this: From the Finder's **Go** menu, choose **Go to Folder**. Type:

   `/volumes/`{name of your DVD}`/System/Installation/Packages`
   Click Go.

4. Double-click EpsonPrinterDrivers2.pkg.
5. Follow the onscreen instructions to install the software.

Your printer's driver, and others in the Drivers 2 package, will be installed.

Mac OS X 10.3: Administrator authentication allows root privileges in Finder for 5 minutes

This article has been archived and is no longer updated by Apple.

If you authenticate with an administrator account to allow a restricted task in the Mac OS X 10.3 Finder, the logged-in account will have root privileges for 5 minutes. Also, each time you log in with an administrator account, you have root access for 5 minutes.

Note: This document applies to Mac OS X 10.3 through 10.3.9. This document also applies to Mac OS X Server 10.3 through 10.3.2.

This behavior changes in Mac OS X 10.3.3 and later, which require an administrator to authenticate each Finder action that needs authentication, such as installing software.

When a user authenticates and is granted root privileges in the Finder, she can edit or delete system files, among other things.

Example: You can log in with an administrator account and perform a root-level task in the Finder within the first 5 minutes, including dragging the System directory to the Trash. There is no warning when you do this. After 5 or more minutes of logging in, Finder asks you to authenticate to before performing the same task.

Example: A user who does not have administrator privileges tries to copy a .kext file to the /System/Library/Extensions/ directory. An authentication dialog appears. A person with an administrator account authenticates and Finder copies the .kext file. For the next 5 minutes, the user who does not have administrator privileges can perform any action in the Finder that usually requires administrator authentication.

This is the expected behavior for Mac OS X 10.3 through 10.3.2. Download and install Mac OS X 10.3.3 Update or later if you wish to avoid this.

Mac OS 9.2.2: Remote Access "Answering" Option Doesn‘t Stay Selected; Can‘t Open Remote Access Control Panel

Learn what to do if you can't open the Mac OS 9.2.2 Remote Access control panel and the "Answering..." option doesn't remain selected when you restart the computer.

This article has been archived and is no longer updated by Apple.

Symptom

- The Remote Access' "Answering..." option isn't selected after a restart and doesn't remain selected after the next restart.
- After restarting the computer, you can't open the Remote Access control panel. This message appears:

  "Remote Access requires the 'OpenTpt Remote Access' system extension which was not found in the Extensions folder. You may need to reinstall it, or restart the computer with extensions on."
- After restarting, you can't open the Remote Access Status application. This message appears:

  "Apple Remote Access version 3.0 (or later) is not installed on this computer. Apple Remote Access is software that allows you to connect to an AppleTalk or TCP/IP network using a modem."

Products affected

- Mac OS 9.2.2
- iBook (Late 2001)
- iBook (14.1 LCD)
- iBook (16 VRAM)
- iBook (14.1 LCD 16 VRAM)
- PowerBook G4 (Gigabit Ethernet)
- PowerBook G4 (DVI)
- iMac (Flat Panel) with serial numbers earlier than xx303xxxxxx
- iMac (Flat Panel 17-inch)
- eMac
- Power Mac G4 (Mirrored Drive Doors) - dual 1 GHz and dual 1.25 GHz models

Solution

1. Before restarting, open the Remote Access control panel.
2. Deselect "Answering..." in the Remote Access menu.
3. Restart.
4. Open the Remote Access control panel.
5. Choose "Answering..." from the Remote Access menu.
6. Select or deselect "Answer calls" as desired.
7. Click OK.

Mac OS X: Can‘t access Help content, or content is blank or missing links

This article has been archived and is no longer updated by Apple.

Learn what to do if you can't get to information in Help, such as Finder or iCal 1.5 Help.

When you open Help, for example, you might see a blank page, or three links instead of four, but none of them work (you might expect to see these working links: What's New, Overview, Contents, Website).

Blank window in Mac OS X 10.4 or later

Download and install the Mac OS X 10.4.6 Update or later if you experience a blank window issue. You may also need to follow the steps described in the next section one time.

All versions of Mac OS X

Follow these steps:

1. Quit Help Viewer if it is open.
2. Click the Finder icon in the Dock.
3. From the **Go** menu, choose **Go to Folder**.
4. Type: ~/Library/Caches/

   Tip: "~" means your Home, which you can also get to by going to the Users folder and opening your home folder.

5. Click Go.
6. Look for the "com.apple.helpui" folder.
7. Rename that folder to something else, such as "old Help cache folder".
8. Open Help Viewer.

You should be able to access the Help content now.

Mac OS X 10.3 and 10.4: DVD Player - Video behind Info window updates slowly after resizing window

Video displayed behind the Info window in DVD Player 4 may update slowly after you resize the video window (the frames-per-second rate drops).
This article has been archived and is no longer updated by Apple.

This can happen when the video window is resized so that it intersects with the transparent Info window.

To fix this, move either the video window or the Info window.

You can avoid this issue by not resizing the video when a movie is playing. **Note**: In Mac OS X 10.4 and later, the Info window is named "Navigator."

This document will be updated as more information becomes available.

Mac OS X 10.3: Faxing - Application Unexpectedly Quits When Sending to Many People

Update to Mac OS X 10.3.2, or fax to one recipient at a time if your application unexpectedly quits when you send a fax with Mac OS X Panther.
This article has been archived and is no longer updated by Apple.
Download and install Mac OS X 10.3.2 or later. You can get it by choosing Software Update from the Apple menu, or from the Apple Software Downloads website (http://www.apple.com/swupdates/).

If you're not ready to update, fax the same document to one recipient at a time.

Mac OS X 10.3: How to rename Finder Sidebar items

Learn how to rename items in the Mac OS X Panther Sidebar.
This article has been archived and is no longer updated by Apple.
Note: Some items can't be renamed, such as read-only media (optical discs), network volumes, or any item whose permissions or ownership does not permit changes by the current user.

To rename a volume or folder in the Sidebar

1. Select the item in the Sidebar.
2. From the **File** menu, choose **Get Info**.
3. Click the triangle next to "Name & Extension:".
4. Rename the item.
5. Press the Tab key or close the Info window.

To rename an application or document

1. Locate the item in the Finder (not in the Sidebar).
2. Select the item.
3. Press the Return key to make the name editable.
4. Rename the item.
5. Press the Return key to complete the change.

Mac OS X 10.3: Faxing - Some Multi-Purpose Fax Devices Don‘t Receive Faxes

Some multi-purpose fax devices, that are both a fax machine and a telephone, for example, may not receive faxes sent with Mac OS X Panther.
This article has been archived and is no longer updated by Apple.
Note: Devices that only send and receive faxes are not affected by this issue. Only multi-purpose (or combination) fax/telephone devices that use an auto-recognition mode to identify incoming calls are affected.

As a workaround, ask the recipient to set the device to receive a fax manually, then send the fax. Or, ask the recipient to set the device's receiving mode from auto-recognition to "fax only". Instructions should be available in documentation that came with the device.

Note: Even when the device is in "fax only" mode, you should still be able to use it for voice by picking up the receiver while the device is ringing.

Mac OS X: Mac OS X 10.3.2 Update Addresses Virtual PC 6.1 "Emulated" PostScript Printer Issue

If Microsoft Virtual PC 6.1 does not work with an "emulated" PostScript printer in Mac OS X Panther, update to Mac OS X 10.3.2 or later.
This article has been archived and is no longer updated by Apple.
Download and install Mac OS X 10.3.2 Update or later to avoid this issue.

If you're not ready to update, you can fix this by modifying the /etc/cups/cupsd.conf file.

1. Click the Finder icon in the Dock.
2. From the **Go** menu, choose **Go to Folder**.
3. Type: `etc/cups`
4. Click Go.
5. Double-click the "cupsd.conf" file. This dialog appears: "There is no default application specified to open the document 'cupsd.conf.'"
6. Click Choose Application.
7. In the Choose Application dialog, the Applications folder is already selected. Select TextEdit, then click Open.
8. In TextEdit, scroll through the document until you see "ServerName 127.0.0.1".
9. Click on the empty line that appears below ServerName.
10. Type: `MinCopies 0`
11. From the **File** menu choose **Save**.
12. Close the TextEdit window.

iSync: Frequently Asked Questions (FAQ) About the Sony Ericsson P800 Phone

Find answers to common questions about using iSync with a Sony Ericsson P800 phone.
This article has been archived and is no longer updated by Apple.
Questions answered in this document:

1. What tips should I follow before using my phone with iSync?
2. I'm having issues pairing my P800 to my Mac.
3. I've paired my phone successfully, but now an error appears in iSync that says the Bluetooth connection has gone down, and I can't sync any data.
4. I've successfully paired my phone to my Mac and have synced a few times without any issues. However, I can only sync contact information; the option for syncing calendars is not available.
5. An error appears in iSync that says the sync failed because I'm trying to push too much information to the P800.

Question 1: What tips should I follow before using my phone with iSync?

Answer: Here are some basic tips:

- Make sure you have the latest Bluetooth software installed from the Apple Bluetooth website.
- Make sure you are using a compatible Bluetooth USB adapter or have a Mac with built-in Bluetooth. For compatible Bluetooth adapters, see the Apple Bluetooth website.
- If you are using a Bluetooth USB adapter, try connecting it directly to the computer instead of a hub or the keyboard.

Question 2: I'm having issues pairing my P800 to my Mac.

Answer: For best results, use the Bluetooth setup assistant, available in the Bluetooth preferences, to pair the phone to your Mac.

If you are still having issues pairing your phone, see technical document 93179, "iSync: Troubleshooting Connections With Symbian OS Phones (P800, 7650, and 3650)".

Question 3: I've paired my phone successfully, but now an error appears in iSync that says the Bluetooth connection has gone down, and I can't sync any data.

Answer: See technical document 25599, "iSync: Bluetooth Connection Fails When Syncing With Sony Ericsson P800 Phone".

Question 4: I've successfully paired my phone to my Mac and have synced a few times without any issues. However, I can only sync contact information; the option for syncing calendars is not available.

Answer: Download and install iSync 1.2.1 or later. Use Software Update preferences, or go to the iSync website.

Question 5: An error appears in iSync that says the sync failed because I'm trying to push too much information to the P800.

Answer: Read technical document 25595, "iSync: About Syncing Large Amounts of Data at One Time".

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X 10.3: Can‘t send or receive faxes without /var/spool/lock Folder

Mac OS X Panther can't send or receive faxes if a specific folder is missing.
This article has been archived and is no longer updated by Apple.
When you try to send a fax, the status message for the Internal Modem says, "There was a software fax error".

The modem doesn't answer after the number of rings you specified in Print & Fax preferences.

Follow these steps to fix this:

1. Click the Finder icon in the Dock.
2. From the **Go** menu, choose **Go to Folder**.
3. Type: `/var/spool`
4. Click Go.
5. Look for a folder named "lock". If you don't see it, follow the steps below. If you see this folder, troubleshoot for other conditions.
6. From the **Go** menu, choose **Utilities**.
7. Open Terminal.
8. Type: `cd /var/spool`
9. Press Return.
10. Type: `sudo mkdir lock`
11. Press Return.
12. Enter your admin password when prompted.
13. Quit Terminal when finished.

Mac OS X 10.3: PowerBook G4 Behaves Unexpectedly After Changing Display Resolution

With Mac OS X Panther, a PowerBook G4 or PowerBook G4 (Gigabit Ethernet) computer may experience issues when the display resolution changes.
This article has been archived and is no longer updated by Apple.
The computer behaves unexpectedly when you or an application changes the display resolution. Some examples of this behavior include:

- A slideshow doesn't advance when played in Keynote.
- The screen turns a solid blue color or the computer stops responding ("crashes") when you turn on full screen Visuals in iTunes or change the resolution in Display preferences.

Download and install Mac OS X 10.3.3 Update or later to avoid this issue.

If you're not ready to install, these tips can help:

This does not affect video on an external display, if one is connected.

If you need a workaround, you can try this: Put the computer to sleep by closing the lid, then wake it from sleep.

Mac OS X: How to install files into the Classic System file

This article has been archived and is no longer updated by Apple.

Learn how to install script bundles, keyboard layouts, and sound files into the Classic System file in the Mac OS 9 System Folder.

In Mac OS 9, you install script bundles, keyboard layouts, and sound files by dragging them onto the System Folder. The operating system then puts them in the System file. In Mac OS X, you can add the same files to the System file by following these steps.

Mac OS X 10.3, 10.4 and later

1. Open the System Folder that is used by Classic.
2. Drag the script bundle, keyboard layout, or sound file into the Appearance folder in the Mac OS 9 System Folder.
3. Use Classic preferences to restart Classic if it is running.

Mac OS X 10.2.8 or earlier

1. Start your computer from Mac OS 9. If you don't know how, see technical document 106667, "**How to Switch Between Mac OS 9 and Mac OS X**".
2. Drop the files on the System file icon in the Mac OS 9 System Folder.
3. Start from Mac OS X again.

Mac OS X 10.3 Tip: Dragging a print job to another printer queue

A print job might not print with Mac OS X Panther if you drag it to the queue of a printer that has different capabilities.
This article has been archived and is no longer updated by Apple.
Tip: For best results, only drag jobs between print queues of printers that have similar capabilities, such as the size of paper it can handle.

Tip: For best results, download and install Mac OS X 10.3.3 Update or later.

Usually, print jobs will print OK if you drag them from a PostScript printer queue to another PostScript printer queue, from an inkjet printer queue to another, or from an inkjet printer queue to a PostScript printer queue.

This document will be updated as more information becomes available.

Mac OS X 10.3: No "Other" option at login

Sometimes the Mac OS X Panther login window does not offer an "Other" choice.
This article has been archived and is no longer updated by Apple.

Solution

1. At the login window, type the first character in the name of a listed user. This will highlight that user's name.
2. Press Option-Return.

Login window will present text boxes for entering a name and password. You can now log in as any valid user.

Note: The Other option does not appear when NetInfo is turned off in Directory Access.

Published Date: Oct 11, 2016

Mac OS X 10.3: Calculator "rounding errors"

This article has been archived and is no longer updated by Apple.

Sometimes, Mac OS X 10.3 Panther Calculator results may include "rounding errors". Choose a lower **Precision** setting from the **View** menu to avoid this issue in the main Calculator window.

Note: This document applies to Mac OS X 10.3 through 10.3.9.

Sometimes you may see different results in the Paper Tape window. For example, if you calculate 77 + .1, the result is 77.1 in the Calculator window as expected; but the Paper Tape window displays a result of "77.09999999999999".

Since Calculator uses floating-point arithmetic, the calculation is the expected result. Choose a lower **Precision** setting from the **View** menu to avoid this issue in the main Calculator window.

Additional information

For an advanced discussion of why this happens, see "What Every Computer Scientist Should Know About Floating-Point Arithmetic" (http://docs.sun.com/source/806-3568/ncg_goldberg.html).

Mac OS X 10.3: Getting automatic PPPoE connections to work

This article has been archived and is no longer updated by Apple.

Learn about Mac OS X 10.3 Panther's automatic PPPoE (point-to-point protocol over Ethernet) connection feature and what to do if it doesn't work.

Note: For Mac OS X 10.4 or later information, see this article.

Mac OS X can automatically establish a PPPoE connection when it needs to connect to your Internet service provider. For example, Mac OS X will connect for you when Safari or Mail needs to access the Internet.

To use this feature:

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **Network**.
3. From the **Show** pop-up menu, choose **Built-in Ethernet**.
4. Click PPPoE.
5. Click the PPPoE Options button. **Note**: This only appears if "Connect using PPPoE" is selected.
6. Select the "Connect automatically when needed" option.

If automatic connection does not work

In some situations this feature may not work, even if it is selected in Network preferences. These include:

- When you cancel a PPPoE connection attempt while the connection is being established, or you manually disconnect after an automatic connection.

  Note: When this happens, the PPPoE option "Connect automatically when needed" still appears to be enabled even though your canceling it has disabled it.

  To connect, choose Connect from the PPPoE menu bar item, change any PPPoE setting, put the computer to sleep and wake it, change your network location, or restart the computer. Then, attempt an automatic connection such as with Safari or Mail.

- After three failed automatic connection attempts

  The auto-connect feature turns itself off if a PPPoE connection can't be made in three attempts. When this happens, it probably means there is an issue with your PPPoE configuration, or with the physical connection to the modem. Make sure the configuration and connections are correct.

  Note: In this case, Mac OS X uses the next network port as set in Network preferences (such as AirPort or Modem) to connect to the Internet.

  Once you have the correct PPPoE configuration and a working connection, restart the computer, put it to sleep and wake it, or change your network location to use automatic connection.

iChat AV (Italian), Mac OS X 10.2: Can‘t Join Chat Room

If you can't join a chat room with iChat AV (Italian), there are two workarounds. You may temporarily use a different language or edit a resource file.

This document applies to Mac OS X versions 10.2 to 10.2.8.
This article has been archived and is no longer updated by Apple.
When you try to join a chat room, the button "Entra" (Go) in the window "Entra In chat ..." (Go to Chat) is dimmed.

Note: You can join a chat only if you are invited to it.

There are two workarounds. Use either one.

Workaround: Temporarily change the language

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **International**.
3. Drag a language other than Italian, such as English, to the top of the list of languages.
4. From the **Apple** menu, choose **Log Out**.
5. Log back in and try to join or create a room.

Advanced workaround: Edit a line in a text file

You only have to do this one time.

1. Click the Finder icon in the Dock.
2. From the **File** menu, choose **Go to Folder**.
3. Copy and paste (or type) this folder's pathname into the field:

   ```
   /System/Library/PrivateFrameworks/InstantMessage.framework/iChatAgent/Contents/Resources/Italian.lproj
   ```

4. Click Go.
5. Open the file "AIMLocalizable.strings" with a text editor, such as TextEdit.
6. In the editor, change the second line from:

   ```
   "FullNameOfAIM" = "Servizio Messaggi Istantanei AOL"
   ```

   To:

   ```
   "FullNameOfAIM" = "AOL Instant Messenger";
   ```

7. Quit the editor and save the changes.
8. Restart or log out and back in.

Published Date: Feb 17, 2012

Mac OS X 10.3.2 Update: Only install on startup disk

You should install Mac OS X 10.3.2 Update or Mac OS X Server 10.3.2 Update only on the disk you've started from. Applications, including Mail, Address Book, and Network Image Utility, are not properly updated when installing on a volume other than the one you've started from, even though the update appears to install successfully.
This article has been archived and is no longer updated by Apple.
The best way to install the update on a different disk is this: Start up from it first, then install (or reinstall) the update. You can use the same installer package you downloaded on the original volume, or you can download and install the update again using Software Update preferences.

Alternatively, you can copy the affected applications from a properly-updated Mac OS X 10.3.2 volume to the other volume, and replace the older versions. "Other volume" or "other disk" can include a different partition of the same hard disk, or an external volume, such as an external FireWire hard disk.

For Mac OS X 10.3.2, these applications are updated:

- Terminal.app
- Bluetooth Setup Assistant
- Bluetooth Serial Utility
- Bluetooth File Exchange
- Safari
- Mail
- Font Book
- Address Book

For Mac OS X 10.3.2 Server Update, these are also updated:

- Workgroup Manager.app
- Server Assistant.app
- Server Admin.app
- QTSS Publisher.app
- Network Image Utility.app

Additional information

Verification

To verify a successful installation, select the Mail icon in the Applications folder, then choose Get Info from the File menu. The Version line should say "1.3.2".

Creating a NetInstall image (advanced)

To create a NetInstall image of Mac OS X 10.3.2, you must install 10.3, then start up from that system and install Mac OS X 10.3.2 Update. You can then create a NetInstall image from the installed system.

About Mac OS X 10.3.3

If you're started from Mac OS X 10.3.3 or later, you can install a Mac OS X update on volumes other than the startup disk and this issue won't occur.

If you're started from Mac OS X 10.3.2, Mac OS X 10.3.3 Update should only be installed on the startup volume to avoid this issue.

Published Date: Oct 11, 2016

Mac OS X: Getting notified when a new fax arrives

This article has been archived and is no longer updated by Apple.

Mac OS X 10.3 or later can notify you when a fax arrives. **Tip**: If you don't already know how to receive faxes, check out this (for Mac OS X 10.5); this (for Mac OS X 10.4); or this document (for Mac OS X 10.3).

There are several ways to receive notification.

Notification by email

Mac OS X 10.3, 10.4

1. Open System Preferences and click Print & Fax.
2. Click Faxing.
3. Select the "Email to" checkbox and type an email address in the "Email to" field. You can also choose addresses directly from Address Book by clicking the Address Book button to the right of the "Email to" field.

Tip: If email notifications are not getting sent, see this article.

Mac OS X 10.5

1. Open System Preferences and click Print & Fax.
2. Select the modem you are using to receive faxes and click the Receive Options... button.
3. Select the "Email to" checkbox and type an email address in the "Email to" field. You can also choose addresses directly from Address Book by clicking the Address Book button to the right of the "Email to" field.

Print the fax automatically

Mac OS X 10.3, 10.4

1. Open System Preferences.
2. Click Print & Fax.
3. Click Faxing.
4. Select the "Print on printer" checkbox, and choose a printer from the pop-up menu.

Mac OS X 10.5

1. Open System Preferences.
2. Click Print & Fax.
3. Select the modem you are using to receive faxes and click the Receive Options... button.
4. Select the "Print to" checkbox, and choose a printer from the pop-up menu.

Onscreen notification

Use AppleScript and Folder Actions to set this up. Follow these steps:

1. Open Folder Actions Setup, located in the AppleScript folder, which is in the Applications folder.
2. Select "Enable Folder Actions".
3. Click the "+" button.
4. Select the folder where received faxes are saved.

   Note: The default location is /Users/Shared/Faxes, but may have been changed in Print & Fax preferences.

5. Click Open.
6. The Choose A Script sheet appears. Click "add - new item alert.scpt".
7. Click Attach.
8. Quit Folder Actions Setup.

When a fax is received and saved to the folder, an alert will now appear.

Mac OS X 10.3: Disabling Fonts in Font Book Does Not Affect Classic Applications

"Classic Mac OS" fonts disabled in Font Book are still available in Classic applications.
This article has been archived and is no longer updated by Apple.
You can use Font Book to control which fonts are available to Mac OS X applications. Fonts installed in the Mac OS 9 System Folder can be disabled using Font Book's Disable feature. A "disabled" font becomes unavailable to Mac OS X applications, but continues to be available to Classic applications. Disabling a font in Font Book is different than removing it.

To make a font unavailable to Classic applications, remove it from the Mac OS 9 System Folder. For help doing this, see technical document 106737, "**Mac OS X: How to Add or Remove Classic Fonts.**"

Mac OS X 10.3: DVD Player - Unexpectedly Quits When Second Video Card Is Installed

DVD Player may unexpectedly quit if a second PCI video card that doesn't support DVD playback is installed in your computer. This document applies to Mac OS X 10.3 through 10.3.2.
This article has been archived and is no longer updated by Apple.
Download and install Mac OS X 10.3.3 Update or later to avoid this issue.

If you're not ready to install, this issue can occur even if the second video card isn't being used for the main display. To fix this, remove the second video card.

Published Date: Oct 11, 2016

Mac OS X 10.3: Address Book - Sharing vCards With Mac OS X 10.2

Mac OS X Panther Address Book vCards can contain more kinds of information than vCards in Mac OS X 10.2.
This article has been archived and is no longer updated by Apple.
Mac OS X Panther Address Book vCards can have these additional fields:

- Phonetic First Last Name
- Prefix
- Middle Name
- Suffix
- Nickname
- Maiden Name
- Job Title
- Phone
- Email
- Home Page
- Birthday
- Dates
- Related Notes
- Instant Messaging
- Address

Mac OS X 10.2 Address Book vCards, however, only have these additional fields:

- Phonetic First Last Name
- Birthday
- Instant Messaging

When you send or copy a vCard from a Mac OS X 10.3 computer to a Mac OS X 10.2 computer, information in the Mac OS X 10.3 additional fields (except Phonetic First Last Name, Birthday, Instant Messaging) appear in the vCard's Notes field.

The extra information is not visible to other Mac OS X 10.3 users who receive the vCard, however.

Mac OS X 10.3: How to Restore Mailboxes From a Backup on a Burned Disc

Learn how to restore mailboxes you backed up to a CD or DVD in Mac OS X 10.2 so you can use them with Mail in Mac OS X Panther.

Note: For best results, follow the steps in this document before using Mail in Mac OS X Panther for the first time. If you've already used Mail, see the warning below before proceeding.
This article has been archived and is no longer updated by Apple.
If you saved a backup of Mail messages or mailboxes (whose filename extension is ".mbox") to a CD or DVD in Mac OS X 10.2, copy the .mbox files to a certain folder in your home directory so you can use them in Mac OS X Panther Mail.

Warning: If you've already used Mail in Mac OS X Panther, you must take certain steps to prevent any messages you've received from being lost when you restore your backup. To keep any messages you may have received since you made the backup, copy them to a new mailbox that has a special name first. To do this, create a new On My Mac mailbox with a unique name (one you didn't use in Mac OS 10.2), drag the newer messages to it, then follow the steps below.

Restoring from a backup

1. Start from Mac OS X Panther if you haven't already, and insert the disc you used to make your backup.
2. Quit Mail if it's open.
3. From the **Go** menu, choose **Go to Folder**.
4. Type: ~/Library/Mail/Mailboxes
5. Click Go.
6. From the **File** menu, choose **New Finder Window** and open the folder on the disc where your backed up mailboxes are saved.
7. Drag the .mbox files from your backup disc to the Mailboxes folder you opened in Step 5. If the Finder alerts you that you're replacing newer mailboxes, see the warning above to make sure you won't lose messages. If you're sure you've saved your mail in Mac OS X Panther, click Replace.
8. Open Mail. The restored mailboxes automatically appear in Mail.

At this point, you may wish to make a backup of your Mac OS X Panther mailboxes.

Mac OS X: Korean "Ga" Character Appears in a Square When Typing Hangul Text

While typing Korean text using the Hangul input method, you may see the Korean character "Ga" in a square when a syllable is incomplete or not an actual Korean word.
This article has been archived and is no longer updated by Apple.
Mac OS X 10.3 Panther can display the full set of over 11,000 Korean characters using Unicode fonts. However, the system fonts in Mac OS X 10.3 and Mac OS X 10.2 do not include all extended Korean characters. Because of this, the Korean character "Ga" may sometimes appear in a square if you're using the Hangul input method.

Figure 1 - "Ga" in a square

This can happen when the Korean script is converted from the phonetic alphabet, or Jamo, to Hangul, which consists of clusters of Jamo characters. You may see Ga in a square when a cluster of Jamo characters is incomplete or does not yet create an actual Korean word. This occurs when the Jamo cluster is within the extended range and outside the standard range provided by the system font. Once the character cluster is completed, typed correctly, or another Jamo vowel is added for the next syllable, the text should display properly.

With Mac OS X 10.3, one workaround is to install a third-party Unicode font that includes the full set of Hangul syllables. For information about third-party font solutions, see the Apple Korea font list website (www.applecomputer.co.kr/hardware/fontlist.html) .

Mac OS X: About the Mac OS X 10.3.3 Update

This software updates Mac OS X 10.3.2 to version 10.3.3.
This article has been archived and is no longer updated by Apple.
Important: Read Before Installing

1. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

2. To update to Mac OS X v10.3.3, enter an administrator account password. The password cannot contain a space or special characters typed by pressing the Option key. You can change the password in Accounts preferences if you need to.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.

4. Advanced users: If you have made any changes to the /etc/ttys file, you should back it up before updating. The update overwrites this file.

Installation

There are two ways to update to Mac OS X v10.3.3: Software Update and Standalone Installer.

Software Update Installation

You may have been referred to this document by Software Update (as described in "Mac OS X: How to Update Your Software"). After reviewing this document, use Software Update to download and install the update.

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

An installer is also available from Apple Downloads.

Mac OS X 10.3.3 Update updates Mac OS X 10.3.2 to the later version. This document describes how to use this installer.

This update can be installed on non-startup volumes if you start from a Mac OS X v10.3.3 volume first.

Enhancements

These are some of the enhancements that are part of Mac OS X 10.3.3 Update.

Networking and .Mac enhancements

- Addresses issues, such as a lost network connection, that could occur when connecting to a network device that forces the network speed and/or duplex setting (known as a "locked" device).
- AppleTalk Browsing is now on by default.
- Resolves an issue in which name conflicts could occur among Network Service Entities.
- Available servers can be seen when browsing Windows Workgroups or Domains.
- Enhancements to /Network browsing include: Servers appear on the desktop and in Finder window Sidebars, AFP Authentication options are available, and you can disconnect a server by dragging its icon on the desktop to the Trash or by clicking the Eject icon in the Sidebar.
- Improves synchronization between .Mac and your computer.
- .Mac no longer attempts to automatically sync files over a wireless network (or "hotspot") before the computer is authorized to use the network.
- Enhances an Open directory plug-in, which is used in network environments: The Active Directory plug-in is no longer sensitive to the case of the domain; the plug-in now works in ".local" domain environments; the plug-in is now less sensitive to DNS records that don't have matching reverse lookup.
- Improves compatibility with certain third-party wireless networking PC cards, such as the Honda AH-G10. More...
- Enhances the IrDA menu item when IrDA networking is active.
- Finder and applications that allow you to browse the file system will now refresh the contents of a remote network volume's folder or directory when the folder's contents change.

DVD Player enhancements

- DVD Player will no longer quit if an unsupported PCI video card is installed in your computer. More...
- DVD Player supports more DVD video discs that are designed to play automatically.
- Improved DVD playback when "Digital Audio Output" is selected in DVD Player preferences.
- DVD Player now recognizes and plays DVD+R media, on computers with optical drives that support DVD+R media.

Application enhancements

- Images retain their characteristics when you import them in iPhoto. More...
- Addresses an issue in which Mail could unexpectedly quit when marking some types of unsolicited messages (or "spam") as Junk.
- Addresses issues that may cause Address Book and other applications to unexpectedly quit if the Classic Mac OS fonts are disabled in Font Book.
- Text shadow opacity and color are saved in RTF documents and preserved when you copy or paste.
- Image Capture can now import files whose names begins with an underscore character ("_") .
- When you select (but not open) a file in an application, the flashing button now says "Choose" instead of "Open".

Other enhancements

- Improvements in start up time that some computers experienced under some installations of Mac OS X 10.3.2 Update. More...
- Improves security by requiring an administrator to authenticate for each Finder action that needs authentication, such as installing software. In earlier Mac OS X Panther versions, an administrator who authenticated may have unknowingly given elevated privileges to the non-admin user for 5 minutes. This change also prevents a normal user from performing administrator actions if an administrator user has authenticated during their session.
- Improves situations in which Finder could unexpectedly quit (and open again) if the View menu option "Show icon preview" is enabled while dragging a significant number of icons to another location.
- Improves print operations when a pending print jobs is moved to the queue of a printer that has different capabilities. More...
- Improves recognition of Hi-Speed USB devices by PowerBook G4 and iBook G4 computers when woken from sleep.
- A UPS (Uninterruptible Power Supply) panel is available in Energy Saver preferences, as well as a UPS menu bar item, when a UPS power management system is connected to the computer. Overall support for UPS systems is improved.
- Improves display of text when printing a document that contains two-byte PostScript CID or OpenType fonts.
- Improves compatibility for USB Overdrive: Addresses an issue in which the Media Eject and volume keys may not work if an early version was installed. More...
- Improves Fan Control system function for Power Mac G5 computers.
- Includes Bluetooth 1.5, which supports Bluetooth-enabled headsets with iChat AV, and adds the ability to print to compatible Bluetooth-enabled printers.
- Adds support for the latest mLAN devices. First-generation mLAN devices require a firmware update for compatibility with v10.3.3. Please visit (http://www.mLANcentral.com) for complete details and access to available firmware updates.
- For portable computers, adds an option in Keyboard & Mouse preferences to use Function keys for custom functions.
- Improves function when sending faxes to combination phone/fax machines.

Mac OS X: About the Mac OS X 10.3.3 Update (Combo)

This software updates Mac OS X 10.3, 10.3.1, or 10.3.2 to version 10.3.3.
This article has been archived and is no longer updated by Apple.
Important: Read Before Installing

1. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

2. To update to Mac OS X 10.3.3, enter an administrator account password. The password cannot contain a space or special characters typed by pressing the Option key. You can change the password in Accounts preferences if you need to.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.

Installation

There are two ways to update to Mac OS X 10.3.3: Software Update and Standalone Installer.

Software Update Installation

You may have been referred to this document by Software Update (as described in "Mac OS X: How to Update Your Software"). After reviewing this document, use Software Update to download and install the update.

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

An installer is also available from Apple Downloads.

Mac OS X 10.3.3 Update (Combo) updates Mac OS X versions 10.3, 10.3.1, or 10.3.2 to the later version.

This update can be installed on non-startup volumes if you start from a Mac OS X v10.3.3 volume first.

Enhancements

For a list of some of the enhancements that are part of Mac OS X 10.3.3 Update, see Mac OS X: About the Mac OS X 10.3.3 Update.

This update also includes enhancements delivered with Mac OS X 10.3.2 Update and Mac OS X 10.3.1 Update.

Mac OS X: Mail unexpectedly quits if Times RO font is installed

With Mac OS X 10.3.3 or earlier, Mail might unexpectedly quit if Times RO fonts are installed. Some HP printer software may install this font.
This article has been archived and is no longer updated by Apple.
Update to Mac OS X 10.3.4 or later to avoid this issue.

If you're not ready to update, you can use this workaround:

1. Click the Finder icon in the Dock.
2. Type "Times RO" in the Search field to search for the font. A list of Times fonts appears.
3. Drag "Times RO" font files to the Trash. Don't drag "Times New Roman" or other "Times" font files that may also appear in the search results.
4. From the **Apple** menu, choose **Restart**.

This document will be updated as more information becomes available.

Additional information

Although Times RO is known to lead to this issue, any other damaged or incompatible font could potentially do the same.

Some versions of stand-alone Hewlett-Packard (HP) printer software can install this font. More....

If you view a damaged Times RO font file with Font Book, it may look like this:

Mac OS X 10.3: Restoring a Mac OS 9 System Folder from a disk image file

Follow these steps if your computer can't start from Mac OS 9 after restoring the System Folder from a custom image with Disk Utility. Disk Utility is an application that can repair disk issues and permissions, create disk images, and restore data from custom disk images.

This document applies to Mac OS X 10.3 through 10.3.3. Update to Mac OS X 10.3.4 or later to avoid this issue.

This article has been archived and is no longer updated by Apple.
This document applies when:

- You restored a Mac OS 9 System Folder from a custom disk image.
- You can't start from the restored System Folder, but you can use it for Classic. If you try to start from it, a flashing question mark appears.
- The image was restored using Mac OS X Panther's Disk Utility application in Mac OS X 10.3 through 10.3.3.
- The affected computer can normally start from Mac OS 9. Some computers only start up in Mac OS X.

The solution to these symptoms is to restore the image using a Terminal command instead of Disk Utility. The command is "asr". For more information about restoring from custom disk images with the asr command, see Mac OS X 10.2: About Apple Software Restore command line utility (asr).

Example

If you're restoring **from** the custom disk image named "PHOBE.img" that is on the desktop, **to** a volume named "STEER", you'd do this:

1. Open Terminal (/Applications/Utilities/).
2. Type this command in Terminal, on one line:

```
sudo asr -source ~/Desktop/PHOBE.dmg -target /Volumes/STEER/ -erase
```

3. Enter your administrator account password when prompted.
4. Quit Terminal after the restore is complete.

Mac OS X: Spaces in PDF Text or iPhoto Book Appear as Two Dots

Text in a PDF file that was saved with third-party DynaFont TrueType fonts, which are used in some Japanese documents, may unexpectedly appear with two dots where a space is expected. It appears this way in some PDF viewers, such as Adobe Acrobat Reader, but not in the Mac OS X Preview application.
This article has been archived and is no longer updated by Apple.
For example, instead of "Hello there," the text may look like this: "Hello··there".

This can also happen when you order an iPhoto book that uses one of these fonts.

The solution is to view the PDF file in Preview where the text will appear as expected.

To avoid this issue, don't use these fonts in your document or iPhoto book.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please **contact the vendor** for additional information.

Mac OS X 10.3: Playing Video Compact Disc (VCD) media

You can play a Video Compact Disc (VCD) in Mac OS X Panther or later.
This article has been archived and is no longer updated by Apple.

1. Insert the VCD.
2. Open QuickTime Player, which is in the Applications folder.
3. From the **File** menu, choose **Open Movie in New Player.**
4. Click the VCD icon in the Sidebar.
5. Select the MPEGAV folder.
6. Select the file whose filename extension is ".DAT".
7. Click Open. The movie opens as a new window in QuickTime Player.
8. Click the Play button or press the Space bar to begin playing the movie

Tip: To play an SVCD (Super Video Compact Disc), you need to install third-party software such as Video LAN Client.

About VCD media

Video Compact Discs hold much less data than DVD-Video discs, even though the discs are physically the same size. The video stored on a VCD is typically lower quality than the video on a DVD.

VCD video is encoded in MPEG1 format.

My phone doesn‘t work with iSync after I reset it

iSync software lets you synchronize data between your computer and many kinds of mobile devices.
This article has been archived and is no longer updated by Apple.
If you've reset your Sony Ericsson P800 or P900 phone, Nokia 6600 phone, or a different phone, and iSync can't sync with it anymore, try this trick:

1. Before syncing with iSync, open the phone's Calendar application.
2. Quit the phone's Calendar application. This creates a database file on the phone that iSync needs.
3. Use iSync to sync the phone and the computer.

If your phone has been erased or reset to its default settings and has no calendar information, you may need to create a new calendar on the phone before syncing.

iSync 1.5 or earlier: Syncing contacts with Nokia 6350 and 3660 phones

This article has been archived and is no longer updated by Apple.

Some of the fields for a contact you created on your phone won't be synchronized and may be lost on the phone if you sync it with iSync 1.5 or earlier.

On your phone, if you create a contact, these contact fields are not synced:

- "Mobile (Home)" numbers
- "Mobile (Business)" numbers
- "Fax" numbers
- "DTMF" field
- "Address" fields
- "URL Address"
- "URL Address (Home)"

As a result, data in these fields may be removed from the phone after syncing.

To avoid this situation, create and edit contacts in Address Book instead of on the phone.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X 10.3: Address Book stops responding if Helvetica font is disabled

If you disable the Helvetica font, Address Book may not open, or may stop responding.

Address Book stores information about your contacts that can be used by many Mac OS X applications.
This article has been archived and is no longer updated by Apple.
Address Book uses the Helvetica font included with Mac OS X. Other kinds of "Helvetica" fonts might be installed, but Address Book requires the Apple font.

Use Font Book to enable Helvetica in the All Fonts font collection.

Tip: If you use third-party font management software, temporarily disable it.

This document will be updated as more information becomes available.

Additional information

The Apple version of Helvetica is located in this path: System/Library/Fonts/Helvetica.dfont. It may appear there even when it's disabled. Using Font Book's Resolve Duplicates feature may inadvertently cause this issue, depending on what other fonts you have installed.

The Console utility displays this message in the console.log when the issue occurs:

```
Address Book[3225] Exception raised during posting of notification.
Ignored.  exception: *** -[ABTextView setFont:]: nil NSFont given.
```

The number in brackets may differ.

Mac OS X 10.3: Receiving faxes and connecting to the Internet

If your computer has a built-in USB modem and you use it to connect to the Internet, selecting the "Receive faxes on this computer" option in Print & Fax preferences may keep the computer from connecting to the Internet more than once, unless you restart.
This article has been archived and is no longer updated by Apple.
The modem menu bar item may say the modem is "disconnecting." The Internet Connect Connection Log may say "Connect script failed."

To fix this, follow these easy steps.

1. From the **Apple** menu, choose **Restart**. The computer restarts.
2. Log in, if necessary.
3. From the **Apple** menu, choose **System Preferences**.
4. From the **View** menu, choose **Print & Fax.**
5. Deselect "Receive faxes on this computer".

Now you can connect more than one time without restarting the computer.

But what if I want to receive faxes?

Follow the steps above, but enable "Receive faxes on this computer" in the last step. Remember to deselect the option if you need to connect to the Internet more than one time before you restart or shut down.

This document will be updated as more information becomes available.

Mac OS X: Preview wants a password to open an unprotected PDF file

Why does Preview ask for a password when I open a PDF file with Mac OS X 10.3.3 or earlier?

Preview is a Mac OS X application that lets you view, create, and print PDF and graphics files.

This article has been archived and is no longer updated by Apple.
Some other applications can create PDF files and assign a password to them. Preview will ask for this password if needed.

However, with Mac OS X 10.3.3 or earlier, Preview might ask for a password even if the document isn't password-protected.

This message appears:

> "This PDF is password protected. Without a password, some operations with this document will be restricted. Operations allowed are listed with a check mark next to them below.
> {list of options}
> To enable more operations, enter a password."

This is normal when a PDF file has been password-protected by its creator.

However, if other software (such as Adobe Reader) opens the file without asking for a password, use that application to view the PDF file for now. Update to Mac OS X 10.3.4 or later to avoid this issue.

Additional information

When you can't view a password-protected file in Preview, this icon appears instead of text:

A document's password is set by the document's creator, and isn't your user account password. Ask the creator for the password if you need it.

Safari bookmarks don‘t change when syncing via iSync and .Mac

If Safari bookmarks don't change after syncing them via iSync and .Mac, sync again.
This article has been archived and is no longer updated by Apple.
This can happen if Safari hasn't been opened at least once on the computer that's receiving the synced bookmarks.

Open Safari at least once on the Mac that will receive the bookmarks, then sync again. You'll be asked to merge or replace your bookmarks with those from your .Mac account.
Published Date: Feb 19, 2012

Mac OS X: Font stays the same when you revert input methods

If the font in your text application doesn't change back when you switch back to the original input method, select the text you typed and change the font. This can happen when you use two or more input methods in English, Chinese, Japanese, or Korean and are using a Mac OS X "Cocoa" application.
This article has been archived and is no longer updated by Apple.
For example, you start a document in a Cocoa text application using the English input method. You type some English text. You switch to a Korean input method and type some more text. All the text appears the way you'd expect--English in an English font and Korean in a Korean font. Then you switch back to the English input method and type more, but the new text is still in a Korean font.

To fix this, select the text to be changed, then use the application's **Font** menu (or **Show Fonts** menu choice in a differently-named menu) to change the font to what it should be.

To avoid this, use a Mac OS X "Carbon" application that doesn't experience this issue. You could, for example, type a document in one of these applications, then copy and paste the text into your Mac OS X application.

Tip: WorldText, a Carbon application, is available on the Developer Tools CD that came with your computer and with Mac OS X software installation discs.

This document will be updated as more information becomes available.

Importing photos in iPhoto or Image Capture as a limited or managed user

You can set up a limited or managed user's account so iPhoto or Image Capture can import photos.
This article has been archived and is no longer updated by Apple.
Follow these easy steps if a user can't import photos from a digital camera because the camera isn't recognized:

1. From the **Apple** menu, choose **System Preferences.**
2. From the **View** menu, choose **Accounts.**
3. Select the limited user account you want to give camera access.
4. Click Limitations.
5. Select "This user can only use these applications," if it isn't already, and make changes to the application limits, if desired.
6. Click Locate.
7. Navigate to /System/Library/Image Capture/Devices/.
8. Select all the items in this folder.
9. Click Add.

The limited user account should now be able to use iPhoto or Image Capture to import photos from the camera.

Mac OS X 10.3: PostScript or PDF file doesn‘t look like it should in Preview

Preview might display a PDF or PostScript file in an unexpected font or without all the expected characters. Don't worry. You probably just need to install some fonts to display the document properly.

Preview is a Mac OS X application that lets you view and print many kinds of files. PostScript filename extensions are ".ps", and PDF filename extensions are ".pdf".
This article has been archived and is no longer updated by Apple.
This can happen when every font used to create a PDF or PostScript document isn't embedded in it, and the necessary fonts aren't installed.

To fix this, install the fonts on your computer that were used to create the original document.

Tip: If you don't know what fonts those are, open the document with Adobe Reader. You'll see an alert that tell you which fonts were used to create the file and that you don't have installed.

This document will be updated as more information becomes available.

Mac OS X 10.3: Applications unexpectedly quit when you print

My applications crash when I print. It started happening after a "No pages were selected to be printed in this document" message appeared, and now happens in every Mac OS X application.
This article has been archived and is no longer updated by Apple.
One of these solutions should fix this and get you back to printing at will.

- Are you using Mac OS X 10.3.3 or later? If not, update your computer's software.
- Do you use an HP Photosmart printer? Download and installed driver version 2.3.6 or later. You can get it from Hewlett-Packard.
- If you use any other printer, download the latest driver from the manufacturer's website, then install it.
- If the issue persists when using custom printer presets and Mac OS X 10.3.2 or earlier, find and delete the file "com.apple.print.custompresets.plist". It's in your home folder's Preferences folder, which is in your home folder's Library folder (~/Library/Preferences).
  You'll need to recreate any custom presets that you've previously saved.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mail prints emails backwards and upside down (Mac OS X)

This article has been archived and is no longer updated by Apple.

You print from Mail, but the printout looks strange--backwards and upside down, that is. Instead of standing on your head and using a mirror to read it, try our helpful tips before you print.

Tip: Download and install Mac OS X 10.3.4 or later to avoid this. This document applies to Mac OS X 10.3.3 and earlier.

If you're not ready to update to Mac OS X 10.3.4 or later, you can use these workarounds:

- Copy what you want to print and paste it into a different application. Then print from it.
- Before you print, increase the size of the message's text. If you get carried away and the text becomes too big, you can make it smaller, but always keep it at least one size larger than what you started with to avoid the issue.

Mac OS X 10.3: Fax doesn‘t send

Learn how to make sure your faxes get sent.

Note: This document applies to Mac OS X 10.3 through 10.3.9.

This article has been archived and is no longer updated by Apple.
If you try to fax using a device that isn't connected to a phone line or isn't a fax modem, the fax won't send, even though the device appears in, and can be selected from, the Modem pop-up menu.

When you fax, a Fax dialog box appears. Choose a device that is designed to fax (such as an Apple internal modem or an external fax modem) in the Modem pop-up menu, in the Fax dialog box.

All internal Apple fax modems, many Bluetooth-enabled mobile phones (depends on your phone and service provider), and some external USB modems can fax with Mac OS X Panther. **Tip**: If your third-party fax device doesn't send a fax try the Apple internal modem. Contact the vendor of the third-party phone or modem for more information or assistance if needed.

Sometimes, a device that's not connected may appear in the menu, such as "Bluetooth-Modem" in the picture above. The rest of this article explains how you can remove unwanted choices from the Modem list if you want.

Additional information

You can remove unwanted modem choices from the Modem list, if they appear, with these easy steps. Don't worry. Removing the device from the list doesn't mean it will stop working with Panther. It just won't appear in the Modem pop-up menu.

Tip: Don't remove "Internal modem".

1. Print from any Mac OS X application.
2. Click the Fax button.
3. From the Modem pop-up menu, choose Show Fax List.
4. Uncheck "In Menu" next to the unwanted modem choice.

Devices might get on the list because they were once connected to your Mac, but no longer are.

Mac OS X 10.3: Which fonts are Apple fonts?

Learn how to figure out which of your fonts were supplied by Apple. This might be useful to know when troubleshooting a software issue, for example.

This document applies to Mac OS X 10.3 through 10.3.4.

This article has been archived and is no longer updated by Apple.
Here's how to do it in the Finder:

1. Open the Fonts folder you wish to look at. Fonts may be in more than one location.
2. Select a font.
3. From the **File** menu, choose **Get Info** (or press Command-I).
4. Look at the "Copyright" line. If you see "Apple Computer" in the copyright, it's an Apple font.

5. Repeat these steps for other fonts you want to check out.

And here's how you can do this with Mac OS X Panther Font Book, if you want:

1. Hop on over to the Applications folder and open Font Book.
2. From the **Preview** menu, choose **Show Font Info** (or press Command-I). If Font Info is already shown, you don't need to do this.
3. Select each font you want to check out. Look in the Font Info section (which is below the preview).
4. Look at the "Foundry" link. If you see "Apple Computer" in the copyright, it's an Apple font.

Tip: Just select one font at a time; "-" appears in all Font Info lines if more than one font is selected.

Tip: Want to see a complete list of fonts that can be installed by Mac OS X Panther? Check out Mac OS X 10.3: Fonts list.

Some fonts that come with Mac OS X 10.3 do not have "Apple" on the Get Info-Copyright or Font Book-Foundry lines. They include:

- Arial, Arial Black
- Big Caslon
- Comic Sans MS
- Copperplate
- Courier New
- Didot
- GB18030 Bitmap
- Helvetica Neue
- Optima
- Times New Roman
- Trebuchet MS
- Webdings

You see a "buffer underrun" error when burning a disc in Finder or iTunes

This article has been archived and is no longer updated by Apple.

Learn about "buffer underrun" issues that can happen when you burn a CD or DVD on your Mac. Some of this information is specific to Mac OS X and internal Apple recordable optical drives.

Tip: Many newer optical drives contain buffer-underrun protection. To find out if your optical drive has buffer underrun protection, open Terminal (/Applications/Utilities) and type this command: "`drutil info`" . If you see "BUFE" in the returned results, then your drive has buffer underrun protection. Mac OS X 10.3, 10.4 or later may report buffer underrun errors for burns that have failed for other reasons. If your drive has buffer underrun protection, and you see a buffer underrun error, the most common cause is dirty or scratched media.

"Buffer underrun"? What's that mean?

In a nutshell, it means the memory buffer (or temporary data storage location) inside your burner is not getting data from your hard drive fast enough to burn the disc.

If this happens with Mac OS X in the Finder, iTunes, or another burning application, you might see "Buffer underrun error" or "Unknown Error - 2147352480".

When this happens, the burn may fail and the partially-burned disc can be unusable.

What can cause "buffer underrun" issues?

- Your computer is trying to do too many things at once (for example, too many applications are open and using the Mac's resources).
- Your hard drive isn't supplying data to the burner fast enough.
- The disc you're burning may be scratched, dirty, or not work with your disc burner.
- The hard drive is very fragmented (though this is unlikely with Mac OS X or later).

In some cases, the optical drive itself might have a hardware issue, but this is not as likely.

What can I do if I run into this?

- The first and easiest thing you can do is don't use too many (or any) other applications when burning a disc.
- Restart your Mac and try again.
- Try using a different blank disc or a lower burn speed. Sometimes you might need to try a completely different type of writable media. See Factors That Affect Writing to or Reading From Optical Media.
- For Mac OS X 10.2, 10.3 or later and CD-R, CD-RW, or DVD-R media, see these tips.
- In some cases, installing more RAM or a faster hard drive can help.

Can I fax with my cable, ADSL, DSL, or ISDN modem using Mac OS X 10.3?

Learn about sending or receiving a fax with a cable, ADSL, DSL, or ISDN ("broadband") modem and Mac OS X Panther. This document's concepts also apply when using third-party faxing software.
This article has been archived and is no longer updated by Apple.
To fax, you need two things:

- A modem that sends and receives analog signals.
- A phone line that can carry analog signals (most do).

If you have an Apple internal modem, for example, you can use it to fax. Analog modems are also often used for connecting to the Internet via PPP, which is often not as fast as a broadband connection (but sometimes it can be, depending on the kind of phone line and Internet service provider).

Many broadband modems, on the other hand, don't use analog technology. They usually use digital signals instead, and connect to your computer's Ethernet port or USB port, not the modem port. While you can't use this kind of modem or connection to send or receive a fax with Mac OS X Panther, read the helpful tips below.

Tip: You might be able to fax using the same wall jack that your ADSL, DSL or ISDN modem uses, if that line allows analog calls and you don't mind performing a quick test. Try this to find out:

1. Temporarily disconnect the cable from your DSL or ISDN modem and plug it (the cable that goes between the modem and the wall) into a standard phone .

   Note: Don't force it in if it doesn't easily fit--Ethernet plugs, for example, look like phone plugs but don't fit into landline (RJ-11) phone jacks. There's a picture below that you can look at. If the cord is coaxial, like for cable TV and cable modems, it won't fit in the phone.

2. Use the phone if the cord fits. Do you hear a dial tone? Can you make calls?

If so, you may be in luck. You can probably use the same wall jack to send or receive faxes with Panther. Get in touch with your Internet service provider (ISP) if this works and you want to hook up both your analog modem and broadband modem to the same wall jack. Alternatively, just connect your analog modem to a standard phone jack and don't worry about your broadband modem's cord or jack.

Here's an example of what the computer's ports look like (they might be in a different arrangement on your computer). (1) is the USB port, (2) is the Ethernet port, (3) is the modem port.

Contact the manufacturer or the supplier of your modem if you are unsure what type it is or if you can make phone calls on the same line.

Apple Remote Desktop: Controlling a computer that‘s running the ARD Administration application

Usually, a computer running the ARD Administration application can't be controlled by another computer's ARD Administration application. But if you have client version 1.2.1 or later, that computer can be controlled. Learn what you need to do to set this up.

This article has been archived and is no longer updated by Apple.

These steps assume you have two computers, "A" and "B" below. You want to control computer B from computer A using ARD Administration. The computers are already configured so that B appears on A's computer list.

Both computers need ARD Client 1.2.1 or later installed.

1. Open Terminal on computer B and enter these commands, each of which should be typed on one line. They would normally prevent it from being controlled by another computer:

   ```
   sudo defaults write /Library/Preferences/com.apple.RemoteDesktop AdminConsoleAllowsRemoteControl -bool false

   sudo '/System/Library/CoreServices/ARD Agent.app/Contents/Resources/kickstart' -restart -agent
   ```

2. With Remote Desktop running on computer B, try to control it from computer A (and verify that you can't).
3. Open Terminal again on computer B and enter these commands, each of which should be typed on one line:
   ```
   sudo defaults write /Library/Preferences/com.apple.RemoteDesktop AdminConsoleAllowsRemoteControl -bool true
   sudo '/System/Library/CoreServices/ARD Agent.app/Contents/Resources/kickstart' -restart -agent
   ```

4. With Remote Desktop running on computer B, try to control from computer A again (and verify that it works).

Mac OS X 10.3, 10.4: Configuring AFP to use OpenSSH exclusively

This article has been archived and is no longer updated by Apple.

Learn how to configure an AFP (Apple File sharing Protocol) client to exclusively use OpenSSH as the connection method, instead of a clear connection. This is an advanced document for Mac OS X 10.3 and 10.4.

AFP includes a feature to use OpenSSH as the data transport mechanism. To prevent OpenSSH from using a clear connection, these three preferences must be set by editing a configuration file (com.apple.AppleShareClientCore):

`afp_ssh_allow=1`
Enables the feature and instructs the client to try OpenSSH if the server advertises it

`afp_ssh_force=1`
Instructs the client to use OpenSSH even if the server does not say it is available

`afp_ssh_require=1`
Causes the login attempt to fail if OpenSSH cannot automatically connect

Important: This settings must be made for each user account. They cannot be made globally.

Note: When these settings are in effect, if OpenSSH cannot establish a connection a "bad password" dialog box appears. The most common cause of OpenSSH failure is when the host key for the server is unknown or is changed. Administrators should distribute and maintain the /etc/ssh_known_hosts files in accordance with best security practices. Without the /etc/ssh_known_hosts file, users will need to manage their own known_hosts file and pre-establish the correct server key.

Editing the configuration file

There are two ways to do this:

Manually edit the file

Open the .GlobalPreferences.plist (which is in each user's ~/Library/Preferences/ folder) in a editor such as TextEdit. Change the three preferences described above.

Repeat this process for each additional account's .GlobalPreferences file.

Make a script

The following script can be saved into a file and run once for every account that will be using AFP over SSH. Follow these steps:

1. Create a new document in TextEdit.
2. Copy and Paste in the text that is in the section below, beneath "Begin copying below this line"
3. Choose **Make Plain Text** from the **Format** menu.

   Tip: If this command is not present in the Format menu, skip this step (as you have already set plain text as the default format).

4. Save this file to the /Users/Shared folder with the name "SecureAFP.command"

   Note: Do not append the txt filename extension to the file.

5. Open the Terminal application (located in the Utilities folder).
6. Type: `sudo chmod 555 SecureAFP.command`
7. Press Return.
8. Enter your administrator password when prompted.
9. Run the script by double-clicking it in the Finder.
10. Log in with a different account, and use the same script.
11. Repeat for other accounts as needed.

Begin copying below this line:

_____

```
#!/usr/bin/perl
$ENV{PATH}="/bin:/sbin:/usr/bin:/usr/sbin";
$defs = `defaults read -g com.apple.AppleShareClientCore`;
$defs =~ s/"afp_ssh_(allow|force|require)"\\s+=\\s+[^;]+;/"afp_ssh_\\1" = 1;/gs;
system qw(defaults write -g com.apple.AppleShareClientCore), $defs;
#end of script
```

_____

End copying above this line.

Note that the script's lines begin, respectively, with "#!", "$ENV", "$defs", "$defs", "system", and "#end"

Additional information

OpenSSH requires access to a user's home directory, so you can't use this method to mount the user's home directory.

AFP connections initiated by the automounter cannot use OpenSSH.

When using OpenSSH the AFP client will not attempt automatic reconnect.

Since OpenSSH only works over TCP/IP, you cannot use this method to communicate to a server over AppleTalk.

Workgroup Manager: Authenticating as a network domain administrator

Workgroup Manager's normal authentication dialog is for server administrator authentication, but you can authenticate as a network domain administrator.

This article has been archived and is no longer updated by Apple.

Important: The system that Workgroup Manager is running on must be bound to the directory domain to be administered.

Follow these steps:

1. Open Workgroup Manager. The authentication dialog box appears.
2. Click the Cancel button.
3. From the **Server** menu, choose **View Directories**. This displays the same kind of window that a server administrator sees.

   Note: The View Directories feature uses the Directory Access settings to find the directories to view.

4. Select the directory node to be administered from the pop-up menu below the toolbar.
5. Click the lock icon to authenticate as the network domain administrator.

Additional information

Domain administrators cannot edit share points, so the Sharing button is dimmed ("grayed out").

Mac OS X Server 10.3: Managed Client - iPhoto, Image Capture can‘t find a connected camera

Learn what to do if iPhoto or Image Capture can't seem to find (or import from) a camera when you manage access to applications with Mac OS X Server 10.3's Workgroup manager.
This article has been archived and is no longer updated by Apple.
This can happen when managing access to applications with Workgroup Manager. Don't worry. A few easy steps will take care of this:

1. Open Workgroup Manager (/Applications/Server).
2. Select the user account, group, or computer list you wish to edit.
3. Click Preferences, then Applications.
4. Allow all of the items in /System/Library/Image Capture/Devices/.

5. Enable the "Allow approved applications to launch nonapproved applications" option.
6. Enable the "Allow UNIX tools to run" option.

The account you selected in step 2 above should now be able to use iPhoto or Image Capture to import photos from the camera. Repeat the steps for other accounts, if needed.

Power Mac G5: System stops responding

Some Power Mac G5 computers using Mac OS X 10.3 may unexpectedly become unresponsive. For example, the Force Quit dialog box might not appear when you press the Option-Command-Escape keys, and mouse clicks might be ignored.
This article has been archived and is no longer updated by Apple.
Many different things could cause an application or the system to become unresponsive, but if you're using a Power Mac G5 with Mac OS X 10.3, you should try the steps presented in this article before spending time on more generalized troubleshooting procedures.

This document addresses a known issue that might cause one or more of these symptoms:

- You can move the pointer, but the system ignores mouse clicks.
- The Force Quit dialog window does not appear when you press Option-Command-Escape.
- The computer can only be turned off by holding the power button or by disconnecting the power cable.

This can happen with any Power Mac G5 that's using Mac OS X 10.3 or later, *except* Power Mac G5 (June 2004) 2.5 GHz or Power Mac G5 (Late 2004) computers.

Important: If you see a specific application unexpectedly quitting or a kernel panic issue, this document does not apply. See this instead for troubleshooting tips.

Solution

Download and install Mac OS X Update 10.3.6. This update improves general system reliability and addresses these specific symptoms.

Important: If you previously disabled Quartz Extreme while troubleshooting with AppleCare, use these steps to re-enable Quartz Extreme. You can use them before or after installing the update.

a. Open /Applications/Utilities/Terminal.
b. Type, on one line:
```
defaults delete /Library/Preferences/com.apple.windowserver GLCompositor
```
c. Press Return.
d. Restart the computer.

About the Mac OS X 10.3.4 Update

This software updates Mac OS X 10.3.3 to version 10.3.4.
This article has been archived and is no longer updated by Apple.
Important: Read Before Installing

1. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.
2. To update to Mac OS X 10.3.4, enter an administrator account password. The password cannot contain a space or special characters typed by pressing the Option key. You can change the password in Accounts preferences if you need to.
3. The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.

Installation

There are two ways to update to Mac OS X 10.3.4: Software Update and Standalone Installer.

Software Update Installation

You may have been referred to this document by Software Update (as described in "Mac OS X: How to Update Your Software"). After reviewing the information here, use Software Update to download and install the update.

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

An installer is also available from Apple Downloads.

Mac OS X 10.3.4 Update updates Mac OS X 10.3.3 to the later version. This document describes how to use this installer.

This update can be installed on nonstartup volumes if you start from a Mac OS X 10.3.4 or 10.3.3 volume first.

Enhancements

These are some of the enhancements included with the Mac OS X 10.3.4 Update.

Mail and Address Book

- Addresses a Mail issue in which a long address (URL) in a Mac OS X Panther Mail message may not open in your Web browser when you click it. More...
- Resolves an issue in which a third-party "Times RO" font could cause Mail, Safari, or other applications to unexpectedly quit. More...
- Address Book can now import more than one email address per contact from an LDIF export file.
- You can now send SMS messages longer than 68 characters via the Mac OS X 10.3 (Swedish) Address Book. More...
- A Mail message will now retain its status (read or unread, flagged or not flagged, and so forth) when you copy and paste it within Mail.
- Attached .zip files can now be saved from Mail without automatically being decompressed.

Networking and .Mac

- Resolves an issue in which automated (scheduled) syncing between iSync and .Mac would sometimes not work as expected.
- Improves function when connecting to a TLS-authenticated wireless network; addresses a "error -1001" issue that could occur when more than one client certificate is stored in a keychain.
- Addresses an issue that could prevent you from using VPN over a PPTP connection.
- Addresses an issue in which, in some cases after a scheduled backup was missed, the .Mac Backup application opened twice.

iPod and peripheral devices

- iTunes and iSync now recognize an iPod connected via USB 2.0.
- Improves compatibility with mass storage devices, SCSI or RAID PCI cards, and USB and FireWire devices, when using Mac OS X 10.3.3.More...
- Addresses a kernel panic that may occur when capturing from some Canon cameras in ESP mode.
- Addresses a situation in which video frames may be missed when digital video is being captured from a FireWire camera connected to a PowerBook.
- Windows for incoming phone calls and SMS messages for a paired Bluetooth phone now appear in the foreground.

Finder

- Addresses an issue in which a writable disc might not appear in the Finder after you burn it. More...
- Improves reliability when selecting several files at a time in Finder at the same time Finder is previewing a movie or MP3 file.
- You can now use more kinds of disk image volumes when the Mac OS X Panther language is set to Devanagari (Hindi, Marati, Nepali, or Sanskrit language), Gujarati, or Gurmukhi (Panjabi).
- Addresses an issue in which some screen captures (or grabs) could unexpectedly contain a gray area.

Printing and faxing

- With this update, you can now print shadowed text from Preview to HP DeskJet 970 or 990 printer without a black outline appearing around the text.
- A PDF file's shadowed graphics will now print as expected with a PostScript printer.
- Improves function when receiving a multiple-page fax.

Other

- Includes recent Mac OS X Security Updates. (This update does not include Security Update 2004-05-24.)
- Improves compatibility when receiving an email with a very large PDF file attached in Microsoft Entourage .
- Preview will no longer ask for a password when opening a PDF file that hasn't been password-protected. More...
- Stickies no longer writes to the hard drive every five minutes, even when the computer is idle.
- Addresses an issue in which scheduled items, such as automated backups or Software Update checks, may not work if the computer is asleep at the scheduled time. With this update, the schedule will run once the computer wakes from sleep.
- Resolves an issue in which an eMac's display resolution could be unexpectedly large and its geometry is off-center (only the upper left portion appears), after waking from sleep.
- Addresses an issue that could prevent an update from installing if some .plist files (ones related to an application that would be installed) were damaged.
- Safari is now able to download a Hotmail email attachment. More...
- Addresses a DVD Player issue in which an "Operation not permitted {symbol like a 0}" alert could appear, and the player could unexpectedly quit.
- Resolves an issue that could prevent users with network home directories from adding fonts to a Font Book collections.
- Improves OpenGL by adding support for OpenGL Vertex Buffer and Replaceable OpenGL entry points.

About the Mac OS X 10.3.4 Update (Combo)

This software updates Mac OS X 10.3, 10.3.1, 10.3.2, or 10.3.3 to version 10.3.4.
This article has been archived and is no longer updated by Apple.
Important: Read Before Installing

1. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.
2. To update to Mac OS X 10.3.4, enter an administrator account password. The password cannot contain a space or special characters typed by pressing the Option key. You can change the password in Accounts preferences if you need to.
3. The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.

Installation

There are two ways to update to Mac OS X 10.3.4: Software Update and Standalone Installer.

Software Update Installation

You may have been referred to this document by Software Update (as described in "Mac OS X: How to Update Your Software"). After reviewing information here, use Software Update to download and install the update.

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

An installer is also available from Apple Downloads.

Mac OS X 10.3.4 Update updates Mac OS X 10.3, 10.3.1, 10.3.2, or 10.3.3 to the later version. This document describes how to use this installer.

This update can be installed on nonstartup volumes if you start from a Mac OS X 10.3.4 or 10.3.3 volume first.

Enhancements

For a list of some of the enhancements that are part of Mac OS X 10.3.4 Update, see About the Mac OS X 10.3.4 Update.

This update also includes enhancements delivered with:
Mac OS X 10.3.3 Update
Mac OS X 10.3.2 Update
Mac OS X 10.3.1 Update

iSync syncs with Sony Ericsson phones via Bluetooth

A Sony Ericsson phone might be able to connect to your Mac via a USB cable and cradle as well as via Bluetooth, but iSync only works with a Bluetooth connection.
This article has been archived and is no longer updated by Apple.
iSync will not see or work with these phones over USB: Sony Ericsson P800 and P900B. Use a Bluetooth connection instead.

Published Date: Feb 19, 2012

Mac OS X 10.3.5 through 10.3.9: Disk images and blank CD-R, CD-RW media, "-536870208" alert in Finder

This article has been archived and is no longer updated by Apple.

You put a blank CD-R or CD-RW disc in your computer or attempt to mount a disk image, but the Finder doesn't mount it. Instead, a "-536870208" alert appears. This can happen after updating to Mac OS X 10.3.5 through 10.3.9.

Solution

1. Log in as an administrator.
2. In the Finder, delete these files:
    - /System/Library/Extensions.mkext
    - /System/Library/Extensions.kextcache
    - /System/Library/Caches/com.apple.kernelcaches
3. Open Terminal (/Applications/Utilities/Terminal)
4. Type this, followed by Return:
   ```
   sudo touch /System/Library/Extensions
   ```
5. Restart.

Handling "overlapped extent allocation" errors reported by Disk Utility or fsck

This article has been archived and is no longer updated by Apple.

If Disk Utility or the fsck command line utility reports "overlapped extent allocation" errors that it cannot repair, here are some things you can do to resolve the issue. This affects both Mac OS X and Mac OS X Server. (This article offers advanced solutions that use the command line interface.)

About overlapped extent allocation errors

Overlapped extent allocation means that two files occupy the same space on your hard disk. Although this is a very rare situation, at least one of the affected files will likely have data loss. If Disk Utility or fsck reports this issue on your Mac OS X volume, do not install any additional software, but do try the solutions presented below.

Important: If you see an overlapped extent allocation error in Disk Utility or fsck, some data loss has already occurred on the disk. This article does not show how to recover lost data, but does provide steps on how to recover from this underlying issue. If you don't have a backup available and important information has potentially been lost, consider contacting a third-party data recovery service *instead of* attempting any of the steps below.

Backup, erase the volume, reinstall Mac OS X

The most effective way to resolve this issue is to back up as much important data as possible, start up from any Mac OS X Install or Restore disc, then perform an Erase and Install installation of Mac OS X (if this isn't an ideal solution for you, try the other options presented in this article).

Once you've reinstalled Mac OS X, restore or replace files from your recent backup (archive).

Tip: Making regular backups is a great way to prevent data loss.

Use Mac OS X 10.4.2 Disk Utility, or fsck, from a volume or disc

With Mac OS X 10.4.2 or later, Disk Utility can help you recover from these issues without erasing the volume. If your startup volume is affected, start up from a Mac OS X 10.4.2 or later disc or other 10.4.2 or later volume, and use Disk Utility to repair the affected volume (you can't use Disk Utility to repair while started from the affected volume).

Note: Only Mac OS Extended or Mac OS Extended (Journaled) volumes (also known as HFS Plus volumes, HFS Plus, HFS Plus Journaled, or HFSP Plus Case Sensitive) can be repaired this way.

If you don't have access to another Mac OS X 10.4.2 or later volume or Install disc ("version 10.4.2" or later appears on the disc's label), start up your computer in single-user mode and use fsck to repair the issues.

If you use Disk Utility on a Mac OS X 10.4.2 or later Install disc or fsck to repair the affected volume, you may be able to review some affected files using the "DamagedFiles" folder— see "Checking for files," below.

Important: If you do not have a Mac OS X 10.4.2 or later volume or Install disc that you can start up from, do not attempt to install the Mac OS X 10.4.2 Update, or any other software, on the affected volume at this point. Doing so may lead to further data loss. Instead, please use one of the other solutions presented below.

Checking for files--If you use Disk Utility or fsck in Mac OS X 10.4.2 or later to repair overlapped extent allocation issues, the following things happen when you repair an affected volume using one of these utilities:

- The repair utility attempts to move the data of the existing overlapped file (or files) to a new location on your hard disk. This move may succeed or fail without displaying any alert.
- If the move succeeds, the file gets updated to use the new data location. (You can move it again if you wish, of course.)
- If the move doesn't succeed because of a lack of contiguous available space or other reason, the file data is not moved.
- A new folder is created in the root level of your damaged hard disk named "DamagedFiles," which contains a symbolic link (or symlink, which is like an alias) with the name "fileID filename" for each file involved in the overlapping extents issue. Use the link (or links) to locate any affected files. Depending on the file, you can then determine if is still usable or if necessary, replace it with a backup. If the original file is a preference file, it's best to just delete it and recreate preferences from the associated application. Be sure to check the contents of all files listed in the DamagedFiles folder as well as in the output from Disk Utility or fsck. (Sometimes a file is created instead of a symlink; see below for details.)

  Important: The DamagedFiles folder may not always contain symlinks to all the files that were involved in producing the overlapped extents errors. You should write down the text output generated when you run Disk Utility or fsck with the actual symlinks or files in the DamagedFiles folder. You can also try to manually locate any files that were listed in Disk Utility or fsck error messages that don't appear in the DamagedFiles folder.

Note: Any files in the DamagedFiles folder that have a fileID less than 16 are (or were) system files. Instead of a symlink, a plain text file gets created for these. Also, if an affected file's name has more than 255 characters, or the path to the file in the file system is greater than 1024 bytes, a plain text file gets created instead of a symlink—you can locate the original file manually to see if it's still usable. If the original file is a preference file, it's best to just delete it and recreate preferences from the associated application.

Try third-party disk repair software

You may also wish to try third-party disk utility applications, which may offer a resolution.

Use the command line to delete problematic files (advanced)

In some cases, removing the affected files and then recreating or restoring them from a backup may allow you to resolve the issue more easily, or at least to start up your computer so you can back up important files. Although these steps are typically for Mac OS X 10.4.1 or earlier, they can be used with Mac OS X 10.4.2 or later if other methods did not work.

Important: Follow the steps precisely. Incorrectly entered commands may result in data loss or unusable system software. Some steps involve using the rm command, which deletes files.

Before attempting the following steps, first consider trying the other solutions presented above.

1. Start up in single-user mode and use fsck.
2. Write down the file number for each overlapped extent allocation entry as it appears. For example, if you see this...

   ```
   ** Checking Catalog file.
   ** Overlapped extent allocation (file 5528909d)
   ** Overlapped extent allocation (file 9053642d)
   ```

   ...then write down "5528909" and "9053642" (ignore the trailing "d").

   Note: With Mac OS X 10.4.2 or later, the output appears like this:

   ```
   ** Overlapped extent allocation (file 1234567 /System/Library/Myfile.plist)
   ```

3. Find the path to each of the affected files. If only one or just a few files are listed, list each file path by entering this command for each affected file (where `5528909` is the number that fsck reported):

   ```
   find / -inum 5528909
   ```

4. Type `mount -uw /` (Then press Return)
5. Type `rm` and then a space (but don't press Return yet). The rm command is used to remove files or directories, so it's important that you follow these steps precisely.
6. On the same line, type the path to the affected file you located in step 3.

   Note: If a file's path contains a space (for example, /iTunes/iTunes Music/Random Song.m4a), type a backslash (\) before each space, or put the entire path in quotation marks. For example:

   /iTunes/iTunes\ Music/Random\ Song.m4a

   or

   "/iTunes/iTunes Music/Random Song.m4a**"**

7. Press Return. The file should be removed.
8. Repeat steps 5-7 for each affected file noted in step 2.
9. When finished, type `reboot`
10. Press Return.
11. Start up in single-user mode.
12. Type `fsck -y` (or `fsck -fy` for Mac OS Extended Journaled volumes).

    Important: If you are deleting flies to remove overlapping extents from your file system, it is essential that you perform this step (step 12). You must run fsck after deleting the overlapping files. If you don't, you may see a reoccurence of overlapping extent issues.

13. Press Return.
14. If the overlapped extent allocation errors still appear, repeat these steps.

After following these steps, restore or replace any removed files from a recent backup (or archive) if you have one. For a more thorough recovery from the issue, after backing up important files, perform an erase installation of Mac OS X.

How to fax to multiple recipients in Mac OS X 10.3

Want to send a fax to several recipients? Mac OS X Panther makes it easy. **Note:** This document is about Mac OS X 10.3's built-in fax feature—the suggestions might not apply to third-party fax software.

Note: This document applies to Mac OS X 10.3 through 10.3.9.

This article has been archived and is no longer updated by Apple.

Just put a comma (",") between each recipient's name or phone number in the fax's To: field, like you'd do to send an email to several people.

If the fax isn't supposed to go to multiple recipients, make sure there are no commas in the To: field. This includes contacts whose name contains a comma (such as ", Inc.").

Using a comma to pause dialing

If you need to fax to a number but also need to use commas to pause when dialing that number (you're using a calling card, for example), check out this tip: Put the first part of the phone number, including commas to pause dialing where needed, in the Dialing Prefix field. Put the rest of the phone number in the To field.

If you want to fax to more than one number that requires pausing with a comma, either send the faxes separately or create an Address Book contact entry for each number (with commas in the Address Book entry) then fax to both Address Book contacts, separating them by a comma. If you're using a "temporary" calling card number, sending separate faxes might be easiest.

Mac OS X 10.3: Computer doesn‘t start if Setup Assistant isn‘t completed (Japanese, Chinese, Korean)

Make sure to complete the Setup Assistant process the first time you turn on your computer if you use a Japanese, Chinese, or Korean language input method. Otherwise, your computer might not start up a second time. This document applies to computers which ship with Mac OS X 10.3.2 or 10.3.3.

This article has been archived and is no longer updated by Apple.

If this happens, restore Mac OS X 10.3 Panther using the Restore CDs or DVD that came with your computer.

You can safely shut down or restart after completing the setup process.

This document will be updated as more information becomes available.

Published Date: Oct 7, 2016

Mac OS X: Computer doesn‘t "network" with itself in Classic ("Loopback address")

In the Mac OS X Classic environment, if you can't "network" with your own computer using some addresses, use the Mac's assigned IP address or host name. This document applies to Classic applications using a sharing service, such as Web Sharing.
This article has been archived and is no longer updated by Apple.
For example, you can't connect to services in the Classic environment that use IP address 127.0.0.1, or "localhost" as the server address or host name. (Experienced users call these "loopback addresses," but they can also be thought of as meaning "this computer.")

What do I do?

Just open Network preferences and look at your Mac's assigned IP address or its host name. Use that instead of 127.0.0.1 or "localhost".
Published Date: Feb 17, 2012

Mac OS X 10.3.2 Install CD can‘t be selected or used while started from Mac OS 9

While started from Mac OS 9, the Mac OS X 10.3.2 Install CD can't be selected in the Startup Disk control panel. The Mac OS X Installer can't be used while started from Mac OS 9, either.
This article has been archived and is no longer updated by Apple.

Symptom

While started from a Mac OS 9 volume:

- The Mac OS X 10.3.2 Panther Install disc is dimmed ("grayed out") in the Startup Disk control panel and cannot be selected as the startup volume.
- Trying to use the Mac OS X Installer doesn't work. This alert appears: "Startup disk was unable to select the install CD as the startup disk. -2"

Products affected

- Mac OS X 10.3.2 install CD
- Computers that can start from both Mac OS 9 and Mac OS X 10.3.

Solution

Start up from the CD instead of trying to select it while started from Mac OS 9. Hold the C key during startup. **Tip**: Make sure you're using a keyboard that's connected directly to the computer's USB port (or the built-in keyboard, for portables).

Alternatively, if the computer supports Startup Manager, use it to set the CD as the startup volume.

Note: If an Open Firmware password is set, it can interfere with the startup process. Disable it if necessary.

Restoring from disk images on a different computer with Mac OS X 10.3

With Mac OS X 10.3 Panther and later (client and server), you can use Disk Utility to create and restore from disk image files. Learn about restoring from a disk image that's on a different computer.
This article has been archived and is no longer updated by Apple.
When restoring from an image via a network while started from a Mac OS X 10.3 disc, use the host computer's (or server's) numeric network addresses instead of a text address. For example, 125.32.19.105.

You can find the IP address in Network preferences on the computer that's hosting the image file(s), if it's a Mac OS X-based computer.

Don't use a host name or Bonjour (formerly "Rendezvous") name. If you do, Disk Utility may display this: "(51) an error occurred while copying".

Additional information

If a numeric network address isn't used and the "(51)" alert appears in Disk Utility, the install log also reports:

```
root: bootstrap_look_up(): unknown error code
root: asr couldn't mount source image.
```

The Classic environment is in English after restoring Japanese software on your iBook G4

If the Classic environment is in English instead of Japanese after restoring Mac OS X from your System Software and Restore DVD, call AppleCare Japan for assistance: 0120-27753-5 or 0120-APPLE-5.
This article has been archived and is no longer updated by Apple.
This document applies to Restore DVDs that ship with some iBook G4 (Early 2004) and iBook G4 (14.1-inch Early 2004) computers with Mac OS X 10.3 (Japanese) preinstalled.

Published Date: Oct 7, 2016

Mac OS X 10.3: Software Update "The update could not be verified and expanded" alert

This article has been archived and is no longer updated by Apple.

Note: This document applies to Mac OS X 10.3 through 10.3.9.

An option in Software Update preferences allows you to download important updates in the background. If you open Software Update preferences, click Check Now, and begin downloading an update at the same time, this message appears:

"The update could not be verified and expanded correctly. Make sure you have permission to write to /tmp/####/TemporaryItems/com.apple.SoftwareUpdate, then try again."

(Where ### is the logged in user's user id.)

Follow these steps:

1. Deselect "Download important updates in the background" in Software Update preferences.
2. From the Finder Go menu, choose Home.
3. Double-click the Library folder.
4. Double-click the Caches folder.
5. Look for a folder named "com.apple.SoftwareUpdate", then drag it to the Trash.
6. Empty the Trash.
7. Restart.
8. Log in and test Software Update.

If the error appears again, repair permissions with Disk Utility. After the repair is complete, try Software Update again.

If the issue persists, download standalone updates from Apple Downloads as a workaround.

About Security Update 2004-06-07

Security Update 2004-06-07 increases security when automatically opening an application for the first time.
This article has been archived and is no longer updated by Apple.
An application may be automatically opened two ways: either by opening a document that is associated with the application or by clicking a link (URL) in a webpage or document.

Opening an application manually or automatically

You can manually open an application, such as by clicking its icon in the Dock; or the application may open automatically, such as when you click a link or open a document associated with the application.

For example: You open Safari *manually* if you double-click its icon in the Applications folder or click its icon in the Dock. Safari opens *automatically* if you open a document such as "mypage.html", or click an "http://" link that's in a document.

How does Mac OS X know which application to open automatically?

This is done by association (or "mapping"). Mac OS X associates each major type of document (such as text, pictures, movies, and webpages) and each major type of link (such as "http://") with a particular application. When you open a document or click a link, it automatically opens in the associated application. If you encounter a document or link type that is not associated with an application installed on your computer, Mac OS X asks you to choose which application to open it with. In the example, webpages (.html) and Web links ("http://") are both associated with Safari by default.

Tip: You can change the application associated with a type of document in the Info window. In some cases you can use application preferences, such as the Default Web Browser preference in Safari.

A warning for new applications

When you open an application manually, you are making an explicit choice to do so. But when you open a document, it may not be clear which application will be used. If you click an untrustworthy link, it may try to automatically open a downloaded application designed to cause harm to the system. The feature provided by Security Update 2004-06-07 alerts you if an application that is automatically opening hasn't already been opened, either manually or by consent to this warning dialog:

You can either open the application or cancel the attempt, which is appropriate if you don't recognize or trust the application.

Once an application has been opened, this message will not appear again for that particular application.

Applications included with your computer are considered "trusted" and will not trigger the warning panel.

Mac OS X 10.3: Caller ID for incoming calls isn‘t always displayed

Sometimes your Apple Internal V.92 Modem does not display Caller ID for incoming calls while you're connected to the Internet.
This article has been archived and is no longer updated by Apple.
Tip: In order to be notified of incoming calls while you're online, you must have an Apple V.92 modem and call waiting service from your phone company. Additionally, your Internet service provider (ISP) must support "modem on hold" connections. Contact your phone company and ISP to determine the availability of these features.

This symptom can occur on Macs that have some kinds of internal V.92 modems, specifically a V.92 "Dash" modem with a USB interface. If you don't know what kind of internal modem your computer has, use Apple System Profiler to find out. Click "Modems" in the Hardware section. If Modem Model includes the word "Dash," the Interface Type is USB, and you're using the Apple Internal 56K Modem (V.92) modem script, this document may apply to you.

With this configuration, if "Notify me of incoming calls while connected to the Internet" is selected, specific Caller ID details may not be displayed if someone calls while you're connected to the Internet; that is, the caller's phone number and name may not appear onscreen. Some telephone company equipment, or "switches," that your phone lines may connect to can lead to this situation.

If you have subscribed to caller ID and call waiting ID, you will see the phone number and name, if available, of the person who is calling you.

This document will be updated as more information becomes available.

Published Date: Feb 17, 2012

Mac OS X Mail: "The server rejected the password" alert, even with correct password

Mail might tell you this, even when you're using the correct password:

"The server {server name} rejected the password for user {username}. Please re-enter your password, or cancel."
This article has been archived and is no longer updated by Apple.
This message may appear several times while trying a correct password.

This can happen if the mail server is not available for authentication or cannot be contacted. Click Cancel, then wait a few minutes. After waiting, choose **Go Online** from the **Mailbox** menu, then enter the same password.

If this doesn't help, you may indeed be using the wrong password, or it may have been changed. Check with your Internet service provider about how you can reset it, if necessary.

Mac OS 9: Preventing the automatic opening of downloaded applications

There are three things you can do to help prevent unwanted applications that are downloaded from the Internet from being automatically opened in Mac OS 9:

- Disable automatic processing and decompressing (or "unstuffing") of downloaded files.
- Disable unassociated "Helper Application" assignments. Your Internet settings may also include a number of Helper Application assignments that do not have installed applications associated with them which should be removed.
- Prevent Help Viewer from running scripts.

This article has been archived and is no longer updated by Apple.

Disable automatic processing and decompression of downloaded files

These instructions are for Microsoft's Internet Explorer. You can apply similar concepts to other Mac OS 9 web browsers.

1. Open Internet Explorer.
2. From the **Edit** menu, choose **Preferences**.
3. Choose "Receiving Files -> File Helpers" from the scrolling list on the left side of the window. (You will most likely have to scroll through the list to see this choice. You may also have to click the disclosure triangle for the Receiving Files setting.)

   You should now see something like this:

4. Change every setting in the Applications column so that none are "Post-process with Application". First select the line to change, then click Change. This message appears:

5. If the Handling "How to handle" pop-up menu is set to "Post-Process with Application", change the setting to "Save to File".

6. Click OK to confirm.
7. Repeat these steps for every application.

Disable unassociated Helper Application assignments

Mac OS 9 typically includes some default Helper Application assignments. For increased safety, you can remove these assignments if you have not installed software to use them.

1. Open the Internet control panel.
2. Click the disclosure triangle next to "Edit sets". You should now see this:

3. Click the Advanced tab.
4. In the scrolling list of icons in the left side of the window, click "Helper Apps". You should now see something like this:

5. Select a "Type" that is to be removed, then click Remove. For best security, remove the following list of types if you do not have software installed that uses them:
    - finger
    - netphone
    - tn3270
    - wais
    - whois
    - x-netphone
6. Close the control panel and save the changes.

Prevent Help Viewer from running scripts

You can prevent Help Viewer from running scripts by removing the protocol helper for "help".

Important: Disabling this protocol helper can prevent some legitimate applications from using Help Viewer. This change will also prevent the Help Viewer from automating tasks that open applications.

Follow these steps:

1. Open the Internet control panel.
2. Click the disclosure triangle next to the "Edit sets" label.
3. Click the Advanced tab.
4. In the scrolling list of icons in the left side of the window, click "Helper Apps".

5. Select the "help" type, then click Remove.
6. Close the control panel and save the changes.

About the Mac OS X 10.3.5 Update (Delta)

This software updates Mac OS X 10.3.4 to version 10.3.5. **Tip**: If you have version 10.3, 10.3.1, 10.3.2, or 10.3.3, update with the combo update instead.
This article has been archived and is no longer updated by Apple.
Important: Read Before Installing

- You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.
- The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.

Installation

There are two ways to update to Mac OS X 10.3.5: Software Update or Standalone Installer. You only need to use one of these methods to update.

Automatic Software Update

Software Update, located in System Preferences, is a tool for automatically downloading and installing the latest Apple software. Software Update may have linked you to this document for additional information about the update.

Note: This update's size may vary from computer-to-computer, when installed via Software Update.

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer (Web Update)

Two different standalone installers (or "Web Updates") are available from Apple Downloads: One that updates Mac OS X 10.3.4 to 10.3.5 (the "delta" update, described in this document), and also a combo update installer which can update versions 10.3, 10.3.1, 10.3.2, 10.3.3, and 10.3.4.

Tip: You don't need one of these if you've already updated via Software Update.

Where do you find these? Go to Apple Downloads.

This type of update, particularly the "combo," is useful if you have multiple computers to update and only want to download 10.3.5 once.

Enhancements

These are some of the enhancements included with the Mac OS X 10.3.5 Update.

Bluetooth enhancements

- Bluetooth FIle Exchange now works better with Bluetooth-capable Hewlett-Packard printers.
- Resolves an issue in which an application that's performing an asynchronous Bluetooth operation could quit unexpectedly, if the computer went to sleep before the data transfer was complete and the "Allow Bluetooth devices to wake this computer" preference setting was disabled.
- Addresses an issue in which Bluetooth File Exchange could unexpectedly quit if you tried to copy several files but one or more of them already existed at the target location.

Networking, Internet enhancements

- If you had difficulties connecting to the Internet with a Comcast cable modem and your account uses DHCP configuration (as opposed to PPPoE), then this update can help you connect more easily. If it doesn't, contact Comcast for further assistance. (An example of this issue would be that your computer can't get an IP address when connected to the cable modem, and your Network preferences are set to configure via DHCP.) More...
- Improves the way Safari handles certain kinds of GIFs, including ones that could cause Safari to quit unexpectedly.
- Reintroduces shorter server pathnames; the overall limit remains 89 characters, but now only 24 characters (instead of 39 with Mac OS X 10.3 through 10.3.4) are reserved for the beginning of the pathname. More...
- Addresses an issue in which the Finder could unexpectedly quit when connecting to an AFP server.

Other enhancements

- Image Capture can now import MPEG-4 movies (.MP4) from compatible digital cameras.
- Resolves a potential data loss issue after renaming a Mail mailbox file.
- Addresses an issue for Mac OS X 10.3.4 in which Installer might unexpectedly quit when installing software that has a Japanese name.
- Corrects an issue in which analog speakers connected to a PowerBook or iBook during sleep sometimes didn't produce sound after waking the computer.
- Resolves an issue with Mac OS X 10.3.4 in which the internal microphones of some iBook (Dual USB) computers would not be available to applications or Sound preferences.
- Allows the "Attach" button of Eudora version 6.0 and 6.0.1 to work as expected.
- Improves support for NTFS-formatted volumes.
- Updates the libpng (Portable Network Graphics) component.
- Addresses an issue in which certain Keynote documents would not print all pages.
- Includes recent Security Updates.

About the Mac OS X 10.3.5 Update (Combo)

This software updates Mac OS X 10.3, 10.3.1, 10.3.2, 10.3.3, or 10.3.4 to version 10.3.5. **Tip**: If you are updating from Mac OS X 10.3.4, you can use this smaller update instead.
This article has been archived and is no longer updated by Apple.
Important: Read Before Installing

- You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.
- The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.

Installation

There are two ways to update to Mac OS X 10.3.5: Software Update or Standalone Installer ("Web Update"). You only need to use one of these methods to update.

Automatic Software Update

Software Update, located in System Preferences, is a tool for automatically downloading and installing the latest Apple software. Software Update may have linked you to this document for additional information about the update.

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer ("Web Update")

Two different standalone installers (or "Web Updates") are available from Apple Downloads: One that updates Mac OS X 10.3, 10.3.1, 10.3.2, 10.3.3, and 10.3.4 to 10.3.5 (described in this document), and also a different installer ("delta") which updates version 10.3.4 to 10.3.5.

Standalone installer updates, particularly the "combo," are useful if you have multiple computers to update that are running different versions of Mac OS X 10.3, but you only want to download 10.3.5 once.

Tip: You don't need one of these if you've already updated via Software Update.

Where can you find standalone installers? At Apple Downloads! For example, here.

Enhancements

For a list of some of the enhancements that are part of Mac OS X 10.3.5 Update, see the Enhancements section of About the Mac OS X 10.3.5 Update.

This update also includes enhancements delivered with:
Mac OS X 10.3.4 Update
Mac OS X 10.3.3 Update
Mac OS X 10.3.2 Update
Mac OS X 10.3.1 Update
Published Date: Oct 7, 2016

Power Macintosh G3 (Blue and White): Unable to start from Mac OS X 10.3.2 Install CD by holding "C" key

If your Power Macintosh G3 (Blue and White) computer has a Matshita CR-587 CD-ROM drive, it may not start up from the Mac OS X 10.3.2 Install disc when you hold the C key.
This article has been archived and is no longer updated by Apple.
It may be able to start from other system CDs, but not the Mac OS X 10.3.2 CD.

If you can start from a Mac OS X volume (such as your hard disk), put the Install CD in after you've started up, then click the "Install Mac OS X" icon you see on the CD. You may be prompted to enter an administrator password. The computer will then restart, and should start from the Install disc. This won't work if you can only start from Mac OS 9.

Otherwise, follow these steps.

1. Insert the Mac OS X 10.3.2 Install disc if it isn't in the computer.
2. Restart the computer and hold these keys: Command-Option-O-F . This asks the computer to start in Open Firmware.
   Tip: If you don't start in Open Firmware, try again. Make sure you're using a USB keyboard, and that the keyboard is connected directly to one of the computer's USB ports.
3. type: `boot cd:,\\\\:tbxi`
4. Press Return.

About iSync 1.5‘s "All day event handling" feature with some phones

Learn about the iSync 1.5 (or later) "Sync all day events" feature, which can be used with some phones.
This article has been archived and is no longer updated by Apple.
Certain phones, including the Sony Ericsson T68, T616, and the Siemens S56, work with a special iSync option, "All day event syncing."

This option is off by default, but you can turn it on by clicking the Options button at the bottom of the iSync device drawer. If the Options button is not present, your phone doesn't work with this iSync feature.

What happens after "Sync all day events" is enabled in iSync?

Once the option is enabled, iSync will sync iCal calendars to the phone as read-only entries. All day events should only be changed or modified *on the Mac* and then synced to the phone. If the entries (calendars) are modified on the phone, iSync will display an alert during synchronization which explains that the calendar is read-only and that any calendar changes made on the phone will be lost.

What if the phone's time zone changes?

Changing the phone's time zone will not affect the event. Rather, it simply adjusts the event for the new time zone. This does not modify the event or cause any iSync alerts during synchronization.

What happens if "Sync all day events" is disabled in iSync?

Any "All day events" on the phone will be removed during the next sync. This does not affect the events in iCal. You can get the events back on the phone by turning the option on again and syncing.
Published Date: Feb 19, 2012

iSync 1.5: No iSync transfer option in Bluetooth Setup Assistant

This article has been archived and is no longer updated by Apple.

Sony Ericsson P800 and P900 phones work with iSync 1.5 via Bluetooth, but Bluetooth Setup Assistant might not offer an iSync transfer option for them when setting up devices. This can happen if the phone's firmware has been updated.

If a phone is supported by iSync, the Bluetooth Setup Assistant option to "Set up iSync to transfer contacts and events" is normally one of the available options. However, when adding a Sony Ericsson P800 or P900 series phone using the Bluetooth Setup Assistant, the option to "Set up iSync to transfer contacts and events" may not be available.

Why does this happen?

Some firmware updates to these phones change the identification information the phone sends to the computer during the pairing process. Because the Bluetooth Setup Assistant does not recognize the later ID of the phone, it does not offer this iSync option.

Important: This issue only affects the Bluetooth Setup Assistant and does not affect the ability to use the phone with iSync.

What can I do?

You can use these steps as a workaround:

1. Continue with the Bluetooth Setup Assistant even if the option doesn't appear.
2. Once the Bluetooth Setup is complete, open iSync.
3. From the **Devices** menu, choose **Add Device**.
4. Double-click the name of the phone to add it to iSync.

Minimizing how often you see "Optimizing System Performance" during software installation

This article has been archived and is no longer updated by Apple.

Have you ever wanted to optimize system performance just once, instead of waiting through it for each software update that requires it?

Mac OS X (10.3, 10.4 or later) includes a feature to do exactly that. Following the steps here, you can optimize just once when installing multiple updates that would each trigger optimization if installed separately. This trick is especially helpful when there's a group of software updates that you plan to install on several computers.

You can benefit with either of these ways of installing software in Mac OS X:

- Software Update, located in System Preferences
- Manual installations from a standalone "package file" (.pkg), which may look like this:

The Installer application handles manual installations, and it opens automatically when you double-click an installation package file. Software Update installs in a different manner and doesn't use the Installer application.

Software Update

Using Software Update preferences, simply install more than one update at a time (when more than one is offered, of course). Software Update in Mac OS X 10.3 automatically optimizes only what is necessary, ensuring the updates are installed as quickly as possible. Previously, you might have had to sit through optimization for each and every update, even if you installed many at once. With Mac OS X Panther, such delays when installing multiple items are but a fond memory.

Standalone package installation files

Simply open more than one installation package file at the same time. The Installer application will queue up the packages and install them in order. This even works with third-party package files that use Installer. After the last package is installed, Installer performs optimization on the computer, but usually just one time. Beats optimizing after each package, doesn't it?

Tip: Even if Installer is already chugging away at some cool software for you (or even uncool software, Installer doesn't care), you can double-click *even more* package files and Installer will add them to the same queue. Installer still won't optimize until after the very last package is installed, and then just once.

What about other kinds of software installations?

This feature doesn't apply to third-party installer applications that don't use Software Update or the Mac OS X Installer. Typically such installers run only once, are for very large applications, and are on removable media (CDs, DVDs, and so forth). Such installers might entertain you with screenshots of the software in action, or tips about how to get the most out of the product, while installing and optimizing in the background.

What is an operating system (OS)?

This article has been archived and is no longer updated by Apple.

Ever wonder what an "operating system" is? This concept is easier to understand than you may think.

The operating system

Imagine going to the symphony only to see the musicians sit quietly without sheet music or a conductor. That's like what your computer would do without an operating system, or "OS" -- it would turn on and do nothing useful. That's why all Macintosh computers come with a version of the "Mac OS" preinstalled. At the concept level, an OS is simply the software that controls your computer and tells it what to do. Your computer must have an OS installed before it can do anything useful or fun.

The current version of Mac OS is Mac OS X (pronounced "Mac O-S ten"). Earlier versions of Mac OS included Mac OS 9, Mac OS 8, System 7.5, and System 6. Major releases of Mac OS X include versions 10.0, 10.3, and 10.4. There are also updates (sometimes called "dot" releases) for each major release, such as versions 10.2.8 and 10.4.2. If you don't have Mac OS X and want to get it, be sure your computer can work with it, then visit this website for more information about upgrading.

Tip: Want to see what version of Mac OS you have? From the Apple menu (in the top-left corner of the screen), choose About This Mac.

Tip: An operating system includes thousands of files, many of which are protected so you can't accidentally remove them. The System folder in Mac OS X is an example. Each Macintosh comes with a backup copy of the Mac OS on system software CD or DVD.

An integral part of the Mac OS operating system is the Finder. To learn more about it, see "What is the Finder?"
Published Date: Oct 7, 2016

What is the Finder?

Learn about one of the best parts of the Mac OS, the Finder.

This article has been archived and is no longer updated by Apple.

Before Apple reinvented the personal computer with Macintosh in 1984, finding something on a computer could be kind of scary. There were often no nice, neat folders. Getting to your files and applications could have meant typing out long pathnames in a cryptic text-only environment.

The Finder saves you from that. It's the integral part of the Mac OS that shows you easy-to-read folders and windows instead of all those old-fashioned text prompts. The Finder lets you visually navigate disks, work on the desktop, and open applications and files. It can show you information about your files and folders, such as their size and date modified, even allowing you to sort by those categories. The Finder also lets you move or delete files, eject discs and perform searches on your hard disk.

Each release of Mac OS makes the Finder more helpful and versatile. Read more about the Mac OS X Finder here.

Viewing PDF documents in Mac OS X with Preview

This article has been archived and is no longer updated by Apple.
Many Apple products include manuals in Portable Document Format (PDF). You can read these and other PDF documents with Preview.

If you double-click a PDF file and a different application opens, you can use these steps to tell Preview to open PDF documents:

1. Select the PDF file in the Finder.
2. From the **File** menu, choose **Get Info**.
3. In the Info window that appears, click the disclosure triangle next to "Open with."
4. Set the pop-up menu to Preview.
5. Click the Change All button that's immediately below the pop-up menu.

If you like to use shortcut menus (Control-click), you can use the alternate method shown in this movie. To change from "Open with" to "Always open with," as you see in the movie, press the Option key.

Mac OS X 10.3.5 Some fonts aren‘t available

After updating to Mac OS X 10.3.5, some fonts that you're used to using may no longer be available, or may only show up in some applications. This is most likely to affect Expert fonts, Dingbats fonts, or fonts with fancy or non-English glyphs (characters). Thankfully, all you have to do is update to Mac OS X 10.3.6 or later to fix this.
This article has been archived and is no longer updated by Apple.
For example, the PostScript Type 1 version of "Zapf Dingbats" may no longer work after updating to Mac OS X 10.3.5 or late.

Note: Existing documents that were created with the font may print it correctly, even if the font does not appear in the document or in font-related menus.

Solution

Update to Mac OS X 10.3.6 or later.
Published Date: Feb 17, 2012

Xserve G5: Moving a PCI Hardware RAID card? Reset its configuration information

Anytime you move a PCI Hardware RAID card from one Xserve G5 server to another, you must reset the card back to JBOD ("Just a Bunch of Disks") mode by removing the configuration information with all hard drives disconnected from server. Otherwise, the server which you put the card in to may not recognize the drive configuration.
This article has been archived and is no longer updated by Apple.
Follow these steps to remove previous configuration information from the PCI Hardware RAID card:

1. Shutdown the Xserve G5 server that has the card installed.
2. Disconnect all hard drives from the server.

   Warning: Data loss can occur if you don't disconnect all drives.

3. Start up the (drive-less) server from the Xserve Server Software CD 1.
4. In Terminal, execute the command: `megaraid -destroyconfig`
5. Shutdown using this command: `shutdown -h now`
6. Reconnect all of the hard drives.
7. Start up normally. The PCI Hardware RAID card should read the metadata from the connected drives.

Published Date: Oct 7, 2016

Mac OS X 10.2: Can‘t update to 10.2.8 after Archive and Install of 10.2

Can't update back to 10.2.8 after an Archive and Install installation of Mac OS X 10.2? Fear not. We'll tell you how to fix that.
This article has been archived and is no longer updated by Apple.
The issue can crop up in a couple of different ways:

- Software Update won't install the Mac OS X 10.2.8 Update. When you try, this alert message appears:

  "The installation has encountered a problem. None of the checked updates were successfully installed. To try again, choose Download Checked Items in the Update menu and open the package from the desktop."

  What a downer!

- The standalone Installer from Apple Downloads doesn't work either. It tells you:

  "There were errors installing the software. Please try installing again."

  (Even if you dutifully try again, you do not succeed.)

- If you're the adventuresome type who reads Console log, you might see something like this:

  ```
  Software Updates {405} *** NSTimer ignoring exception 'NSRangeException' (reason '*** -{NSCFArray objectAtIndex:}: index (0) beyond bounds (0)') that raised during posting of timer with target 1ba0e50 and selector 'taskCompleted:'
  ```

  Tip: Don't worry about what all that means.

Solution

1. Get a different 10.2 update from Apple Downloads, such as the Mac OS X 10.2.6 Update. **Note:** 10.2.7 is not available.
2. Install the update, and restart when installation is complete.
3. Now you can update to 10.2.8 using either Software Update or Apple Downloads.

If everything installs, you're all done!

"Disk Copy Helper has unexpectedly terminated" message

If you see that, you're not *quite* done yet. You could see this when trying to open the downloaded disk image file (.dmg), for example. To fix this:

1. Open the Utilities folder, which is in the Applications folder.
2. Adjust the Utilities folder window so that you can see Disk Copy.
3. Drag the image file (.dmg) on top of Disk Copy. The mounted image should then appear alongside other available disks, like your hard disk, and you should be able to use package file (.pkg) on it to update your software.

Tip: If the installation package file (.pkg) won't open either, drag it directly onto the Installer, which is also in the Utilities folder.

iBook G4 has a color tint after using Screen Saver

After updating to Mac OS X 10.3.4 or later, the display's color balance may change with Screen Saver use. It may have a light blue tint, for example. This happens only with the iBook G4 and iBook G4 (Early 2004) models, regardless of whether Screen Saver was manually or automatically engaged.

This article has been archived and is no longer updated by Apple.

What can you do when this happens? Open Displays preferences, click Color, then click on the name of your desired color profile (even if it's already selected).

If this keeps happening but you don't want to keep resetting the color profile, set the "Start screen saver" slider to Never in Desktop & Screen Saver preferences. Consider using Energy Saver's display sleep feature instead.

This document will be updated as more information becomes available.

About LaserWriter 8 Version 8.4.3 Read Me

LaserWriter 8 Version 8.4.3 was released on July 24, 1997 and has been posted to Apple Software Updates libraries on the WWW and other platforms. It requires System 7.1.1 or later and a 68030-based Macintosh. Mac OS 8.0 or later running on a 68040- or PowerPC-based Macintosh is recommended. Description: This software is included as part of Mac OS 8.0.

This software consists of a Disk Copy NDIF (New Disk Image Format) compressed image, which requires Disk Copy 6.1 or later to use. Download this software to your hard drive and then double-click it to use it. Disk Copy is available in the Utilities folder.

This article has been archived and is no longer updated by Apple.

About LaserWriter 8 Version 8.4.3

This document contains some important information about LaserWriter 8 version 8.4.3. You may want to print this document and keep it for future reference. The topics are:

- What's New in LaserWriter 8 Version 8.4.3
- Installing LaserWriter 8 Version 8.4.3
- Using LaserWriter 8 Version 8.4.3

What's New in LaserWriter 8 Version 8.4.3

- Support for QuickDraw GX Applications

QuickDraw GX applications - LaserWriter 8 version 8.4.3 supports GX applications which have been revised to work with the Classic Print Manager. Check your application documentation to see if your application requires GX print drivers.

- About Extra Blank Pages with PageMaker

PageMaker documents have an extra blank page when printed with LaserWriter 8.4.1. LaserWriter 8 version 8.4.3 corrects this.

- About International Systems Using Right To Left Line Direction

LaserWriter 8 version 8.4.3 corrects a tabbing issue in the Chooser on these systems.

Installing LaserWriter 8 Version 8.4.3

After decompressing the LaserWriter 8 version 8.4.3 archive follow the steps below to install the files.

- Restart your system with all extensions turned off. To do this, hold down the Shift key while you restart your computer. Hold the Shift key down until you see the message "Extensions off" or until your normal desktop appears.
- Rename your existing LaserWriter 8 driver or drag it to a folder outside the System folder.
- In System Folder: Preferences delete the files LaserWriter 8 Prefs, LaserWriter 8.4 Prefs, and LaserWriter 8.0 Prefs if found.
- Drag all Desktop Printer icons to the Trash and empty the Trash. You will need to recreate your Desktop Printers. Be sure to print all current spool files before doing this step.

Next, drag the files listed below to your system. Follow these steps:

- Place LaserWriter 8 in System Folder: Extensions.
- Place PrintingLib in System Folder: Extensions.
- LaserWriter 8 version 8.4.3 requires PrintMonitor 7.1.2 or greater.
- If you are using a 68K-based Mac OS system, LaserWriter 8 requires these files in the System Folder:Extensions folder:

- CFM-68K Runtime Enabler version 4.0 or greater
- NuQuickTimeLib.slb version 2.0.1 or greater
- NuThreadsLib.slb version 2.1.1 or greater

If you are using Mac OS 7.1.1 and have a version of Chooser earlier than 7.3, place Chooser 7.3 in your System Folder:Apple Menu Items

- Reboot your system with extensions on. You should be able to setup your printer using Chooser and be able to print to it.

Using LaserWriter 8 Version 8.4.3

Using PostScript Fax

PostScript Fax is an option for the LaserWriter Select 360, the LaserWriter 16/600 PS, and the LaserWriter Pro 810. If you use a PostScript Fax

option with any of these printers, you should use LaserWriter 8f version 8.2.3f. PostScript Fax is no longer supported with LaserWriter drivers 8.3 and beyond. See the section "How To Get Updated Printer Software"at the end of this Read Me for information on obtaining LaserWriter 8f version 8.2.3f if you don't already have it.

Using Color Matching

When ColorSync 2.0 or greater is installed and the ColorSync Profiles folder contains printer profile(s), there are two options in addition to color/grayscale output:

- PostScript Color Matching/Printer's Default is the preferred color-matching choice. When you are printing to a PostScript Level 2 printer, and it is efficient to let the printer do most of the work, this option is a good choice.
- ColorSync Color Matching is an alternative color-matching selection. It invokes the ColorSync system software to perform color matching for the printed document, matching your monitor and printer's profile and sending the correct color information to the printer. With ColorSync Color Matching, most of the work is done by your Macintosh.

Here are some tips on using color matching:

- Color output will vary depending on the application you are using.
- Documents that use ColorSync 1.0 embedded profiles convert to the profile set up in the ColorSync 2.0 System Profile control panel.
- When you print with PostScript Color Matching selected and ColorSync 2.0 is not installed, the driver uses the Apple 13" RGB Standard profile.
- Application programs that generate their own PostScript may have issues color matching EPS or TIFF images correctly. Converting the image to a PICT file corrects the issue.

PPD Files

The LaserWriter 8 driver uses PostScript Printer Description (PPD) files to determine the characteristics of the printers it uses. PPD files contain information about individual PostScript printers. For example, PPD files describe the paper-handling capabilities of printers: the number of paper trays, their capacity, and the paper sizes they handle.

To take full advantage of your printer's features, you need to go through a simple setup procedure. When selecting your printer for the first time, or after installing an additional option, click the Create/Setup button in the DTP Utility or in the Chooser . This procedure causes the LaserWriter driver to query the printer for its characteristics and associate a particular PPD file with the printer.

You can also change your printer's setup by highlighting your desktop printer icon and then selecting Change Setup from the Printing Menu.

If you get an error about the preferences file when you choose an option that is specific to your printer, you may have an outdated PPD file. You should contact the vendor of your printer for an update.

Using English Language Chooser 7.3 on Localized Mac OS Systems

If you use Chooser to select your printer, be sure to use Chooser 7.3 or greater because LaserWriter 8 requires Chooser 7.3 or greater. If you have a localized Mac OS system with a Chooser earlier than version 7.3 and you install an English-language version of the printer software, an English-language Chooser 7.3 may be installed. Use Chooser 7.3 or greater to select the printer to which you want to print.

Creating EPS Files

You can create an encapsulated PostScript (EPS) file in many application programs by clicking File in the Print dialog box, then clicking Save. When you create an EPS file, note the following:

- Creating EPS files with the All option selected in the Font Inclusion pop-up menu in the EPS dialog box can result in very large files. If you include all fonts in an EPS file and save the file with the Unlimited Downloadable Fonts option selected, you may create an extremely large file.
- If you create an EPS file with no fonts included and open the document, fonts in the document appear on your screen, but Courier may be substituted when you print.
- When you create EPS files with preview information included, other programs that create their own PostScript code may not display the EPS file accurately on the screen.

Using the LaserWriter 8 Driver With the Kanji System

To print Japanese characters using KanjiTalk or the Japanese Language Kit, your system must have WorldScript II version 7.5.1 or later.

Using QuickDraw GX Fonts on a non-QuickDraw GX System

If you are using the QuickDraw GX versions of the fonts Hoefler or Skia with a non-QuickDraw GX system, you may encounter line-layout issues on screen or with your print-outs. To correct this issue, remove the GX fonts from your Fonts folder.

Using the LaserWriter 8 Driver With Applications

Some programs do not yet take advantage of the new features of the LaserWriter 8 driver or have small incompatibilities that result in printing issues. If you experience issues with an application, please contact the publisher of the program. In some cases a newer version of the program may be available.

The following list describes some special cases that you should be aware of when working with some applications. There may be other issues with these, or with other programs, not mentioned in this document.

Foreground vs Background Printing: LaserWriter 8.4 and greater offer both foreground and background printing.
In foreground, the driver doesn't spool the file being printed. An application may fail when printing in the foreground if the application assumes the driver will make a spool file.

If you experience issues with foreground printing, change to background printing and try again.

- With many programs, you cannot use the Flip Horizontal, Flip Vertical, landscape page orientation, and Layout option in the Page Setup dialog box in combination.
- Some programs may print in color even when Black and White mode is selected.
- Programs that generate their own PostScript may have issues color matching EPS or TIFF images correctly. Converting the image to a PICT corrects the issue.
- Tray Selection: Applications that don't utilize LaserWriter 8's capabilities have some limitations with tray selection when printing from the Finder. To work around these issues, print from within the application and contact the vendor of this application.

****

Adobe Acrobat 3.0

- Acrobat retains the settings used for one printout and applies these settings to subsequent print jobs, unless options are reset by the user.
- The orientation of the .PDF file may not match the setting that appear in the printer dialogs. This is expected behavior.

The .PDF file will print as it is displayed on your monitor.

Adobe Illustrator 6.0.1

- Multiple-page documents may not print correctly when you choose a page layout from the Layout pop-up menu in the Page Setup dialog box.

Adobe PageMaker 6.5

- Documents that have been set up using a page layout from the Layout pop-up menu may not print correctly with the Print-Option command. Use the Print command with PageMaker's Thumbnail option.
- When using a page layout from the Layout pop-up menu with the Print-Option command, the document will be printed in reverse order.
- Rotated graphics may not print correctly when you hold down the Option key and click Print in the Print dialog box.
- You cannot print legal-size documents from the paper cassette of the Personal LaserWriter 320; print such documents by selecting Manual Feed or by holding down the Option key and clicking Print in the Print dialog box.
- Foreground printing does not always print text in the correct size.

Adobe Persuasion 4.0

- Persuasion uses its page dimensions to establish the orientation. These dimensions, however, are not picked up the driver's orientation settings.

Adobe SuperPaint 3.5

- Rotated or filled polygons print as solid gray objects.
- Gradient fills may not print when copied into other programs.

ClarisDraw 2.0

- Some shapes that contain gradients may not print correctly.
- A PostScript error is sometimes generated when attempting to print in the foreground. If you see this error, print the document again in the

background.

DeltaGraph Pro 4.0

- Printing with Unlimited Downloadable Fonts may cause some elements to be shifted and fonts to substitute Courier.

Informed Designer/Manager 1.4.3

- Do not print documents that contain JPEG images in Black and White mode; your system will restart.
- When you select the Unlimited Downloadable Fonts option, some graphic elements may shift or disappear when printed.

Lotus 1-2-3

- Sometimes a single document prints when multiple documents are sent to printer.

Microsoft Excel 5.0

- When you first install the new printer driver, you need to use the driver's page setup dialog to set the orientation of your document. When you select Page Setup, Excel first displays its own dialog box. Click the Options button to open the Page Setup dialog box generated by the LaserWriter driver. Then click on the orientation setting you desire. Click Okay to exit the driver's dialog. Then click Okay again to exit Excel's dialog.
- Most of the settings in Excel's Page Setup will now match the corresponding options in the driver's Page Setup. However, the scaling size may be different in the two dialog boxes. The size displayed in the Excel window is the size that will be used when you print from Excel.
- Colored horizontal cell borders will often not appear in the printout. This happens with any color printing option and on most printers.
- If in print preview window, multiple copies will not be printed.

MicroSoft Word 6.0.1

- Each section of a document is treated as a separate file when printed. This will not affect your output.
- Also, another section is sometimes inserted in the document when cursor is not at the top of the document.
- A blank page will be produced when incorrect page numbers are given.

Microsoft Works 4.0

- There are 24 new shapes available through the tools palette. Colored shadows for any of these shapes will appear correctly on screen. But these colored shadows will only print in gray, regardless of what the print color options might be.
- Works 4.0 color printouts may not match what appears on your screen. Experiment with the color options to determine which one generates the best printout for your needs.

Netscape 3.0.1

- Netscape may print a pale gray background to an older LaserWriter printer.
- When printing a multiple-page document, Netscape may print below the margins on the intermediate pages.
- Portions of graphics that seem to be transparent on screen will be printed on your documents.

Painter 3.0

When you print using the Invert option, images do not print inverted correctly.

- Painter adds 2 small pop-ups to the print dialog panels. They are in the lower left quadrant of the panels and can interfer with the driver's functionality.

PixelPaint Pro 3.0

- When you print using the Invert option, images do not print inverted correctly.

QuarkXPress 3.32

- Be sure to use the PPDs provided with QuarkXPress when you choose a page layout from the Layout pop-up menu in the Page Setup dialog box.
- Some imported JPEG files may not print correctly.

ReadySetGo! 6.0

- Use ReadySetGo! version 6.0 or later with the LaserWriter 8 printer driver; earlier versions will not work.
- With the Unlimited Downloadable Fonts option selected, you may not be able to print complex documents.
- Documents that use pen patterns will print patterns as solid gray.

Studio/8 & Studio/32

- When creating an EPS file with these programs and the LaserWriter 8 driver, you must select the QuickDraw Printer option.
- A blank page is sometimes printed when a doc is dropped onto a DTP.

Published Date: Feb 20, 2012

PC Setup Version: 1.6.1 Read Me

PC Setup Version: 1.6.1 was released August 15, 1997. This software update requires US System 7.5.3 or later, and a 166 MHz PC Compatibility Card installed in a Power Macintosh 4400 or 7220.

Description:
This software, only for a 166 MHz PC Compatibility Card installed in a Power Macintosh 4400 or 7220, fixes a problem with formatting and writing to DOS floppy disks in PC mode. It also corrects a problem with a generic icon of the PC Setup control panel.
This article has been archived and is no longer updated by Apple.
This version of PC Setup is only supported on the Power Macintosh 4400 or Power Macintosh 7220 with a 166 MHz PC Compatibility Card installed. It has not been qualified for use on other CPUs or PC/DOS Compatibility Cards and is not supported on this hardware.

This software consists of two Disk Copy NDIF (New Disk Image Format) compressed images, which requires Disk Copy 6.1 or later to use. Download this software to your hard drive and then double-click it to use it. Disk Copy is available in the Utilities folder.

Disk Copy 6.1 (or later) or Disk Image Mounter 2.1 (or later) from Apple are the recommended applications to access all disk images released by Apple and are the only supported applications to access NDIF disk images.

Mac OS 8.0 & 8.1: Clean Installation Instructions

This article describes the steps to do a clean installation of a System Folder in Mac OS 8.0 and 8.1 without having to remove the Finder, System file or renaming the System Folder.

For Mac OS 8.5 through 9.2 information, see technical document 58176, "**Mac OS 8.5, Mac OS 9: Performing a Clean Installation**".

This article has been archived and is no longer updated by Apple.

Purpose of a Clean Installation

A normal system software installation modifies and updates the existing System Folder. A clean installation disables the existing System Folder, leaving all files in place, and creates a new System Folder.

A clean system installation brings the system software back to the standard configuration. This is necessary when system software has been damaged or modified, preventing a normal installation. It is also useful in troubleshooting.

Clean Install Instructions

Follow these instructions in the order presented.

Starting from the Mac OS 8 CD

1. Insert the Apple Macintosh CD in the CD-ROM drive.
2. Restart your Macintosh.
3. As soon as you hear the startup chime, hold down the letter 'C' on the keyboard until you see the "Welcome to Macintosh" message.
4. As the computer starts up, you should see the "flying CD" background pattern- this will confirm that you are starting from the CD.
5. If the computer does not start from the CD, shut down the computer, turn on the computer and immediately hold down the Command-Option-Shift and the large Delete key simultaneously. Hold down these keys until you see the "Welcome to Macintosh" message.
6. If you a receive a system error while starting from the CD, please see the section entitled "Cannot Boot from Mac OS 8 CD When AppleTalk is Off" in article 24160: "**Mac OS 8: Late Breaking Information**."
7. At the desktop, the Apple Macintosh CD's icon should be in the upper-right corner of your screen with your hard drive's icon below it. If any other hard drive appear above the Apple Macintosh CD, go to the Control Panels under the Apple Menu, open the Startup Disk item, select the Apple Macintosh CD, close all open windows and restart. The Apple Macintosh CD should then appear above the hard drive.
8. If you have successfully started from the Mac OS 8 CD, double-click the "Mac OS Install" icon or the "Install Mac OS 8.1" icon, then proceed to the section entitled "Installing Mac OS 8".

Starting from the Disk Tools diskette

Note: These steps require a Mac OS 8 CD and Apple CD ROM drive.

1. Shut down your Macintosh computer.
2. Insert the appropriate Disk Tools diskette in the floppy drive, and turn on the computer. At the desktop, the Disk Tools floppy disk's icon should be in the upper-right corner of your screen with your hard drive's icon below it.
3. Disk Tools Disk 1 is designed for use with all non-PowerPC machines except the PowerBook 190.
4. Disk Tools Disk 2 is designed for use with all PowerPC computers and the PowerBook 190.
5. Insert the Mac OS 8 CD and double click the "Mac OS Install" icon or the "Install Mac OS 8.1" icon, then proceed to the section entitled "Install Mac OS 8".

Starting from the Install Me First diskette

1. Shut down your Macintosh computer.

2. Insert the Install Me First diskette in the floppy drive, and turn on the computer. The installer program will launch automatically on startup.

Installing Mac OS 8

1. The "Welcome" screen will come up. Click the Continue button.

2. When the "Select Destination" screen comes up, select the appropriate disk in the Destination Disk pop-up menu.

3. Check the box marked "Perform Clean Installation", then click the Select button.

4. Read the Important Information on the next screen and click Continue.

5. Read the licensing agreement and click Continue.

6. At this point you may customize your installation. Refer to your Mac OS 8 manual for descriptions of the optional components listed.

7. If you are using a non-Apple hard disk, click the Options... button and uncheck the Update Apple Hard Disk Drivers option. It is very important that you check with the vendor of your non-Apple hard disk to confirm that your hard disk driver will be compatible with Mac OS 8 before you start the installation.

8. Click the start button. The installer will check your hard disk and attempt to repair any faults that it finds. If it is unable to repair them, you should back up the hard disk and reinitialize it using the appropriate formatting utility for that drive. For Apple drives, use Drive Setup.

When you are finished with the installation, restart the computer. If you started from the diskette, it will be ejected, however if you started from the CD-ROM you may need to eject the Mac OS 8 CD.

Troubleshooting

These steps assume you are using the Clean Install of system software for troubleshooting purposes.

1) Verify Issue Resolution

2) After performing a clean installation, verify that you resolved the difficulty before adding anything to the new System Folder. Adding items to the System Folder before resolving your difficulty defeats the purpose of performing a clean installation.

3) Install Non-Standard Items

You can now reinstall the non-standard items from the old System Folder (now named "Previous System Folder") such as fonts, extensions, and control panels. If possible, you should reinstall these items from their original disks.

If the original disks are not available, you may move the nonstandard items from the Previous System Folder to the new System Folder. Be careful not to replace anything that is already in the new System Folder. Only move items that are not already in the new System Folder. Open each corresponding folder within the System Folder and the Previous System Folder and then compare the contents. Move up to 5 items that are not already in the new System Folder and its sub folders from the Previous System Folder and its sub folders.

Restart your Macintosh.

Verify that the Macintosh is still starting up properly and that basic functions are working properly.

Repeat Steps 2-4 until all non-standard items have been moved from the Previous System Folder to the new System Folder.

4) Final Steps

Verify your applications are performing normally. If not, refer to the application manual or contact the vendor. When the Macintosh behaves as expected and you are sure that all needed items from the Previous System Folder are transferred or reinstalled, move the Previous System Folder to the Trash, and choose Empty Trash from the Special menu.

Apple Printer Utility 2.2 - Read Me

Apple Printer Utility Version 2.2 was posted on January 30, 1998. It requires US Mac OS 7.1.1 or later.

Description:
This software is included with the LaserWriter 8.5.1 software posted here. It replaces all previous versions of Apple Printer Utility. Contains a 68k-based (non-PowerPC) version of Apple Printer Utility 2.2, and a PowerPC version of Apple Printer Utility 2.2. For complete information, please see the documentation included with the LaserWriter 8.5.1 software.
This article has been archived and is no longer updated by Apple.
Apple Printer Utility Version 2.2

Apple Printer Utility is Now a Custom Install Option only

The Apple Printer Utility is now a custom install option only. If you cannot find the Apple Printer Utility version 2.2 on your system, it probably was not installed.

Printer Support

The Apple Printer Utility program works with all Apple PostScript Level 1, Level 2, and PostScript 3 printers. If this software is used with a non-Apple printer or with a printer developed after this release, a set of generic features will be available. The generic feature set consists of options that are common to most PostScript printers. These features should work with non-Apple printers but are not specifically supported by Apple.

Working with a Large Number of Downloaded Fonts

If you plan on working with a large number of downloaded fonts, you will need to increase the memory allocation for the Apple Printer Utility. To do this, quit the Apple Printer Utility, select its icon and choose Get Info from the File menu. Increase the memory in the Preferred Size box, then close the Get Info window. The amount of memory required grows dynamically as the number of fonts in the printer increase. Increase the Apple Printer Utility's Preferred Size memory by 100K to 500K and try downloading again.

Working with 2-Byte Fonts

Downloading Chinese, Japanese, or Korean fonts is not a supported feature of this software and program errors may occur.

Downloading PostScript Fonts on a QuickDraw GX System With the Apple Printer Utility

When GX is installed, any PostScript fonts (often called Type 1 fonts) in the Fonts folder are converted to GX fonts, and the original PostScript fonts are copied to a new folder called *Archived Type 1 Fonts* which is created in the System Folder. If you want to download these fonts to your printer using the Apple Printer Utility, you must send the fonts in the *Archived Type 1 Fonts* folder, not the GX-converted versions in the Fonts folder. Downloading GX fonts that were not previously Type 1 fonts and converted by GX works correctly.

Apple/GV 56K Modem Updater Read Me

This article comprises the Read Me for the Apple/GV 56K Modem Updater. This software was released by Apple on January 15, 1999 and is available for download from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Requires:

The 56k internal modem which came with the Power Macintosh G3 (Desktop, Minitower, or All-in-one), or Power Macintosh 6500 series computers.

Description:

Includes Apple/GV 56K Updater 2.200 and Apple/GV 56K Updater v1.001. The Apple/GV 56K Updater 2.200 installs the V.90 protocol. If you have updated to the V.90 protocol and discover that your ISP only supports K56flex, run the Apple/GV 56K Updater v1.001 to install the K56flex protocol.

Other Info:

These updaters DO NOT support the modem in the iMac or the new Power Macintosh G3 (Blue and White). Note: Some Power Macintosh 6500 systems shipped with an internal 33.6Kbps modem. These modems are not supported by these updaters.

This article has been archived and is no longer updated by Apple.
Important Information About the Apple/GV 56K Updaters

These updaters support the internal modem which came with your Power Macintosh G3 (Desktop or Minitower or All-in-one, or Power Macintosh 6500 series computers. These updaters DO NOT support the modem in the iMac or the new Power Macintosh G3 (Blue and White). Note: Some Power Macintosh 6500 systems shipped with an internal 33.6Kbps modem. These modems are not supported by these updaters.

This document also contains several references to articles in the Apple Knowledge Base that discuss modem connectivity issues. These articles are recommended reading for better a understanding of 56K modem technology.

Why are there two Apple/GV 56K Updaters?

Unlike the 56K modems that ship with the PowerBook G3 Series or the iMac, the Apple/GV 56K modem DOES NOT support both the V.90 and K56flex protocols at the same time.

Apple/GV 56K Updater 2.200 - installs the V.90 protocol

Apple/GV 56K Updater v1.001 - installs the K56flex protocol

IMPORTANT: If your ISP supports only one of the two protocols (V.90 or K56flex) it is necessary to install the same protocol on your modem, otherwise your connections will be limited to speeds of 33.6kbps or less (V.34 protocols). This modem cannot automatically negotiate with the service provider to determine whether to use V.90 or K56flex. Check with your ISP to determine which protocol they support.

What The Apple Modem Updater Does

The Apple/GV 56K Updater 2.200 installs the V.90 protocol. If you have updated to the V.90 protocol and discover that your ISP only supports K56flex, run the Apple/GV 56K Updater v1.001 to install the K56flex protocol. The ROM on the Apple/GV 56K modem is capable of being updated several thousand times, far more than would be needed even under extraordinary conditions.

After you have updated the modem you may notice that the connection speed that is reported when you first establish a connection may be lower than it was prior to the upgrade, however the modem throughput will be at least as good and often better than before the upgrade. Throughput is the measure of how quickly a certain amount of data is transferred from one modem to another. It is important to remember that the connection speed that is reported is only the initial connection speed. The modems will adjust their communications speed as line conditions require.

A faster connection speed does not necessarily indicate a higher throughput, factors like resending data due to noise on the phone lines will lower overall throughput. This is discussed in more detail in article 30734, "**V.90 Protocol: Connectivity Discussion**" and article 24482, "**56Kbps Modems: Getting The Fastest Connection**".

Updating The Modem

Before updating your modem, make sure the modem and modem port are not in use. Turn answering off in fax or other communications programs. Log off any open Internet/modem connections. (Disconnecting the phone line will force any active modem connections to be closed.)

IMPORTANT Do not cancel the installation process once you start updating; canceling the upgrade process will damage the modem. This modem updater may take up to five minutes to complete.

To update your modem:

1. Double click on the Apple/GV 56K Updater icon.

2. Click Update Modem

3. Click OK to turn off AppleTalk. Note: You may be warned that the modem already contains the current firmware. Click OK to install the version of the firmware you have selected. Status messages appear as the updater installs the firmware onto the modem.

4. Click Quit when the update is complete.

5. Drag copy the file Power Mac G3 Internal 56K into the Modem Scripts folder, located in the Extensions folder within the System Folder. Click OK to replace any existing file. Open the Modem control panel and select: Power Mac G3 Internal 56K

Note: The new Power Mac G3 Internal 56K modem script should be used with both the V.90 and K56flex protocols.

You do not need to restart your computer after updating the modem firmware.

Future Modem Software

New firmware updates, modem scripts, and modem drivers may be released for 56K modems until the technology stabilizes. For more information on V.90 modem upgrade information, see Apple's support web site: **http://www.apple.com/support**

Support for Former Claris Software Products

This article has been archived and is no longer updated by Apple.

On 1998-01-27 Apple announced that its Claris subsidiary would restructure to focus exclusively on its FileMaker Pro line of database software. This article will help you find technical support for various software that was previously distributed, and supported, from the Claris Web site. The Claris Technical Library has been imported into Apple's Knowledge Base and selected Software Updaters have been tested by Apple's Software Engineers and posted to Apple Software Updates.

Go to AppleCare **Knowledge Base Search** page and select the "Archive" option for technical Information, and **Older Software Downloads** web page for the software for following products:

- ClarisDraw
- Claris Emailer
- ClarisImpact
- Claris Organizer
- ClarisWorks

Key Points of Support Information Regarding Former Claris Products:

ClarisDraw: There is no further development to ClarisDraw. The application AppleWorks (formerly known as ClarisWorks 5) includes a drawing option. Claris Draw 1.0v4 Updater posted to Apple Support automatically updates a copy you have made of your original ClarisDraw 1.0v1, v2, v3, or v4 updated prior to 1997-12-09.

Claris Emailer: The most recent update to this application program is the Claris Emailer 2.0v3 Updater. The original application is not available from Apple. Please note that the "Important Information" file installed with this update mentions the "Emailer Contextual Plugin" in the list of feature enhancements. This plugin, which was not developed by Claris or Apple, is no longer available and all references to it should be disregarded. (As of 1999-03-25, all Tech Info Library articles on Claris Emailer have been archived in the Tech Info Library Archive.

Fog City Software - is a Web site packed with Claris Emailer resources. In particular, visit their listings of **utilities**.

Claris Organizer: In a Press Release on 1998-05-11, Palm Computing, a division of 3Com and makers of the family of PalmPilot connected organizers, announced that it had acquired Claris Organizer. Palm will enhance and support the package, now called Palm Organizer with HotSync capabilities for PalmPilot organizers. For more information please visit the **Palm Computing** Web site. (As of 1999-03-25, all Tech Info Library articles on Claris Organizer have been archived in the Tech Info Library Archive.

ClarisWorks: ClarisWorks 5.0x has been renamed AppleWorks and comes with Apple's iMac and iBook computers. This application has a dedicated **AppleWorks support** Web site with links to Software, technical articles and other related Web sites. If you have an earlier version of ClarisWorks you can find information on updating your existing versions with the most recent update. Purchasing, third-party product, and education-focused information can be found on the **AppleWorks product** page.

ClarisWorks Users Group (CWUG), a private organization not affiliated with Apple, Inc. is available on the World Wide Web for ClarisWorks users. You will find hundreds of templates, graphics, fonts, and utilities in the comprehensive software library.

In the U.S., telephone Support Options can be purchased:

Apple Support Options

ClarisWorks, Claris Emailer, Claris Organizer, ClarisImpact, ClarisDraw:

- Toll: + 1 512 674 8700

> **Important:** Apple provides only installation support for these products.

All Other Claris Software:

- Toll Mac OS: +1 408 727 9054
- Toll Windows: +1 408 727 9004
- Fee Based: 1 (800) 965-9090

If you live outside the U.S. call your local Apple Assistance Centre for further details on available telephone support options.

Support for Newton Products

This article has been archived and is no longer updated by Apple.
On February 27, 1998 Apple Computer, Inc. announced it will discontinue further development of the Newton operating system and Newton OS-based products, including the MessagePad 2100 and eMate 300.

This article has been created to assist Apple Support Web Site customers in finding technical support for Newton products previously distributed, and supported, from various Apple Web sites.
Find Technical Information and Software Updates for the following products:

Technical articles for the AppleMessagePad and eMate are found in the Knowledge Archive. Use the following links to go directly to articles for the specific product or search the Knowledge base (select the "Archive" option) for specific articles and to older Apple product discussions.

There is a list of Software Downloads for English North-American versions of Software for Macintosh, Apple II and Newton released prior to Mac OS 8.1 in January 1998. All software listed on this list is considered obsolete and may do harm if improperly installed. Please use extreme caution. All software released since January, 1998 is available in the AppleCare Knowledge Base http://kbase.info.apple.com (needs Apple ID), although there may be some duplicates listed here. Use this URL to see the list of Newton downloads for Windows or for Macintosh platforms http://www.info.apple.com/support/oldersoftwarelist.html#newton

Newton or MessagePad Products	Technical Assistance Available Online
eMate 300	eMate 300 articles

MessagePad 110	MessagePad 110 articles
MessagePad 120	MessagePad 120 articles
MessagePad 130	MessagePad 130 articles
MessagePad 2000	MessagePad 2000 articles
MessagePad 2100	MessagePad 2100 articles
Newton Software	Newton Software Downloads

Key points of support information regarding former Newton Products:

MessagePad 2000 UpgradeProgram
The upgrade program introduced November 10, 1997 ended April 30, 1998

Unable to Access Newton Website

Customers may encounter a DNS error when using an old url to the Newton Specific Apple Web site at "newton.apple.com". Apple no longer hosts a Newton Web site and this is no longer a valid url.

Macintosh Users Groups

If you are looking for motivated Newton Users who might help you find what you are looking for you can use the Discussion links featured above or use Apple's User Group Locator to find a group dedicated to Newton products.

User groups offer the greatest support bargain for most computer users. Within a user group you'll find some of the most helpful and knowledgeable computer experts, and they're willing to share their experience and advice. In addition, many user groups schedule speakers and events that give you a chance to keep up-to-date and learn more about the possibilities of your computer.

Apple Discussions Forum
If you searched the Knowledge Archive and Software Updates and are still unable to find an answer to your Newton or eMate related question please visit Discussion's and select the appropriate category. You can search for discussions relating to your question, or you can read through the existing posts.

Use this link to go to Apple Discussions: http://discussions.info.apple.com/

If you're new to Apple Discussions, there is Apple Discussions Help available from the Discussions Web site.

For other technical support please see the AppleCare Overview Web page.

Macintosh: Support for earlier operating systems

This article has been archived and is no longer updated by Apple.
Support for Mac OS 8.0 and later can be found in the Software Support Web pages on the Apple Support Web site :

Mac OS 8.1: http://www.info.apple.com/usen/macos8.1/
Mac OS 8.5: http://www.info.apple.com/usen/macos8.5/
Mac OS 8.6: http://www.info.apple.com/usen/macos8.6/
Mac OS 9.0/9.1 : http://www.info.apple.com/usen/macos9/

Please be aware that issues and solutions for Older System Software found in the Knowledge Base have often been solved in more recent releases of System Software. Therefore, it is recommended that you run the most recent system software on your Macintosh.Technical Information can be found in the Knowledge Base: To find articles that relate to your Operating System you can search the Knowledge Base or Knowledge Archive. For assistance in using the Search option to the best advantage please use the Knowledge Base Help option. The Knowledge Base http://kbase.info.apple contains recent updated documents from approximately January 1998 to today.

The Knowledge Archive contains articles covering older Apple products (select the "Archive" option at the search screen). Archived documents are not updated.

The Knowledge Archive articles featured below relate to System 7 and later versions of the Macintosh Operating System.

Document Number 30152: **Mac OS: Upgrading from Older OS Versions**
This article lists different options for obtaining various version of System Software, System Upgrades and Mac OS Software.

Document Number 15582: **Macintosh: System Software Version History**
This article contains a history of older versions of Macintosh System SoftwareDocument Number 21176: System 7: 7.5.3 and Later Enabler Matrix

Document Number 20249: **System 7.5: Updates, Versions, & What's Installed**
This article lists all Macintosh cpus and the versions of System 7.5.3 and later that they support. It also lists current versions of required enablers.

If you are confused about System 7.5 and its updates please read this article archive article 20081: **What Updates Do I Need for System 7.5.5?**

Questions and answers for customers who had System 7.5.3 pre-installed on their hard drive.
Download System 7.5 version 7.5.3 full install from http://www.info.apple.com/support/oldersoftwarelist.html

Document Number 20408: **System 7.5.5 Update: Frequently Asked Questions (1 of 2)** contains the answers to frequently asked questions (FAQ) about System 7.5.5 Update. **Download System 7.5.5** from **Older Software** downloads.

Many Customers with older Macintosh computers ask Apple where they can find Mac OS 7.6. Document Number 26170: **Where to get Mac OS 7.6 and 7.6.1**

Software Updates can be found in the Software Updates Library:
Software updates for earlier versions of Mac OS and Apple hardware are available by browsing the Downloads Web site. You can look at the Older Software Downloads page for a list of all software released prior to January 1998.

Document Number 14724: **Where to Find Apple Software Update** explains where to find Apple Software Updates that are available for downloading.

Browse the Apple II and Apple IIGS Directory
Browse Older System Software Directory

Apple Discussions Forum
Use this link to go to the **Mac OS Discussion Forum**.

If you're new to Discussions, use the **Help** link under **Options.**

User Groups:
User groups offer the greatest support bargain for most computer users. Within a user group you'll find some of the most helpful and knowledgeable computer experts, and they're willing to share their experience and advice. In addition, many user groups schedule speakers and events that give you a chance to keep up-to-date and learn more about the possibilities of your computer. Please visit Apple's User Groups Locator web page.

Support for Apple Printers

This article has been created to direct customers to technical support for Apple Printers.

This article has been archived and is no longer updated by Apple.
Please be aware that issues and solutions for older system software found in the **Older Software List** have often been solved in more recent releases of system software. Therefore, it is recommended that you run the most recent system software that works with your Macintosh computer. For support and information on older Mac OS versions please see Knowledge Base document number **26181**.

If you have looked at product support information in the resources listed below and have not found a resolution to your Mac OS related issue, you may wish to visit **Apple Discussions**.

Apple Printers

Apple Spec Database has Technical Specifications and Descriptions
You can find technical specifications for the following products in Apple Spec Database

- Dot Matrix Printer
- Ink Jet Printers: StyleWriter and Color StyleWriter
- Laser Printers: LaserWriter, Color LaserWriter and Personal LaserWriter
- They are also available by searching the Knowledge Base or the Knowledge Archive.

About the Knowledge Base and Knowledge Archive:

You can find technical information on all Apple Printers in the Knowledge Base or the **Knowledge Archive** (select the "Archive" option before searching).

Software for Apple Printers:

Where to Find Software Downloads:
Software Downloads for Apple Printers can be found on the Apple **Older Software Downloads** Web page or search the **Featured Software** Web page.

Three documents have been created to help customers identify and find the appropriate printer drivers and cables. If you are looking for a driver or cable for your printer, please refer to one of the following documents:

StyleWriter Printers: Print Drivers & Cable Matrix - Document number **30153**
LaserWriter Printers: Mac OS Print Drivers & Cable Matrix - Document number **30154**
Other Printers: Print Drivers & Cable Matrix - Document number **15372**

Key issues and support information regarding Apple Printers:
The following documents have been identified as providing relevant support information for Apple Printers:

Apple LaserWriter Printer Tips -Document number **20032**
Apple LaserWriter Printers: Frequently Asked Questions -Document number **18219**
Apple StyleWriter Printers: Frequently Asked Questions -Document number **18232**
LaserWriter: Communication Mode Switch Setting: Document number **24318**
LaserWriter Driver 4.2.2 for Windows 95 - Document number **24439**
Mac OS: Desktop Printing Troubleshooting - Document number **24306**
Printers & Imaging: Frequently Asked Questions -Document number **22143**
QuickDraw-Based Printers: Not Compatible With IBM PCs -Document number **9507**

For more specific questions please search the Knowledge Base.

Apple Discussions
If you have searched the Knowledge Base and Software Updates and you are still unable to find an answer to your Apple printer related question please visit **Apple Discussions**. You can search for discussions relating to your question, or you can read through the existing discussions. Finally, if you have exhausted all other options please post your question. If you are new to Apple Discussions there is Apple Discussions Help available.

If you have tried all of the above Online options for solving your Printer related question and you still need help, please review the **Support Options** web site.

Macintosh: Support for Older Model Computers

This article has been created to assist owners of older model Macintosh computers locate support information.
This article has been archived and is no longer updated by Apple.
The following are considered to be older model Apple Computers:

- Classic Macintosh Systems
- Macintosh II Systems
- Macintosh LC Systems
- Macintosh Performa Systems
- Macintosh Centris & Quadra Systems
- Power Macintosh Systems prior to Power Macintosh G3
- Systems Upgraded to PowerPC

Please be aware that issues and solutions for older system software found in the Knowledge Archive have often been solved in more recent releases of system software. Therefore, it is recommended that you run the most recent system software that works with your Macintosh computer. For support and information on older Mac OS releases, please see article number 26181.

To find out if your Macintosh computer is in the Legacy Product Support category, please visit the Legacy Support Web page to see a list of qualifying products. If you have exhausted the resources listed below you may wish to proceed directly to

- Apple Discussions - Older Apple Products.

About the Knowledge Base and Knowledge Archive:

You can find technical information on all Apple Computers in the Knowledge Base. The Knowledge Base has over 14,000 technical articles and is updated daily. The Knowledge Archive contains Knowledge Base articles covering older Apple products (Select the "Archive" option before searching). Archived articles are not updated.

About Software Updates:
The Apple Software Library is a collection of updaters, utilities, and full software installs to help keep your Apple Products running smoothly. You can locate a particular software file by either searching our library, browsing our hierarchy, or viewing a list of the most recent postings. All software available from this site is covered by the software license agreement included with this software. Read Download Help if you need assistance downloading software. Apple Software Update web page is at: http://asu.info.apple.com

Software for Older Macintosh Computers:
For information on Upgrading system software and other options please read article number 26181: Support for Older Macintosh Operating Systems

Some Issues Identified in Older Model Computers:

Power Macintosh: Frequently Asked Questions (FAQ) Article number 42501 is comprised of questions frequently asked on the Power Macintosh discussion forum.

Macintosh Family: Batteries and Part Numbers (FAQ) Article number 11751 contains frequently asked questions about Macintosh family batteries and part numbers, and answers to those questions.

Disk First Aid Version 8.2 Read Me Article number 30567 describes this utility which is intended for 68040 and PowerPC-based Macintosh computers using Mac OS 8.1. It is a utility that verifies and repairs some problems that may occur on your hard disk drive.

Flashing "?": Solution on Performa/Power Mac 54xx, 55xx, 6400, & 6500 Article number: 22078

Macintosh 5xxx/6xxx Tester: Read Me Article number: 19999 contains the ReadMe file for the 5xxx/6xxx Tester application, which should be used with all Power Macintosh and Performa 5200, 5300, 6200, and 6300 series computers to test for known component issues that may cause system freezing.

Macintosh 5xxx/6xxx: Microprocessor Issue Article number: 18616 describes an issue with some PowerPC 603 microprocessors installed on a limited number of Macintosh and Performa 5200 and 6200 series computers.

Power Macintosh/Performa 52xx/62xx: Continuous Beep on Startup Article number: 22193
Discusses an issue after installation of Mac OS 8.1. During startup, the computer will emit a "squealing" sound, similar to a car horn sounding continuously. The sound will continue until a new sound is played or the volume is changed.

Apple Spec Database has Technical Specifications and Descriptions
You can find Technical Specifications for the following products on the Apple Specification page.

Classic Macintosh Systems; Macintosh II Systems; Macintosh LC Systems; Macintosh Performa Systems; Macintosh Centris & Quadra Systems; Macintosh PowerBook Systems; Power Macintosh Systems; Systems Upgraded to PowerPC

Product Documentation Archive
Apple product manuals are available in the **Knowledge Base**. Search using the product name followed by kmanual. For example to locate the Macintosh Performa manuals, you would type:

```
performa kmanual
```

For iMac manuals, type:

```
iMac kmanual
```

All manuals are in Adobe Acrobate format. Adobe Acrobat Reader version 3.0 or later is required to view the manuals. For further information view the Help document found on the Navigation Bar

Apple Discussions
If you have searched the Tech Info Library and Software Updates and you are still unable to find an answer to your older Macintosh computer related question please visit Apple Discussions for Older Apple Hardware Products. Finally, if you have exhausted all other options please post your question. If you are new to the Discussion Forum there is a Help document available at the top of every page.

If you have tried all of the above Online options for solving your older Macintosh computer related question and you still need help, please review the Support Options web site.

AppleShare IP 6.3: System Requirements, New Features, and Setup

This article provides system requirements and important information about AppleShare IP 6.3 features and setup.
This article has been archived and is no longer updated by Apple.
AppleShare IP 6.3 is available as a retail product or as a software update for owners of a previous version of AppleShare IP 6. The AppleShare IP 6.3 Update may be downloaded from the Apple Software Updates Web site at http://www.apple.com/swupdates.

Important: If you are using Shared Users and Groups with AppleShare IP 6.2, be sure to read the additional installation information provided with the AppleShare IP 6.3 Update.

New Features

- Mac OS 9 compatibility
- Mac OS Server Admin for remote or local server administration
- ability to administer multiple AppleShare IP 6.3 servers at once
- support for sleep features on client computers
- support for Network Services Location Manager (NSL)
- improved features of home directories
- setup guest access for each service
- Power Mac G4 compatibility

Note: To ensure peak performance and compatibility with the latest Apple hardware, be sure to check Apple Software Updates (http://www.apple.com/swupdates) for the latest AppleShare IP updates. AppleShare IP only utilizes one processor on dual-processor Power Macintosh computers.

New System Requirements

The following additional system requirements are new with AppleShare IP 6.3. Previous system requirements still apply; see your AppleShare IP 6 Getting Started manual for details.

- Any Apple Power Macintosh computer, iMac, or Macintosh Server with a PowerPC G4, G3, 604e, 604, or 601 microprocessor, or a 6500 series computer with a 603e microprocessor
- Mac OS 9
- 80 MB RAM with virtual memory off or 64 MB RAM with virtual memory on
- 250 MB of free hard disk space.

Requirements for Mac OS Server Admin

- Any Macintosh computer with Mac OS 8.6 or later installed
- Monitor with resolution of 800 x 600 or better
- A TCP/IP connection to the network on which the server resides, which may be via the Internet
- 20 MB of free hard disk space
- 5 MB of RAM (you may need more RAM if you want to administer more than three servers at once)

Installation Instructions

Preparing Your Computer

Before installing Mac OS 9 and AppleShare IP 6.3, you should back up your server. When backing up, make sure that the AppleShare IP Web & File Server is running. If you do not have back up software available make a copy of your System Folder. This will allow you you to switch back to your previous version of AppleShare IP if you desire.

Installing Mac OS 9 and AppleShare IP 6.3

If you are installing Mac OS 9 and AppleShare IP 6.3, be sure to install Mac OS 9 first following the instructions that come with that software. Then restart the computer with extensions off by holding down the Shift key while restarting.

To preserve your previous AppleShare IP setup, it's recommended that you do not perform a clean installation of Mac OS 9.

If you choose to perform a clean installation of Mac OS 9, you need to install Mac OS 9, then your previous version of AppleShare IP 6.x. Then you need to restart the computer with extensions off by holding down the Shift key while restarting, and install the AppleShare IP 6.3 Update. You

should then copy the file "Users & Groups Data File" from the Preferences folder in the Previous System Folder to the Preferences folder inside your newly-created System Folder.

After a clean install of the system software you must:

- enter a static IP address in the TCP/IP control panel
- enter an owner name, password, and computer name in the File Sharing control panel

If you do not set up these control panels properly, you will not be able to log on to Mac OS Server Admin and set up network services. (You use the owner name and password to log on to Mac OS Server Admin.)

Installing AppleShare IP Software

To perform an installation, double-click the icon labeled Installer and follow the instructions onscreen. There is not a custom installation option.

Installing AppleShare 3.8.5 Client Software

To update client computers to AppleShare 3.8.5, see the AppleShare Client 3.8 User's Manual in the Client Software 3.8.5 folder on your hard disk. See your license agreement for the number of clients your AppleShare IP server may have.

Installing the Thread Manager

In rare cases, AppleShare IP 6.3 may stop responding when running under heavy load. The AppleShare IP Thread Manager is an extension that fixes this problem and provides greater stability of AppleShare IP 6.3 when the server is busy.

After you install AppleShare IP 6.3, follow these steps to install the AppleShare IP Thread Manager:

1. Open the Install ASIP Thread Manager folder on the AppleShare IP 6.3 Install CD.
2. Drag the AppleShare IP Thread Manager file onto the System Folder of your AppleShare IP 6.3 server.
3. Click OK to put the file in the Extensions folder and to replace any earlier versions of this extension.
4. Restart your computer

Setting Up AppleShare IP

Using Easy Setup

You need to use the AppleShare IP Easy Setup program before you can use AppleShare IP. The program asks a few questions about how you plan to use AppleShare IP and sets up your AppleShare IP servers accordingly.

To use the Easy Setup program, double-click the Setup AppleShare IP icon on your computer desktop. Follow the instructions that appear onscreen. Your previous serial number will appear automatically; you do not need to enter a new serial number.

If you need more help using the Easy Setup program, see your AppleShare IP 6 Getting Started manual.

Using Mac OS Server Admin for the First Time

The Mac OS Server Admin program is located in the Mac OS Server Admin folder, inside the AppleShare IP 6.3 folder. Double-click the Mac OS Server Admin icon. You will be prompted to login with your server's ip address or DNS name, your administration name, and password. Once you have logged on to your AppleShare IP server, a service window appears for that server. Modules for each service installed on your server will appear in the service window.

If you installed AppleShare IP before you set up the TCP/IP and File Sharing control panels you may need to do the following before you can login with Mac OS Server Admin:

1. Open the Extensions Manager control panel and turn off the AppleShare IP Registry extension.
2. Restart the computer.
3. Open the File Sharing control panel and type an owner name, password, and computer name.
4. Close the File Sharing control panel.
5. Open the TCP/IP control panel and choose Manually from the Configure pop-up menu. Then enter an IP Address and other network information.
6. Close the TCP/IP control panel.
7. Open the Extensions Manager control panel and turn the AppleShare IP Registry extension back on.
8. Restart the computer.

Setting Up Remote Admin for the First Time

To use the web browser-based remote administration feature in AppleShare IP, you need to enable it in Mac OS Server Admin. You also must use an administrator account to use this feature.

For extra security, you can use TCP Filter software to allow access to the AppleShare IP Remote Admin application only from specific computers. See the TCP Filter section of AppleShare IP Help for details.

Follow these steps:

1. Launch Mac OS Server Admin and connect to the server.
2. Select the web server admin module.
3. Choose "Configure Web Server..." from the pop-up menu.
4. Select the "Allow administration via AppleShare IP Remote Admin" checkbox.
5. Click Save.
6. If the web server is not running, start the web server.

Your changes take effect immediately. To administer your server remotely from any computer on the network, type the following URL in any industry-standard Web browser:

http://<your Web server's DNS name or TCP/IP address>/.admin

For More Information

See AppleShare IP Help. You can open AppleShare IP Help by choosing AppleShare IP Help from the Help menu within any AppleShare IP administration program, or by double-clicking the AppleShare IP Help icon in the AppleShare IP 6.3 folder.

If you are using Remote Admin, see AppleShare IP Remote Help. To access Help while you are using the Remote Admin application, click the Help link at the bottom of any Remote Admin page in your Web browser. You can also double-click the AppleShare IP Remote Help icon in the AppleShare IP 6.2 folder.

If you need help while using the Mac OS Server Admin program, open the Help menu and select Mac OS Server Admin help.

For recent downloads, refer to the Apple Downloads page at http://www.apple.com/support/downloads/ and search AppleShare IP.

Apple Discussions (PowerBook): Frequently Asked Questions

This article has been archived and is no longer updated by Apple.

This document contains a number of frequently asked questions (FAQ) in the PowerBook Discussions.

Each question is followed by one or more links to technical documents that provide answers, suggestions, or troubleshooting advice to help you deal with the issue that creates the question.

Some of the documents have pointers to useful suggestions posted on the board by other users. These may or may not also have an official Apple answer, but this will be noted where applicable.

If the questions below do not contain an answer to something you are looking for, you can continue to search for using the Knowledge Base, or you can go directly to the PowerBook Discussions forum (http://discussions.apple.com/category.jspa?categoryID=120).

Apple's Support Team identifies and makes available important information and relevant software updates on the Important Page. If you don't find information relating to your issue you can click Discussion on the Navigation bar to go to the Discussion Forum.

Take some time to look through the board, or use its search function. It is quite likely your question has come up before, even if it does not have the frequency of the ones listed below. If you find a previously posted question that matches yours, read the posted answers. If you still did not find an answer, please feel free to either post a new topic describing your issue, or add a reply to an existing topic that closely matches your issue.

Questions answered in this article:

1. Every time I connect to my Internet service provider (ISP), Apple Remote Access disconnects me after about ten minutes.
2. How can I print from my IrDA-capable PowerBook to an IrDA laser printer?
3. Sometimes an out of memory error appears and my PowerBook stops working when using the File Synchronization control panel.
4. My PowerBook G3 Series battery does not seem to charge when the PowerBook is running. It charges when the PowerBook is in sleep mode. What's wrong?
5. My PowerBook G3 Series computer cannot make a modem reconnect after waking from sleep.
6. The bottom of my PowerBook G3 Series becomes very warm after extended periods of use. Is there an issue with my PowerBook?
7. The internal backup battery in my PowerBook G3 Series does not maintain the date and time settings properly.
8. What are the specifications for the PowerBook G3 Series computer?
9. What type of external display can I use on my PowerBook G3 Series computer? What resolutions can I get with an external Monitor?
10. My PowerBook display has pixels that are always on, even on a black background. Can the display be replaced?
11. My PowerBook hard drive makes clacking noises. Is this normal?
12. My fax software does not pick up the call and receive the fax.
13. My PowerBook G3 series loses network services when using the built-in Ethernet port.
14. I am having difficulties when I try to print to a serial printer.
15. I will be travelling overseas and will be taking my PowerBook computer with me. Which adapters do I need for the power and modem?

Question 1: Every time I connect to my Internet service provider (ISP), Apple Remote Access disconnects me after about ten minutes.

Answer: See technical document 24802: "**Apple Remote Access: Disconnects After Ten Minutes**"

Question 2: How can I print from my IrDA-capable PowerBook to an IrDA laser printer?

Answer: See technical document 30861: "**PowerBook: Printing to an IrDA Printer**"

Question 3: Sometimes an out of memory error appears and my PowerBook stops working when using the File Synchronization control panel.

Answer: See technical document 24711: "**Mac OS: Out Of Memory Errors With File Synchronization**"

Question 4: My PowerBook G3 Series battery does not seem to charge when the PowerBook is running. It will charge when the PowerBook in sleep mode. What's wrong?

Answer: These things may prevent the battery from charging while the PowerBook is in use: failure of the charging circuit, a bad battery, or an issue with the AC adapter or wall socket.

To help narrow down the possible cause, follow these steps:

- Shut down the PowerBook. Connect it to AC power overnight and see if the battery is charged. If so, your PowerBook should be repaired. If it does not charge, try the next step.
- Make sure the AC outlet works by plugging another electrical device into the AC outlet and turning on the device.
- If the outlet is working, try another PowerBook AC adapter, if available.
- Download and install the **PowerBook Battery Reset version 2.0** from Apple Software Downloads.

Question 5: My PowerBook G3 Series computer cannot make a modem reconnect after waking from sleep.

Answer: Install ARA Client 3.0.1 Updater. It is available from document 30716: "**About ARA 3.0.1 Client Updater Document and Software**"

Question 6: The bottom of my PowerBook G3 Series computer becomes very warm after extended periods of use. Is there an issue with my PowerBook?

Answer: See technical document 30612: "**PowerBook G3 Series: Operating Temperature**"

Question 7: The internal backup battery in my PowerBook G3 Series does not maintain the date and time settings properly.

Answer: See technical document 30580: "**PowerBook G3 Series: Backup Battery Life**"

Question 8: What are the specifications for the different PowerBook computers?

Answer: Technical specifications are available from the Apple Spec database (http://www.info.apple.com/applespec/applespec.taf)

Question 9: What type of external display can I use on my PowerBook G3 Series computer? What resolutions can I get with an external monitor?

Answer: See these technical documents:

- Document 24614: "**PowerBook G3 Series: Video, Graphics, And Sound FAQ**"
- Document 24232: "**PowerBook G3: Video Out Specifications**"
- Document 28503: "**PowerBook G3 Series: External Video Out**"
- Document 28504: "**PowerBook G3 Series: External TV Out**"

Question 10: My PowerBook display has pixels that are always on, even on a black background. Can the display be replaced?

Answer: If you see a "stuck" pixel on your display, take a look at this technical document, which explains this situation. Document 22194: "**Pixel Anomalies on Active Matrix LCD Panels**"

Question 11: My PowerBook hard drive make clacking noises. Is this normal?

Answer: See technical document 30593: "**PowerBook: Hard Drives and Noise**"

Question 12: My fax software does not pick up the call and receive the fax.

Answer: Occasionally, the modem will go into data mode instead of the idle (fax) mode. When this happens, the modem will no longer answer an incoming fax call. See technical document 24480: "**FaxSTF: Not Picking Up Fax Phone Calls**"

Question 13: My PowerBook G3 series loses network services when using the built-in Ethernet port.

Answer: You may need the G3 Ethernet 2.0.4 software, which is available from document 24540: "**Power Macintosh G3 Ethernet (Built-In) Driver v2.0.4**"

Question 14: I am having difficulties when I try to print to a serial printer.

Answer: Make sure you have turned AppleTalk off in the AppleTalk control panel. These links will provide additional troubleshooting tips:

- Document 30340: "**Mac OS 8.1: Late Breaking Tips**"
- Document 16067: "**PowerBook: Printing to Serial Printer with One Serial Port**"

Question 15: I will be travelling overseas and will be taking my PowerBook computer with me. Which adapters do I need for the power and modem?

Answer: The PowerBook computers can use 115 V and 230 V AC. You will need a power prong adaptor available at many electronic and travel retailers. Review the following technical document for more details. Document 129: "**World Power Differences Can Limit International Product Usage**"

Most modems are not certified to be used in other countries. It would be best to use an external modem purchased in the destination country.

PowerBook G3 Series: External Video Out

What are the external video options on the PowerBook G3 Series?
This article has been archived and is no longer updated by Apple.

External Video

The PowerBook G3 Series (M4753) computers have a built-in connector for an external VGA or SVGA monitor. An included adapter allows you to attach a standard Apple video cable.

The Video port can provide up to millions-of-colors of video output at the following resolutions: (Note: Not all monitors are capable of displaying all the resolutions listed in the following table.)

Resolution	2 MB Video RAM	4 MB Video RAM
512 x 384	24 bpp (millions)	24 bpp (millions)
640 x 480	24 bpp (millions)	24 bpp (millions)
800 x 600	16 bpp (thousands)	24 bpp (millions)
832 x 624	16 bpp (thousands)	24 bpp (millions)

How do I use an External Monitor?

1. Shut Down or put the PowerBook to sleep.
2. Connect the Monitor to the 15-pin VGA style connector on the back of the PowerBook.

Figure 1, Monitor cable connection diagram

3. Power the Monitor On.
4. Power on or wake the PowerBook.
5. When the PowerBook has booted, choose the resolution to display on the external monitor. It will either cause the external monitor to show the video, or if in a simulscan mode, both the monitor and the PowerBook will display the same image.
6. The PowerBook G3 Series 233/512K L2, 266Mhz, and 300Mhz computers have options for scaled resolutions of the internal display at resolutions of 640 x 480 and 800 x 600. (**Note:** The full capabilities of the displays can be obtained only with the proper driver software. Download and install ATI Driver Update 1.4.7 if you cannot achieve the scan rates listed here when in simulscan mode.)
7. PowerBook G3 Series computers with 12.1 TFT(active matrix) support scaling at 640 x 480 but the standard is still 800 x 600.

How to read all of these choices...

Figure 2, Monitors control strip showing available resolutions after connecting an external monitor to the PowerBook.

Figure 3, Monitors control strip with no external monitors attached.

Figure 4, Monitors control strip showing all of the available resolutions after one of these computers is connected to an external monitor.

1024 x 768 (built-in) - selecting this option will cause the video to only show on a 13.3 or 14.1 inch PowerBook display. On a 12.1 inch display, this setting will be 800 x 600 (built-in).

1024 x 768, 60 Hz (simulscan) - On the PowerBooks with 13.3 or 14.1 inch displays, this setting will mirror the PowerBook display on the external monitor. On a 12.1 inch PowerBook display the option will be 800 x 600, 60 Hz (simulscan).

All of the other options in the list will display that resolution video on the external monitor and turn off the video from the PowerBook LCD.

Display	PowerBook Display Resolution	Simulscan Resolution	PowerBook display video only resolution	Ext. monitor display video only resolutions
12.1	800 x 600, 60 Hz	800 x 600, 60 Hz	800 x 600	all others
13.3 and 14.1	1024 x 768	1024 x 768	1024 x 768	all others

Not all monitors will support this complete list of resolutions. When you connect to an external display and select a resolution from the menu above, after the resolution is changed, you will see a dialog box which asks to confirm your choice. If you press return or do nothing, the resolution will be switched back to what you were running. This is to prevent you from switching to an unsupported resolution. If both displays are blank and the customer does nothing, then the PowerBook will revert to the previous resolution.

Figure 5, Monitor settings confirmation dialog box.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: "**PowerBook G3, G3 Series: Identifying Different Versions**"

PowerBook G3 Series: External TV Out

How can a PowerBook G3 Series computer be connected to a TV?
This article has been archived and is no longer updated by Apple.

TV Out

Some Powerbook G3 Series models come equipped with a TV out port (also called video out, not to be confused with External Video support) on the rear of the computer. See Figure 1.

Figure 1: TV out port.

It is an S-Video type of connector (the one that looks similar to the keyboard connector).

How Do I Use TV Out?

In the example below, we will use a TV as the device we're connecting to; the same steps apply for VCRs as well.

1. Shut Down the PowerBook or put it to Sleep.
2. Connect the PowerBook G3 Series to the TV using either an S-Video to S-Video cable or an S-Video to RCA Composite Video cable.
3. Set the TV to the line-in or whichever channel will display the PowerBook video (see your TV or VCR manual for this).
4. Power on or wake the PowerBook.
5. When the PowerBook has started up, choose the resolution to display on the TV. You will get a series of options like those shown in Figure 2.

Figure 2: Resolution options.

What Do All Those Video Options Mean?

1024 x 768 (built-in): This is the PowerBook display video-only setting. Selecting this will not display any video to the TV.

All other selections: These are all of the resolutions that a TV can display. Unlike RGB or VGA monitors, TVs can only display computer video at certain resolutions which limits the size of the screens that are selectable.

If you are getting corrupted video on the TV, make sure you have selected a resolution under the (NTSC) selections. The PowerBook G3 Series can use TV Out to both North American (NTSC) and European (PAL) TVs. If you are using a PAL resolution on a U.S. TV, it will give a corrupted video image. To resolve this, disconnect the TV, restart the PowerBook so the display is showing on the PowerBook's display only, follow the directions above and make sure you choose an NTSC setting.

Connecting to a VCR or TV

Figure 3 shows how a TV can be connected to the TV out port of the PowerBook G3 Series. This also applies to a VCR as well.

Figure 3: Connecting a TV.

Aarticle 8405: "**Macintosh: Video Mirroring and Extended Desktop Defined**" provides some additional information on what video mirroring is and when it should be used.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, please see the following article:

PowerBook G3 Series: Keyboard

How does the keyboard differ from other PowerBook models?
This article has been archived and is no longer updated by Apple.
The keyboard on the PowerBook G3 Series (M4753) computer has a new layout with all the features of an Apple Extended Keyboard. You can hold down the function key to activate the extended keyboard functions. To activate the embedded numeric keypad, you hold down the function key and press the F5 (num lock) key. The num lock LED lights to indicate that the numeric keypad is active. In that mode of operation, only the numeric keypad, the modifier keys, and certain other special functions are active. While the keyboard is in the keypad mode, you can type alphabetical information by holding down the function key.

There are two different states that the keyboard can be put into using the function key. They are: function key held down and num lock active. Below are some illustrations of the keyboard and what the keys will do in each of these different states:

Function key held down - In this mode, the letter and number keys still operate normally, however, the keypad can be used for page up page down, end and home which are usually keys that are located on extended keyboards.

Figure 1, Function key and arrow key locations

Num Lock Mode - This mode is activated by pressing function-F5. When the num lock mode is active, the light to the left of the F5 key will be lit. In this mode, the letter keys are disabled and some are converted to only type numbers as a numeric keypad would operate. The illustration below shows which keys operate as numbers.

Figure 2, Function key, num lock and embedded numeric keypad
Each of the keys that are modified by the function key has small brown-yellow text printed on the key to indicate its uses.

Key Caps
Note: In the illustrations below, the num lock light has been added to the Key Caps graphics. The light is not present on the normal Key Caps desk accessory.

Below are Key Caps illustrations of how this will work:

Figure 3, Num lock light unlit.

Notice that the light right above the 5 key is not lit. This indicates that the keyboard is in normal operation mode. This light indicates whether the num lock is active.

Figure 4, Lit num lock light.

On this keyboard, the light above the 5 key is lit. This is lit by pressing the function key right next to the ctrl key on the keyboard and pressing the F5 key. The light comes on and the only active keys will be ones listed above along with:

arrow keys
function key
ctrl key
option key
command key
space bar
shift key
tab key
caps lock key
escape key
F1 - F12

All other keys are disabled until you press the function-F5 key combination again to return the keyboard back to its normal configuration. Note that when the keyboard is in keypad mode, you can access all of the normal keys by pressing the function key and the key. While the function key is pressed normal keys are accessible.

- You will not be able to use key combinations like command-shift-3 when in the keypad mode. You will still be able to restart the keyboard with ctrl-command-power key.
- When the keyboard is in keypad mode. If you restart the computer, it will remain in keypad mode when it starts up. If you have password security active, the computer will not recognize your password. If this happens check if the num lock light is on, if it is, press function-F5, the light should go off, then you can type in the password.
- If you are using an application which does not support the extended keys, make sure that the function keys are functioning in SimpleText. If the Page Up, Page Down keys are working in SimpleText, then contact the vendor of the application for an update.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: "**PowerBook G3, G3 Series: Identifying Different Versions**"

Published Date: Feb 20, 2012

PowerBook G3 Series: RAM

What type of RAM is used in the PowerBook G3 Series computer?
This article has been archived and is no longer updated by Apple.
PowerBook G3 Series computers use SDRAM in a SO-DIMM slot which is smaller than the RAM slots for desktop Power Macintosh computers. There are two SDRAM SO-DIMM slots. One is located on the bottom of the processor card and the other is located on the top portion of the same module. The bottom slot is not customer accessible and RAM replacement or upgrades using this slot must be dealer installed. The top slot is user installable. For instructions on how to install memory in the top slot see the user manual for some models or the Help Center under the Help menu for other models.

PowerBook models ordered with extra RAM through the build-to-order (BTO) program (or CTO configure-to-order), the extra RAM will usually be installed in the upper slot, but can be installed in the bottom slot. This means that a PowerBook purchased through the BTO program may have both RAM slots populated.

To verify, check the Apple System Profiler under the Apple menu. In the Apple System Profiler go to the System Profile tab. Under this tab in the Memory Overview section look at the Built-in memory subsection for the location of any installed memory.

Third-party RAM is compatible if it meets the following criteria:

- 16, 32, 64, or 128 MB module (the PB G3 Series 1999 also supports a 256 module in the top slot).
- 1.0, 1.25, 1.5, or 2.0 inches in height (1.0, 1.25, 1.5 in the lower slot).
- 144-pin.
- 100 MHz or faster.
- 10 nanosecond or faster (a lower number is faster).
- 3.3 volt (V)
- Unbuffered, 64-bit wide, with Serial Presence Detect.

The maximum amount of RAM supported in all PowerBook G3 Series except the PowerBook G3 Series 1999 is 192 MB. This can be achieved by installing a 128 MB module on the upper slot and a 64 MB module in the lower (dealer accessible only) slot.

The maximum amount of RAM supported in the PowerBook G3 Series 1999 is 384 MB. This can be achieved by installing a 256 MB module on the upper slot and a 128 MB module in the lower (dealer accessible only) slot.

Important: The lower RAM expansion slot will only accommodate SO-DIMMs which are 1.0 through 1.5 inches in height. A 2.0-inch DIMM will not physically fit into the slot and cannot be used. EDO SO-DIMM RAM modules are not compatible with the PowerBook G3 Series. If you use an EDO SO-DIMM (from a PowerBook 2400, for example), the computer will start up fine but will not show any RAM increase in the "About this Computer" window.

Notes:

1. iMac RAM is compatible with PowerBook G3 Series computers.

2. For additional information on upgrading the memory, in the PowerBook G3 Series (Bronze keyboard), read Knowledge Base article 58325: "**PowerBook G3 Series (Bronze keyboard): Upgrading Memory**"

3. For additional information on upgrading the memory, in the PowerBook G3 Series, read Knowledge Base article 25002: "**PowerBook G3 Series: Upgrading Memory**"

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read Knowledge Base article 24604: "**PowerBook G3, G3 Series: Identifying Different Versions**"
Published Date: Feb 19, 2012

PowerBook G3 Series: Control Strip Contents Described

What are the modules in the PowerBook G3 Series Control Strip?
This article has been archived and is no longer updated by Apple.
The Control Strip modules found in the PowerBook G3 Series are, from left to right:

Figure 1, PowerBook G3 series Control Strip modules

AppleTalk
Battery Monitor
CD-ROM Controls
Energy Settings
File Sharing Settings
Hard Disk Spin Down
Expansion Bay (detailed below)
Monitor Bit Depth
Monitor Resolution
Printer Selection
Sound Volume
Sound Source
and, if an external Monitor is present, Video Mirroring (not shown)

Note: The Control Strip graphic above has been split in half to preserve space on the page.

Expansion Bay Control Strip
The media bay control strip shows the current status of expansion bay devices that are installed in the PowerBook. Because expansion bay devices can be hot-swapped (meaning you do not need to shut down to remove them), the control strip can reflect whether a device is installed, and the type of device.

The table below shows the state of the Control Strip in some of the various expansion bay device configurations.

What is installed	Strip Icon	Strip Icon on Mouse Down
Two expansion bay devices installed, left device is a battery.		
Battery installed in left expansion bay.		
Battery installed in right expansion bay.		
No expansion bay devices installed.		

When removing expansion bay devices, its important that the device has ejected any media that was being used.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: "**PowerBook G3, G3 Series: Identifying Different Versions**"
Published Date: Feb 19, 2012

PowerBook G3 Series: Infrared Port

What are the features of the PowerBook G3 Series Infrared Port?
This article has been archived and is no longer updated by Apple.
The PowerBook G3 Series (M4753) has built-in infrared that supports two types of transmissions:

- IrDA - up to 4 megabits per second (Mbps) - AppleTalk and TCP/IP
- IRTalk - 230 kilobits per second (Kbps) - AppleTalk Only

Note: PowerBook G3 Series (Bronze keyboard) computers are IrDA compliant but do not support IRTalk.

There are two main differences between IRTalk and IrDA:

1. IrDA is an industry standard, while IRTalk is an Apple-only technology.
2. IrDA supports TCP/IP and AppleTalk, where IRTalk only supports AppleTalk.

The Infrared Control Panel will give information about any Infrared connections that are established as well as what type of infrared the PowerBook is currently set to use. In the window below, IrDA is selected and there are no other Infrared devices in range.

Figure 1, Infrared Control Panel

The options button will present a new window which allows you to select the type of infrared connections you want. You can also select whether or not you are notified if the connection is interrupted. This checkbox will only be available for IrDA and not IRTalk.

Figure 2, Infrared Control Panel Options dialog box

For infrared options to work there are three drivers that must be in the Control Panels or Extensions folder. They are normally installed. They are:

Figure 3, Infrared Control Panel icon

Figure 4, IrDALib Extension icon

Figure 5, IrLanScannerPPC Extension icon

If these are not present or disabled, you will not be able to make infrared connections from the PowerBook.

- If you have used infrared communications with other Apple products, you will notice a difference with this PowerBook. The lens in the rear of the PowerBook has been updated to support IrDA. The new lens has about a 30 degree viewing angle.
- There is also a **maximum** 1 meter distance for recognizing other Infrared devices. Information source, Powerbook G3 series manual, page 47 and product testing.

For more information on IrDA and IRTalk compatibility, see the following article:

Article 20928: "**Macintosh Infrared: Is It IrDA Compatible?**"

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: "**PowerBook G3, G3 Series: Identifying Different Versions**"

PowerBook G3 Series: CD-ROM and DVD-ROM Drive Support

What types of CD-ROM and DVD-ROM drives are supported by the PowerBook G3 Series computer?
This article has been archived and is no longer updated by Apple.
The PowerBook G3 Series (M4753) computer has two different drives available for the right expansion bay, a 20x speed CD-ROM and a 1.5x speed DVD-ROM.

Drive Type	Speed
CD-ROM	20 x
DVD-ROM	1.5 x

DVD Facts:

- CD-ROM discs can be used in DVD-ROM Drives.
- DVD-ROM discs cannot be used in CD-ROM Drives.
- DVD-ROM drives will read CD-ROM discs at the approximate speed of a 12x CD-ROM Drive.
- All DVD discs are formatted with the UDF format, similar to ISO 9660, HFS, or FAT.
- UDF formatted discs are readable because of the UDF Volume Access extension.
- CD and DVD-ROM Drives will only fit in the right expansion bay.

The CD and DVD ROM drives are installed by insertion into the bay until an audible click is heard which denotes that the device is safely in place. The software needed is pre-installed by the system software. There is only one driver needed to use the CD and DVD devices which is a unified driver available only for the PowerBook G3. There are the usual assortment of Foreign File Access modules as well as a new file, UDF Access extension, which allows the new format of DVD discs to be mounted.

All of the following files are installed in the Extensions folder and, as mentioned above, are installed by the system software. If you need to reinstall the drivers, you must perform a custom install of the Mac OS (selecting install the CD and DVD software). There is no single, separate installer for just these files.

Figure 1, Necessary CD/DVD drivers

If the drivers are unusable or missing, you will notice that the discs (CD or DVD act the same) will not mount on the desktop.

If the DVD Drive is installed and you cannot mount a DVD disc, make sure that the UDF Volume Access extension is present and not disabled or missing.

If you cannot mount a DVD disc, but can mount a CD-ROM disc, make sure that you have a DVD-ROM drive installed (eject the drive and look at the top label of the drive for the name), then make sure that the correct software is installed.

DVD-VIDEO discs can be mounted on the desktop. However, the movie files on the discs cannot be played without the combination of an MPEG-2 video decoder and an AC-3 audio decoder.

DVD-ROM drives can be affected by issues that affect CD-ROM drives. These include:

- not closing the door firmly
- seating discs improperly on the spindle
- unbalanced discs which can cause read errors and noise
- scratches and expansion damage cause read errors

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: "**PowerBook G3, G3 Series: Identifying Different Versions**"
Published Date: Feb 19, 2012

PowerBook G3 Series: PC Card

Can the PowerBook G3 Series computer use PC cards?
This article has been archived and is no longer updated by Apple.
The PowerBook G3 Series (M4753) computer has two PC Card slots. Both slots can hold Type I (3.3 mm) and Type II (5 mm) cards, but only the lower slot can hold a Type III (10.5 mm) card. When a Type III PC Card is inserted in the lower slot, the upper slot cannot be used.

The use and installation of PC Cards has not changed from previous models of the PowerBook.

The PC Card slots on the new PowerBook G3 are CardBus slots. This means that they can accept newer 32-bit PC Cards.

The lower PC Card slot has circuitry for handling video signals (zoomed video). Although a zoomed video card is a Type II card, it can only be used in the lower slot.

Zoomed Video
Zoomed Video is a method of displaying video signals sent from a PC card.

CardBus
CardBus is a 32-bit version of the PCMCIA PC Card standard. In addition to supporting a wider bus (32 bits instead of 16 bits), CardBus also supports bus mastering and operation speeds up to 33 MHz. CardBus cards include SCSI, Video in, and Video out (to a monitor) types of cards to name a few.

The slot supports both older 16-bit PC Cards, that work in other PowerBook models, and 32-bit CardBus Cards.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: "**PowerBook G3, G3 Series: Identifying Different Versions**"

Published Date: Feb 19, 2012

PowerBook G3 Series: Optional Internal Modem Features

What are the features of the internal modem included with some of the first generation PowerBook G3 Series computer?
This article has been archived and is no longer updated by Apple.
Note: This article relates specifically to the internal modems that shipped with some first-generation PowerBook G3 Series models. The early PowerBook G3 Series shipped with a version of Mac OS 8.1 unique to this model. Upgrading the OS or running the Apple Modem Updater application may change the modem script selection found in the Modem Control Panel and/or modem related files installed within the System Folder.

An internal modem is included in some of the PowerBook G3 Series (M4753) models. The modem is based on Rockwell's K56 Flex technology. It has upgradeable flash ROMs. If you wish to update this modem to the V.90 standard, there is an updater application available from the Apple Software Updates web site.

What connections speeds can I expect when dialing into a K56 Flex provider?
In testing the modem with some of the national internet service providers, speeds ranging from 44000 bps to 48000 bps were consistently achieved. This is representative of average connections speeds for K56 Flex modems.

Phone line noise and service provider line quality are the two most common issues which can cause lower connect speeds with 56k modems.

Where do I plug in the phone line?
Unlike the PowerBook 3400 and PowerBook G3, the PowerBook G3 Series computer has a separate dedicated modem port on the left side of the unit.

The window below shows the correct modem script selected for the internal 56k modem.

Figure 1, Modem control panel

What drivers are necessary to use the modem?

The PowerBook G3 Series Modem Extension is needed for using the internal modem. The PB/GV Internal 56 file is an AppleTalk Remote Access modem script and is optional when not using OT/PPP or ARA (2.1 or greater).

Figure 2, PowerBook G3 Series Modem Extension icon

Figure 3, PowerBook/GV Internal 56 icon

How to tell if the modem is K56 Flex or V.90?
You should launch some type of communications application such as ZTerm or ClarisWorks and type the following command: ATI3
(for more information on how to perform this in ClarisWorks, click here)

You will get a response from the modem that will show whether or not it is still K56 Flex or has been upgraded to V.90. For example, you may see:

```
A811-K56_DLS v1.200_CS
```

This particular string indicates that the modem is still K56 Flex.

Where can I get a list of the AT Commands?

A PDF document containing the complete AT Command list is included on the the System Software CD.

In some documentation, the modem is called an Apple/GV. Although this may imply that the modem is a Global Village modem, Apple provides all support, service, and driver updates for this modem.

Note: This article mentions an Apple software update. You may search for software updates in Apple Downloads at following URL:
http://www.apple.com/downloads

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: "**PowerBook G3, G3 Series: Identifying Different Versions**"

Published Date: Feb 19, 2012

PowerBook G3 Series: Hard Drive Format

What is the hard drive format used on the PowerBook G3 Series computer?
This article has been archived and is no longer updated by Apple.
The PowerBook G3 Series (M4753) computer's hard disk uses a new, improved file format called Mac OS Extended format (sometimes called HFS Plus). Mac OS Extended format has two benefits:

- it increases the number of files you can store on your hard disk
- it lets your computer work with data more efficiently than previous formats.

Using Norton Utilities
Norton Utilities version 3.5.1 and earlier is not compatible with Mac OS Extended format. If you experience issues with your hard disk, Apple Computer recommends using the disk utility Disk First Aid, which is included on your system software CD.

Warning - Using Norton Utilities version 3.5.1 or earlier on your hard disk can result in hard disk corruption and loss of all your data.

See the Symantec Web site for more information on Norton Utilities and Mac OS Extended format.

Using Other Hard Disk Utility and Disk Locking Programs

Some other disk utility and disk locking programs manufactured by companies other than Apple are incompatible with Mac OS Extended format. Before you attempt to use another manufacturer's disk utility or disk locking program, make sure the version you have is compatible with Mac OS Extended format. Check the documentation that came with the program or contact the manufacturer or the vendor from whom you purchased the program.

Using SCSI Disk Mode (PowerBook Computers)

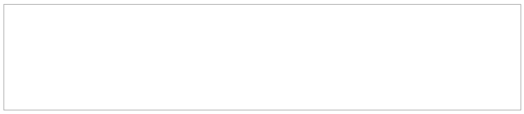
To use your PowerBook in SCSI disk mode, the computer you are connecting your PowerBook to must have Mac OS 8.1 or later installed. If the computer has an earlier version of system software, you will not be able to see the files on your PowerBook's hard disk.

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: "**PowerBook G3, G3 Series: Identifying Different Versions**"
Published Date: Feb 19, 2012

PowerBook G3 Series: Apple System Profiler

What information will I see in the Apple System Profiler on the PowerBook G3 Series computer?
This article has been archived and is no longer updated by Apple.
The PowerBook G3 Series (M4753) is shipping with a new version of Apple System Profiler. The new version supports the reading of serial number and software bundle numbers from the hard disk configuration. This data is stored in the hard drive and will remain there until you perform a low-level format of the hard disk drive.

Here is a closer view of the serial number and software bundle number. This data should also help correlate the machine's configuration with the user's proof of purchase.



If this data is not there or says not applicable (as it does above). This means that the user has done a low level format of their hard drive. There is no harm to losing the information here. It does not affect the warranty or support.

Here is the report generated by Apple System Profiler 1.4 on a PowerBook G3 Series M6477LL/A.

Report Generated: Sat, Aug 2, 1913 at 7:55 AM

PowerBook G3 Series: About This Computer

What information should I expect to see in the About This Computer window?
This article has been archived and is no longer updated by Apple.
Here is the **About This Computer** window on a PowerBook G3 Series computer.

Figure 1 About This Computer window

It shows that the unit ships with Mac OS 8.1 running the PB G3 Series Enabler 1.0

Note: Macintosh PowerBook G3 Series computers should not be confused with Macintosh PowerBook G3 computers. Though the names are similar, there are significant differences. For more information differentiating between the computers, read article 24604: "**PowerBook G3, G3 Series: Identifying Different Versions**"

What is the Status of Claris Organizer and ClarisWorks?

This article provides the status of Claris Organizer and ClarisWorks.
This article has been archived and is no longer updated by Apple.

Claris Organizer

Apple has acknowledged the sale of Claris Organizer to 3Com's Palm Computing subsidiary. Palm will use the product as a part of its MacPac connection solution for Palm computers. Full details are available at: **http://www.palm.com**.

Apple continues to offer technical support for all Claris-labeled versions of the product. Consult the materials that came with your copy of Claris Organizer for details on how to obtain technical support. You may also wish to consult Apple's discussion area at http://discussions.apple.com/.

3Com/Palm will support future versions of the product published under their label.

ClarisWorks

ClarisWorks has been rebranded as "AppleWorks" and is bundled with some Apple products. Consult the materials that came with your copy of ClarisWorks or AppleWorks for details on how to obtain technical support.

LaserWriter Family: Adjusting Default Timeout Values

The following information discusses LaserWriter timeouts and the defaultvalues of these timeouts.
This article has been archived and is no longer updated by Apple.
The LaserWriter family has three types of "timeouts" that cancel an existing job on expiration:

- Job timeout: duration time of the job.
- Feed timeout: time allowed to manually feed the paper.
- Wait timeout: time the printer waits for additional input on the current job.

The following table contains the default values of these timeouts; a PostScript program can be used to change the defaults for a current job, if necessary (see below).

LaserWriter	Job Timeout	Manual Feed Timeout	Wait Timeout
LaserWriter	0 (never)	60 seconds	30 seconds
LaserWriter Plus	0 (never)	60 seconds	30 seconds
LaserWriter Plus (Rev. 47 ROMs)	0 (never)	60 seconds	40 seconds
LaserWriter IINT/IINTX	0 (never)	60 seconds	40 seconds
LaserWriter IIf/IIg	0 (never)	60 seconds	300 seconds
LaserWriter Pro 600/630	0 (never)	60 seconds	300 seconds
LaserWriter Pro 810	0 (never)	60 seconds	40 seconds
Personal LaserWriter NT	0 (never)	60 seconds	300 seconds
Personal LaserWriter NTR	0 (never)	60 seconds	300 seconds
Personal LaserWriter 320	0 (never)	60 seconds	300 seconds
LaserWriter Select 360	0 (never)	60 seconds	300 seconds
LaserWriter Pro 16/600PS	0 (never)	60 seconds	300 seconds

Note:
Appendix D of "PostScript Language: Reference Manual", available from Addison-Wesley (ISBN# 0-201-10174-2), contains additional information on timeouts and default adjustments.

Changing the timeout is done with the "setdefaulttimeouts" PostScript operator. This operator establishes the default values, job, manual feed, and wait for the three timeouts.

At the beginning of each job, these values are used to initialize the job, manual feed, and wait timeouts. Each parameter must be a non-negative integer denoting the length of a timeout in seconds. The value of 0 indicates that the corresponding timeout should never occur. A PostScript program, like the one that follows, can be sent to the printer to change timeout values.

Caution:

If you choose to use the PostScript code provided in this article, you assume all risks involved in making these changes. PostScript code, if not entered correctly, can place the LaserWriter into a condition requiring service.

```
%=============================================
% Begin PostScript Code
%
serverdict begin 0 exitserver
statusdict begin
# # # setdefaulttimeouts
end
%
% end PostScript Code
%=============================================
```

where # # # should be replaced by the job, manual-feed, and wait-timeout values in seconds. For example, if you want to change the manual-feed timeout of the LaserWriter IIg to 120 seconds and keep the other values at their default setting, the PostScript program should look like this:

```
%=============================================
% Begin PostScript Code
```

```
%
serverdict begin 0 exitserver
statusdict begin
0 120 300 setdefaulttimeouts
end
%
% end PostScript Code
%═══════════════════════════════════════════
```

The PostScript program then can be downloaded to the printer using the LaserWriter Utility 7.1 (or later).

HSV-To-RGB Mapping and Color Models (Part 1 Of 2)

A two-part article on HSV-to-RGB mapping and color models.
This article has been archived and is no longer updated by Apple.
There are several color models for color monitors. The most common are:
- HSV
- HSL (synonymous with HIS)
- CMY
- RGB
- YIQ

Note: The Color Picker Package defines parameter values from 0 to 65535 for each of these models.

The Macintosh II Color Picker Package uses the RGB, CMY, HSV, and HSL models. Each of them is described below.

The RGB and CMY Models (Red-Green-Blue and Cyan-Magenta-Yellow)
The RGB model defines its colors as mixtures of the additive primary colors: red, green, and blue. The RGB model organizes colors into a three-dimensional cube. Differing values of red, green, and blue define the model. (The human eye can see all visible colors in combinations of three base colors.)

The CMY model features cyan, magenta, and yellow values. These are the subtractive (or complementary) primary colors. The model works in the same manner as the RGB model--that is, a three-dimensional cube is fashioned with the three color values.

The association between RGB and CMY is one-to-one: cyan is the complement of red, magenta the complement of green, and yellow the complement of blue. A color defined in values for red, green, and blue in the RGB model is defined in values of cyan, magenta, and yellow in the CMY model. For conversion purposes, each of these two models is the other's complement.

For example, given a maximum value of 65535 and a minimum value of 0, a pure red color in the RGB model containing 65535 red, 0 green, and 0 blue has a CMY color of 0 cyan, 65535 magenta, and 65535 yellow.

The HSV Model (Hue-Saturation-Value)
The HSV model appears as a color cone. The three parameters describing this cone are hue, saturation, and value.

"Hue" - describes the primary attributes of a color. A color hue for purple has both red and blue primary attributes or hues. A given purple may contain more blue than red; therefore, the hue of that purple is blue.

"Saturation" - is a value measuring the amount of mixing between primary colors like red, green, and blue. A fully-saturated red contains only the color red and has no other primary color attributes; that is, no mixtures of blue or green. Colors that are slightly or minimally saturated contain mixtures of the primary colors and might contain red, green, and blue. A color that has no saturation at all is white. In the HSV model, the primary colors appear along the edges. They mix toward the center, growing lighter in hue and becoming less saturated as they near the center. The center is white, and contains equal amounts of all the colors.

"Value" - describes the brightness of a color. A red can be made brighter or darker by adjusting its value. A white in the center of the HSV model becomes darker, grows to gray, and finally becomes black if followed along the center of HSV model to its point.

The HSV model is a single-cone shape based on the coordinate values of hue, saturation, and value. Colors are mixed within the cone and appear as primaries along the edges, spaced every 60 degrees. The colors following green on the perimeter, are yellow, red, magenta, blue, cyan, and back to green (or the reverse, depending on direction around the cone). The color white is anywhere on the center line of the cone where all the colors are mixed evenly, and the value or brightness is at a high level.

In the HSV model, the apex describes the lowest intensity level, and the base describes the highest intensity level of a color. Points within the cone are colors made up of mixtures of hue and saturation. A color's intensity is the point's distance above the base.

Visualize a cone with a hexagon just fitting the mouth of the cone. In this cone, these edges represent the primary colors. The center of the hexagon is a white wire with one end at the tip of the cone. The wire, while white at the wide end or base, grows more gray as it recedes to the tip, where it at last becomes black.

The HSL (Hue-Saturation-Luminance)
The HSL (or HIS, hue-intensity-saturation) model is a double cone with the bases connected. It follows the same parameters as the HSV model, but the colors filling the base and sides have values rising and falling to each apex of the cones. The apexes are defined as the brightest color point (white) and the lowest color point (black)--similar to the HSV model, where the apex gradually darkens, and all colors fade to black. However, in HSL the colors fade to black AND white. The colors rise in value, becoming brighter, but are also brought closer together by the angle of cone's surface toward the white center. This model is used in Tektronix display devices.

"Intensity" and "luminance" both define the strength or brightness of a color. This is like the "value" parameter of the HSV model, but is defined with the brightest primary color values occurring in the center of the model instead of at one end. The colors could become brighter near the white point, but lose their identity when they mix with other colors as they approach the white apex.

To model HSL/HIS, two cones are connected to make a hollow shape with the hexagon sandwiched inside. The lines extending from the points on the hexagons connect to the points on both cones.

Note: This article is continued in Article 2992: **HSV-To-RGB Mapping and Color Models (Part 2 Of 2)**
Published Date: Feb 20, 2012

HSV-To-RGB Mapping and Color Models (Part 2 Of 2)

The second of a two-part article on HSV-to-RGB mapping and color models.
This article has been archived and is no longer updated by Apple.

Converting from RGB to HSV or HIS

When converting HSV to RGB, the HSV model always has at least one RGB value equaling the intensity or value of the HSV model color.

When converting HSV to RGB, the HSV model sets the value parameter to the largest RGB value.

When converting RGB to HSL/HIS, the HSL model always sets the luminance or intensity parameter to equal the midrange of the RGB values.

The hue values for the HSV model always equal the hue values from the HSL model.

References

"Raster Graphics Handbook" Conrac Division, Conrac Corporation Van Nostrand Reinhold Company Inc.
135 West 50th Street
New York, New York 10020

"Fundamentals of Interactive Computer Graphics" James D. Foley, Andries
Van Dam, Addison-Wesley Publishing Company Menlo Park, CA

For the HSL model (also called HIS), both books use "Status Report of the Graphics Standards Committee," Computer Graphics volume 13, number 3, Association for Computing Machinery, New York, August, 1979.

The HSL model provided in both books is based on the SIGGRAPH article. There is a typographical error in the calculation for converting from RGB to HSL. This error appears in the article and is replicated in the books.

The correct calculation for color saturation from red, green, and blue values is:

```
If luminance <=.5 then
  saturation := (max - min) / (max + min)
else
  saturation := (max-min) / (2 - min - max)
```

Apple, Inc. uses the corrected calculation in its Color Picker Package.

DVD Studio Pro: Update your DVD@ccess to fix a hang or no-launch issue with Windows XP

This article has been archived and is no longer updated by Apple.
A new update to DVD@ccess, software used with DVD Studio Pro and discs produced by it, can fix these issues:

- The DVD@access 2.0 Installer on Windows XP will not launch DVDaccess.exe on start-up.
- When you Log Off Windows XP with DVD@ccess active, the computer may become unresponsive ("hang"), displaying only a blue screen.

This affects users who have not upgraded to DVD Studio Pro 3 who are authoring discs that include DVD@ccess links.

Who needs this update

- Macintosh users who are authoring DVDs containing DVD@ccess on a version prior to DVD Studio Pro 3. The DVD@ccess.exe file is what gets written to your DVD in order for Windows users to have access to DVD@ccess functionality.
- Windows users who receive a disc containing DVD@ccess Links that was authored in a version prior to DVD Studio Pro 3

Getting the update

Click here to download the DVD Access Update.

Installing the update

Mac OS:

1. Download the DVD@ccess.exe file.
2. Control-click the DVD Studio Pro Application icon, and choose **Show Package Contents** from the shortcut menu.
3. In the window that appears, navigate to: Contents/Resources/DVDccess
4. Copy DVD@ccess.exe into the DVDccess folder. If it asks you if you want to replace the existing DVD@ccess file, click Replace.

Windows:

Before installing, uninstall the existing DVD@ccess.exe using the Add or Remove Programs control panel.

Note: If you do not have a previous version of DVD@ccess installed, skip to Step 6.

1. From the **Start Menu**, choose **Control Panel**.
2. Double-click the Add or Remove Programs icon.
3. Highlight DVD@ccess 2.0, and click the Change/Remove button.
4. Click Yes in the dialog that asks, "Are you sure you want to completely remove 'DVD@ccess 2.0' and all of its components?"
5. Click "Yes, I want to restart my computer now."
6. Double-click the newer DVD@ccess.exe that you downloaded.

Logic Pro 7: Audio file is distorted after Digital Mixdown

This article has been archived and is no longer updated by Apple.
After merging some audio Regions in the Arrange window using either the Glue tool or choosing the Region > Merge > Region menu option, the level of the resulting audio file is about 6dB higher than before. When using the bounce function, the level stays the same.

This happens when a stereo audio file is played back on a mono audio track. When playing back a stereo file on a mono track, Logic Pro automatically adapts the level. Thus, bouncing results in a corrected level. When using Digital Mixdown for a stereo file on a mono track, the stereo file will be converted into a mono file. This means that the level of the left and the right channel are added.

To avoid this when using Digital Mixdown, make sure that the file type (mono/stereo) matches the track setting. Alternatively, you can use the bounce function to merge stereo audio Regions into a mono file.

FireWire volumes and Logic Pro‘s Project Manager

This article has been archived and is no longer updated by Apple.
If you scan a FireWire volume with Logic Pro's Project Manager and connect the drive to another computer, you don't need to scan the volume again.

After connecting the volume:
Choose Edit > Import file maps from the local menu of the Project Manager.

Why does this work?
When scanning a volume with the project manager, a filemap is created in the root directory of the scanned volume. The data is stored as a hidden file named ".Logic PM Database" in Mac OS X (this is also the case with internal volumes). The function Edit > Import file maps from the local menu of the Project Manager reads this file and provides the Project Manager data for the volume immediately.

Logic Pro 7: Strange characters in EXS24 instrument menu

This article has been archived and is no longer updated by Apple.
Some Sampler Instruments or subfolders for the EXS24 show unexpected names in the Sampler Instruments menu, such as "6 String Bass Guitar P#CDF1.EXS".

The EXS24 can display up to 31 characters, including the file name extension. Longer names will be shortened in the display, and a hexadecimal number is added in order to prevent duplicate names.

While the instrument will still work, you can prevent this by renaming the file or folder in the Finder, making sure not to use more than 31 characters, including the .exs file extension.

This document will be updated as more information becomes available.

Published Date: Feb 19, 2012

Logic Pro 7: ReWire stream stutters in cycle mode

This article has been archived and is no longer updated by Apple.
When a Logic Pro song runs in cycle mode, audio streams of a ReWire slave application stutter or stumble each time the Song Position Pointer jumps back to the start of the cycle.

This issue only occurs when the cycle starts at bar 1. If the cycle start is set to bar 2, the audio playback loops smoothly. In order to prevent this:

1. Move the song content to bar 2.
2. Set the cycle to start at bar 2.

This document will be updated as more information becomes available.

Logic Pro/Express 7.0: "Some Text Fonts Are Missing" message

This article has been archived and is no longer updated by Apple.
When Logic Pro and Logic Express start up, you get the alert message "Some Text Fonts Are Missing." The software still works properly, but some text fonts may not be available.

Logic 7.0 can handle up to 253 fonts. This refers to the total of fonts in the System and user Font folders. The fonts are loaded in alphabetical order, and no fonts after number 253 will be available.

Click here for more information on Font locations.

This issue is resolved in Logic Pro/Express 7.1, because there is no longer a limit on the number of fonts Logic can use.

Regardless of the Logic issue, you might also consider managing your fonts with a utility such as Font Book or third-party font management software.

Before upgrading to Logic 7.1, another workaround is to create a new user account for working with Logic, making sure the total number of fonts for this user is less than 253.

Published Date: Feb 19, 2012

Logic Pro 7: Short dropout in monitor signal after Punch Out

This article has been archived and is no longer updated by Apple.
If the Replace button in the Transport Window is active, there may be a short dropout in the monitor signal after "punching out" a recording.

Specifically, it happens when the Replace button in the transport window is active and the recording is punched in and out with the key command for Toggle Record. The monitor signal then drops out for an instant as soon as the recording is ended (punch out).

Because the issue affects only the monitor signal, the audio is recorded correctly. It only occurs if the Replace option is active when record is toggled manually. It does not occur when using the Auto Drop function together with Replace.

To avoid the drop out of the monitor signal, disable Replace in the Transport Window. This will record the audio without replacing the old parts of the track. The newly recorded audio Regions will be placed above the old ones in the Arrange Window, resulting in only the new audio regions being played back. If needed, the sections of the previous recording can be removed manually or using the "No Overlap" mode from the local Drag menu.

Published Date: Feb 19, 2012

Logic Pro 7: Audio Instrument does not play

This article has been archived and is no longer updated by Apple.
When playing an Audio Instrument with the MIDI keyboard, you hear no signal. Logic Pro's Transport window reflects the MIDI input, but the mixer channel does not show any level.

A workaround is to start the playback. After that, the Audio Instrument can be played as usual.

This document will be updated as more information becomes available.

Published Date: Feb 19, 2012

Logic Pro 7: Freeze files will not play before the first bar

This article has been archived and is no longer updated by Apple.
After using the Freeze function, all material that was located before bar 1 will not play.

Symptom

If the song start is set before the first bar, and a track containing regions before bar 1 is rendered with the Freeze function, then the material before bar 1 remains silent when playing back the song.

Solution

Set the song start to bar 1 and move all regions to a later position.

This document will be updated as more information becomes available.

Logic Pro 7: AudioSuite plug-in windows cannot be closed

This article has been archived and is no longer updated by Apple.
Digidesign AudioSuite plug-in windows are missing the usual buttons for closing the window.

Symptom
When using Digidesign AudioSuite plug-ins on a Digidesign TDM system with Logic Pro as the front-end application, the plug-in windows are missing the usual buttons for closing the window and therefore cannot be closed using the mouse.

Solution
For Logic Pro 7.0, use the keyboard shortcut Command-W to close AudioSuite plug-in windows.

The issue has been resolved in Logic Pro 7.1 or later, in which the buttons are available.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Logic Pro 7: Don‘t use special characters for filenames during OMF export

This article has been archived and is no longer updated by Apple.
When exporting an OMF file from Logic Pro, an alert says:

"An OMF error has occurred. Error code 18. Description: OMFI_ERR: Cannot open File"

The export is then cancelled.

This happens when the file name contains an umlaut or another special character. The OMF library does not support these characters. Check your filename for special characters and use a different filename for the OMF file.

Logic Pro 7: "Error while Trying to Synchronize Audio and MIDI" with 48kHz

This article has been archived and is no longer updated by Apple.
After switching the sample rate for DAE to 48kHz, you get this message each time the playback is started:

"Error while Trying to Synchronize Audio and MIDI. Sample Rate 48000 recognized"

This happens because the sample rate was changed to 48kHz within the Digidesign Hardware Setup panel in the local options menu of the Audio window. This changes the sample rate of the TDM hardware but does not change the sample rate in Logic Pro as the front-end application. So, Logic Pro still expects a sample rate of 44.1kHz while the audio hardware is running at 48kHz.

To prevent this, the sample rate must always be changed within Logic Pro via the menu Audio > Samplerate ... or within the audio window via Options > Sample rate. This will change the sample rate for Logic and DAE.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Logic Pro 7: Using MIDI keyboard with fast user switching

This article has been archived and is no longer updated by Apple.

Logic Pro is fully supported with fast user switching in Mac OS X 10.3. However, only one account can access a MIDI interface at a time. This means that notes you play on an external keyboard may play the software synthesizer of account (A) instead of the current user (B). To remedy this, switch to account A, quit Logic Pro, and switch back to account B.

Logic Pro 7: A track imported from an audio CD contains only noise

This article has been archived and is no longer updated by Apple.
A track that has been imported from an audio CD into Logic Pro contains only noise.

Symptom
When listening to an audio file, the file contains only noise.

This happens when you have added a track directly from an audio CD into Logic Pro using the "Add Audio File" dialog. You then copied the track to the hard drive using the "Copy/Convert Audio File(s)" function in the local Audio File menu of the Audio window.

Solution
This issue only occurs when saving the audio file from within Logic Pro in AIFF format. It does not occur with the WAVE or SoundDesigner II file format.

To avoid this, you should first copy the CD track to your hard disk in the Finder, and then import it into Logic Pro from there. In this case, the AIFF file format can be used.

If you have already imported the track directly from CD into Logic Pro, then set the file format in Logic Pro's Copy/Convert dialog to "WAVE" or "SoundDesigner" when saving the track to the hard disk.

You can resolve the issue by upgrading to Logic Pro 7.1, in which you can now copy/convert audio files imported from CDs as AIFF.

Logic Pro 7: Startup modifier keys

This article has been archived and is no longer updated by Apple.
By holding down modifier keys during application launch, you can put Logic Pro in one of several troubleshooting modes.

To do that, just double-click the Logic Pro application icon, then hold down the respective modifier key(s) until a dialog pops up or Logic is fully loaded.

Modifier key(s)	Description	Purpose
Control	Start without Audio	This can be helpful to rule out problems with a specific Core Audio driver. In some cases, Logic Pro may stop responding or quit unexpectedly while initializing the Core Audio driver. In these cases, start Logic Pro without Audio. If needed, turn on Built-In Audio for the troubleshooting.
Shift-Control	AU-Safe Mode	This will only load Audio Units that have passed the Audio Units Validation Tool which is automatically launched on the very first startup of Logic Pro. If you have enabled Audio Units which did not pass this test, you may experience unexpected quitting or misbehavior. With this option, you may revert Logic Pro to a stable state.
Command	"Please enter your activation code" Dialog	This brings up the XSKey dialog which allows you to enter an XSKey activation code which was delivered with the upgrade to Logic Pro 7. If you did not enter your activation code when you first started Logic Pro, you can enter it by using Command as a startup modifier key.
Shift-Command	"Manual Authorization" Dialog	This brings up the XSKey dialog which allows you to enter an XSKey authorization code and shows the XSKey number. If you have no Internet connection on the computer with Logic Pro, you must get an authorization code manually. An authorization code can be retrieved from here or from an AppleCare representative.
Option	Start without Autoload/Template/LastRecent	This will start Logic Pro without loading a Template, Autoload or last opened Song. It is useful for troubleshooting any kind of issue as it excludes the possibility that the reason for a problem is specific to or caused by the currently loaded song. Choosing File > New with the Option Key held down will load a plain empty default song for troubleshooting.

Logic Pro 7: Folder content keeps playing outside of folder

This article has been archived and is no longer updated by Apple.
The content of a folder keeps playing if it exceeds the length of the folder.

When shortening a folder, the content's playback will not be cut at the folder's end. In a folder, a MIDI note or an audio file will be played in whole, even if it exceeds the folder length. This only affects MIDI notes or audio files that start within the folder limits.

There are two workarounds, cutting the content at the folder's end or cutting the folder.

Workaround 1: Cut the content at the folder's end

1. Select the folder.
2. From the local menu, choose **Region** > **Set Locators by Region**.
3. Double-click the folder to open it.
4. Select all regions.
5. From the local menu, choose **Region** > **Split/Demix** > **Split Regions by Locators**.

Note: When splitting MIDI regions, overlapping notes will be shortened or split destructively. If you re-extend a folder after splitting a contained MIDI region, these notes will remain split or shortened.

Workaround 2 (applicable only to folders which contain only audio files): Cut the folder instead of resizing it.

Logic Pro 7: No panorama information in the send signal

This article has been archived and is no longer updated by Apple.
An audio signal routed via Send to a Bus remains unaffected by the pan setting of the Track.

When an audio track is panned hard left or right, the signal that is routed via a Send to a Bus does not reflect the original panning of the track. The signal is always sent as if it was panned to the center. Sends are always routed pre-pan (before the pan pot). Therefore the panning of the audio track does not affect the panning of the Send signal. This does not mean that stereo sends are mono. They carry a real stereo signal, but they don't reflect the panorama setting of the main audio track.

You can modify your routing in order to achieve post-pan sends as follows:

1. Route the output of the audio track to a Bus, and use this Bus as the input for an Aux object as shown below in Figure 1. In our example, we route the signal from Audio 1 via Bus 1 to Aux 1 (1).
2. Aux objects have their own sends which allow to send the signal to another Bus. Use the Send of the Aux object to send the signal to the Bus where your effect plug-in resides. In our example, we use Bus 10 for the reverb plug-in Space Designer (2).

Figure 1 The routing for post-pan Sends.

As the level meters in the picture show, the panning of the Audio track is now reflected in the send signal from the Aux track to the effect Bus. Please be aware that in this setup the panorama must always be adjusted in the Audio track, not in the Aux track, because the Aux track's Send is again pre-pan.

Logic Pro 7: Undo after step input deletes region

This article has been archived and is no longer updated by Apple.
When using step input in a newly created region, the Undo command may delete the region instead of the events under certain circumstances.

After creating an empty region, notes are created via step input within the Matrix Editor (applies for other editors as well). If the last input should be undone using the Undo command, the region will be deleted. An empty Matrix Editor is visible, and no events can be input anymore.

To prevent this, delete the unwanted events by selecting them and pressing the Backspace key.

This document will be updated when additional information is available.

Logic Pro 7: Instruments open up in Controls view after double-clicking

This article has been archived and is no longer updated by Apple.
When double-clicking an instrument in the Input slot, the plug-in opens in the Controls view instead of the Editor view.

This can happen after dragging a software instrument loop (e.g. "70s ballad drums") from the Loop Browser onto an Audio Instrument track.

When this happens, switch to Editor view manually via the Editor menu at the top of the plug-in window.

Published Date: Oct 7, 2016

Logic Pro 7: Nodes could not be found or failed to connect

This article has been archived and is no longer updated by Apple.
Even though the computers are switched on and connected to gigabit Ethernet with the Logic Node application running, some Logic Nodes may not be found on the network.

When starting Logic Pro or relaunching the audio driver, you get one of these messages:

- "The following selected node failed to connect: nodename" followed by the node name, or
- "None of the selected Nodes could be found on the network."

There are several possible causes for this, so you need to review each of the following to determine which affects your configuration.

The Computer's name contains a special character

When the node computer's name contains a special character such as an apostrophe or an umlaut, it may not be found on the network. Please make sure the computer names of node computers contain only alphanumerical characters.

To change the computer name:

1. From the **Apple Menu**, choose **System Preferences**.
2. From the **View** menu, choose **Sharing**.
3. Change the name in the Computer Name field.
4. Quit System Preferences.

It may also be necessary to delete this file before connecting to the node:

~/Library/Preferences/Logic/com.apple.LogicNodes.plist

A Firewall is active on the Node computer

If a Firewall is active on the Node computer, the Node cannot be found because the port for the Node connection is blocked. Node computers cannot have an active Firewall.

To turn off all Firewalls off on the Node computer:

1. From the **Apple Menu**, choose **System Preferences**.
2. From the **View** menu, choose **Sharing**.
3. Click FireWall.
4. Click the Stop button.

The Node computer is in sleep mode

Node access does not wake up the Node computer from sleep mode. This may happen when Logic has not been running on the Logic master computer for a while. Either keep Logic running when nodes are connected, or set the sleep mode for the Node computer to Never in System Preferences.

To set the sleep mode:

1. From the **Apple Menu**, choose **System Preferences**.
2. From the **View** menu, choose **Energy Saver**.
3. Click Sleep, and drag the top slider to Never.

Node not available

If a Node is set in Logic Pro > Preferences... > Audio > Nodes, then Logic Pro will try to connect to this Node at every start. If the Node is not available (either because the computer is down or the Logic Node application has been quit or not yet started), then you will see this alert.

The solution in this case is to Start the Logic Node application on the corresponding computer or remove it as a Node in the preferences.

This document will be updated as more information becomes available.

Logic Pro 7: Apple Loops cannot be exported as new audio files

This article has been archived and is no longer updated by Apple.
The "Convert Regions to new Audio Files" function does not work with Apple Loops.

Nothing happens when you select an Apple Loop in the Arrange window and choose "Convert Regions to new Audio Files" from the local Audio menu. No new audio file is created, and no alert appears.

This function currently only works for normal audio regions, not for Apple Loops.

If you need to convert an Apple Loop
In order to convert an Apple Loop into a new audio file while preserving the transpose and tempo settings of the current song, use the function:

File > Export > Region as Audio File...

Note: This will export the Apple Loop as a new audio file but will apply all plug-in effects that have been inserted into the track where the Apple Loop resides. To export the Apple Loop without these effects, bypass them before exporting the Region. To bypass a plug-in, click the plug-in insert slot while holding down the Option key. The new audio file isn't automatically added to Logic Pro's Audio window. To use it in your song, drag it from the Finder to the Arrange or Audio window.

This document will be updated as more information becomes available.

About the Mac OS X 10.3.6 Update (Delta)

This article has been archived and is no longer updated by Apple.
This software updates Mac OS X 10.3.5 to version 10.3.6. **Tip**: If you have version 10.3, 10.3.1, 10.3.2, 10.3.3, or 10.3.4, update with the combo update instead.

Important: Read Before Installing

- You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.
- The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.

Installation

There are two ways to update to Mac OS X 10.3.6, Software Update or standalone Installer. You only need to use one of these methods to update.

Automatic Software Update

Software Update, located in System Preferences, can automatically download and install the latest Apple software. Software Update may have linked you to this document for additional information about the update.

This update's size may vary from computer-to-computer when installed via Software Update.

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

Two versions of the Installer are available from Apple Downloads as a standalone update that you can use without being connected to the Internet.

- A "delta" that updates Mac OS X 10.3.5 to 10.3.6 (described in this document), and
- A "combo" that can update any version 10.3, 10.3.1, 10.3.2, 10.3.3, 10.3.4, or 10.3.5 to 10.3.6.

This type of update, particularly the combo, is useful if you have multiple computers to update and only want to download 10.3.6 once.

Enhancements

These are some of the enhancements included with the Mac OS X 10.3.6 Update.

Internet and .Mac

- Resovles an issue in which Safari might not load webpages correctly when the hard drive name included a non-ASCII character such as a symbol, diacritical, or two-byte character.
- Safari no longer times out after 60 seconds when attempting to connect to a webpage or to submit form data. With this update, Safari will keep trying indefinitely (or until you cancel the attempt).
- With this update, a synchronized iDisk correctly resizes .Mac storage after its allocation changes.
- Addresses a kernel panic issue that could occur when using an external, wireless USB broadband modem with Mac OS X 10.3.5.

Networking

- Improves AFP service performance.
- Addresses a situation in which a file name change that occurred on a server while a client was running Terminal resulted in the client Terminal's failure to recognize the change.
- Addresses an issue that could prevent login via a network user account.

- Resolves an issue for Mac OS X 10.3.5 in which, sometimes, network-based applications could not open an application from an automounted AFP volume, such as /Network/Applications/.
- SMB/CIFS servers in /Network no longer suddenly disappear and reappear after the network changes.

Applications

- Addresses an issue that could occur when using some scholastic information management applications with Mac OS X 10.3.5; this alert could appear: "*Another module has 'locked' the MS Tx file. You will gain access when their task is completed.*"
- Addresses an issue in which "zooming" in Halo 1.0.5 could lead to blurry video when using certain Nvidia video cards.
- Many calculating and conversion features within Calculator are improved by this update.
- Addresses an issue in which TextEdit could unexpectedly quit when changing text from Euphermia regular to italic.
- Addresses an issue for Mac OS X 10.3.5 in which Final Cut Pro HD 4.5 could unexpectedly quit.

Other

- Improves ColorSync calibrating for Apple Cinema HD Display (23-inch DVI) displays.
- Resolves an issue in which the display could sometimes remain dark when waking from display sleep (the mouse pointer might appear, but normal function could not be restored) if using Screen Saver password on a portable computer.
- Adds WMC connectivity capability for Nokia 7610 phones.
- Addresses an issue for Mac OS X 10.3.5 in which some glyph fonts, certain "Expert" or "dingbat" fonts, would no longer appear in some applications.
- Resolves a situation in which incorrect characters could show up for some fonts.
- Addresses some issues that could cause Classic to unexpectedly quit when starting up.
- This update makes it easier to scroll through a long list of user names in the login window.
- Includes recent Security Updates.

About the Mac OS X 10.3.6 Update (Combo)

This article has been archived and is no longer updated by Apple.
This software updates Mac OS X 10.3, 10.3.1, 10.3.2, 10.3.3, 10.3.4, or 10.3.5 to version 10.3.6. **Tip**: If you have version 10.3.5, update with the smaller update instead.

Important: Read Before Installing

- You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.
- The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.

Installation

There are two ways to update to Mac OS X 10.3.6, Software Update or standalone Installer. You only need to use one of these methods to update.

Automatic Software Update

Software Update, located in System Preferences, can automatically download and install the latest Apple software. Software Update may have linked you to this document for additional information about the update.

This update's size may vary from computer-to-computer when installed via Software Update.

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

Two versions of the Installer are available from Apple Downloads as a standalone update that you can use without being connected to the Internet.

- A "combo" that updates Mac OS X 10.3 or later 10.3.6 (described in this document), and
- A "delta" that can update Mac OS X 10.3.5 to 10.3.6.

The combo update is useful if you have multiple computers to update and only want to download 10.3.6 once.

Enhancements

What does this update include? Check out the Enhancements section of this document for some details.

This update also includes enhancements delivered with:

Mac OS X 10.3.5 Update
Mac OS X 10.3.4 Update
Mac OS X 10.3.3 Update
Mac OS X 10.3.2 Update
Mac OS X 10.3.1 Update

Mac OS X 10.3: System sleeps after using Fast User Switching

This article has been archived and is no longer updated by Apple.

Do you use Fast User Switching along with the Screen Saver password feature? If so, when the computer wakes from sleep and is switched to a different user, it will probably go back to sleep within a minute.

Don't worry, your computer isn't a "sleepyhead." All you need to do is wake it up again.

Note: This document applies to Mac OS X 10.3 through 10.3.9.

Published Date: Oct 7, 2016

Apple Asia Chinese Language Kit: Questions and Answers

What is AACLK? Is this similar to CLK (Chinese Language Kit)? I understand this is available in Asia. Why can't I purchase it here in the U.S.? I'm having trouble installing CLK and I heard AACLK might work with System 7.6.
This article has been archived and is no longer updated by Apple.
AACLK (Apple Asia version of the Chinese Language Kit) is not a standalone product and not available in the U.S. It is only for purchasers of the localized Chinese system software who want to be able to use the other Chinese (traditional or simplified) at the same time. (Like Chinese language kit, the localized Mac OS is available for Traditional and Simplified Chinese.)

AACLK is not intended for use outside of Chinese countries and hasn't been tested with non-Chinese systems. The AACLK installer will not behave correctly in some scenarios, such as when other LKs are present, on other localized systems, etc. AACLK and CLK are made by cooperating teams at Apple, but for different purposes. In time, they may be combined.

The only way a U.S. customer can get AACLK is to buy the localized Chinese system from a dealer of localized systems and applications, but the cost of the localized system package is much higher than the cost of the U.S. CLK. Like the localized Chinese Mac OS, AACLK is not supported in the U.S.

In terms of CLK 1.0 or 1.1 working with System 7.5.x or 7.6.x, please use the following steps for installation:

Installation

1. Install the WorldScript Updater 1.1 (or select the International Option under Custom Install for System 7.6).
2. Install the Chinese Language Kit version 1.0 or 1.1.
3. Install the Chinese Language Kit Updater to update your software to version 1.1.1

IMPORTANT: Be sure to follow these steps in the order shown.

Logic Pro 7: Latency when playing software instruments

This article has been archived and is no longer updated by Apple.
When playing a software instrument from the MIDI keyboard, you might get undesired delay between actuation of the instrument and the resulting sound from the computer. There are several reasons this might happen.

The audio buffer size is set to a high value
The audio data produced by a software instrument is temporarily stored in a buffer. This audio buffer must be completely filled before it is transferred the sound card and your speakers. The larger the buffer, the longer it takes until you actually hear a sound after pressing a key on your MIDI keyboard.

At a sample rate of 44.1 KHz and an audio buffer of 512 samples, it takes approximately 11ms to fill the buffer, whereas with a buffer size of 256 samples this takes approximately 6ms. These are the theoretically minimal latencies with these buffer settings. The sound card driver, digital/analog conversion etc. may add their bit to this value.

In 6ms sound travels approximately 2 meters. This is a very common distance between live players and monitor speakers. So 6ms seems to be an acceptable and unnoticeable latency.

Latencies below 6ms are barely noticeable when playing an instrument. Thus it's recommended you set the audio buffer size to 256 samples or lower for live playing of software instruments. A larger audio buffer unburdens the CPU and leads to a better performance, but at the cost of a higher latency. Try different buffer settings to find the best value for your personal setup and taste.

The audio buffer size is set in Preferences > Audio... > Drivers > I/O Buffer Size.

The software instrument is processed on a Node
When a software instrument is processed on a Node computer, the audio data has to be transferred to the Node computer and back to the Logic host. This introduces additional latency which is automatically compensated for during playback. When playing live, this latency cannot be compensated for. Switch off the Node buttons of the Audio Instrument tracks you want to play live.

A mastering plug-in can introduce latency
A mastering plug-in, such as the Adaptive Limiter, which works with a large look-ahead, has been inserted in the master output or into the Audio Instrument track. These plug-ins also introduce latency which cannot be compensated when playing live. Disable mastering plug-ins for live playing Audio Instruments.

This document will be updated as more information becomes available.

Logic Pro 7: Tutorial songs and settings missing from the installation DVD

This article has been archived and is no longer updated by Apple.
The Tutorial songs and settings, referred to in the Logic Pro Reference Manual and the Logic Plug-In Reference, are missing from the installation DVD.

The tutorial song and settings are available from here.

1. Double-click "Logic Tutorial Settings Install.pkg" on the disk image to install the setting files for the tutorial song.
2. Copy the Logic 7 Tutorial Song folder from the disk image to your hard disk.
3. Eject the Logic Tutorial disk image, and drag it to the Trash.
4. Open the Logic 7 Tutorial Song folder, and start the tutorial song by double-clicking the Tutorial.lso file.

Note: This is an updated version of the Tutorial Song. If you experienced issues with the previous version (like detuning), please download and install this song again.

Logic Pro 7: Using effect plug-ins with MIDI input

This article has been archived and is no longer updated by Apple.
Learn how to use audio effect plug-ins which have an additional MIDI input, such as Antares Auto-Tune, vocoder plug-ins, or Logic Pro's EVOC20.

Audio tracks don't accept MIDI input, which is why an effect plug-in that has been inserted in an Audio track, Bus, or Aux channel does not respond to MIDI input. Only Audio Instrument tracks accept MIDI input.

To use the MIDI input of these plug-ins, insert the plug-in into the first insert (the instrument insert) of an Audio Instrument track, just as with any other software instrument.

Inserting EVOC as an Audio Instrument

To feed the plug-in with the audio material you wish to process, use the side chain input of the instrument. Put your audio file on an Audio track, and choose this track from the side chain menu in the top area of the plug-in window. In our example we put the file on Audio track 1, so we choose track 1 from the plug-in's side chain menu.

The side chain menu

The side chain track will now be processed by the plug-in, but the original audio signal will still be audible through its Audio track (Audio 1 in our example). To suppress this signal, mute the audio track with the Mute button in the Track Mixer or in the Arrange channel strip. You can also switch the output routing to "No Output." Now select the Audio instrument track, start the playback, and play the vocoder effect with the MIDI keyboard. **Note:** Make sure you do not use the Arrange Track Mute button.

About the Mac OS X Server 10.3.6 Update

This article has been archived and is no longer updated by Apple.
This software updates Mac OS X Server version 10.3.5 to version 10.3.6.

Important: Read Before Installing

1. An administrator account password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If your password must be changed, follow these steps: Choose System Preferences from the Apple menu. Choose Accounts from the View menu. Select an Admin account and click Edit User. Type your current password, and press Return. Change the password, and click OK.

2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install.

4. This update can be installed on non-startup volumes, but that should be done **only** when the current startup volume has already been updated to Mac OS X Server 10.3.6. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are two ways to update to Mac OS X Server 10.3.6: Software Update and Standalone Installer.

Software Update Installation

You may have been referred to this document by Software Update. For more information on this feature, see How to Update Your Software.

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

An installer is also available from Apple Featured Software.

The Mac OS X Server 10.3.6 Update is specifically for updating version 10.3.5. There is also a "combo" installer available, which will update any version 10.3 to 10.3.6.

Remote Installation

If you need to install the update on a remotely located computer, you can do so using either the Server Admin application or the "softwareupdate" command-line tool. Choose the method that works best for you.

Enhancements

These are some of the enhancements that are part of Mac OS X 10.3.6 Server Update:

Open Directory (Directory Services)

- Active Directory Plug-in: Corrects an issue in which some clients received -14987 error when trying to authenticate using Active Directory.
- Active Directory Plug-in: Corrects an issue in which the Plug-in incorrectly displays the UID.

File Services

- AFP: Improves overall AFP performance and scalability.
- AFP: Addresses issue in which the shell is not in sync with filename changes that were performed on the AFP Server. Filename changes made on the server are now correctly reflected in the shell.
- SMB: Addresses issue in which some Windows clients failed when copying large files to an SMB share.
- SMB: Addresses an issue in which, after installing a Windows Hot Fix (http://www.microsoft.com/technet/security/bulletin/MS04-011.mspx>), Windows XP clients would receive the "system can not change password now because 'domain' the domain controller is not available" message when trying to change their password.

Fibre Channel Utility

- FCU: Corrects multiple issues, including correct aggregation of ports with multiple HBAs, properly displaying card status after port configuration on secondary HBAs, and removing unnecessary error messages in the console during launch. Fibre Channel Utility now provides a pop-up menu with a fixed list of allowable Hard Loop ID values.

Other

- Mail Server: Corrects an issue when using CRAM-MD5 of mail clients failing to authenticate while making SMTP connections.
- LDAP: Addresses an issue in which creating a replica does not work if a custom data location is being used.

Mac OS X Server 10.3.6 also includes the enhancements of the Mac OS X 10.3.6 Update.

Published Date: Oct 7, 2016

About the Mac OS X Server 10.3.6 Update (Combo)

This article has been archived and is no longer updated by Apple.
This software updates any version of Mac OS X Server 10.3 to 10.3.5 to Mac OS X Server version 10.3.6. It is a "combo" update that combines enhancements delivered with versions 10.3.1 through 10.3.6. If you already have Mac OS X Server 10.3.5, you may download a smaller update that is not a combo.

Important: Read Before Installing

1. An administrator account password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If your password must be changed, then follow these steps: Choose System Preferences from the Apple menu. Choose Accounts from the View menu. Select an Admin account and click Edit User. Type your current password, and press Return. Change the password, and click OK.

2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install.

4. This update can be installed on non-startup volumes, but that should be done **only** when the current startup volume has already been updated to Mac OS X Server 10.3.6. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

5. If you are updating from 10.3.2 or earlier and use a MySQL database, you must back it up prior to upgrade. See the Additional Information for MySQL section, below.

6. If you are updating from 10.3.2 or earlier and have set up a loginhook, a custom serial port configuration, or have edited the "/etc/ttys" file for other reasons, you will need to back it up prior to installation of this update.This is because a 10.3.3 or later update overwrites the file with a new copy when updating from 10.3.2 or earlier. The new file will set the Xserve's serial port to communicate at 56Kbps. If your serial device cannot communicate at this speed, you must edit this file to reduce the speed.

Installation

There are two ways to update to Mac OS X Server 10.3.6: Software Update and Standalone Installer.

Software Update Installation

You may have been referred to this document by Software Update. For more information on this feature, see How to Update Your Software.

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

An installer is also available from Apple Featured Software.

Mac OS X Server 10.3.6 Update (Combo) updates Mac OS X Server 10.3, 10.3.1, 10.3.2, 10.3.3, 10.3.4, or 10.3.5 to the later version.

Remote Installation

If you need to install the update on a remotely located computer, you can do so using either the Server Admin application or the "softwareupdate" command-line tool. Choose the method that works best for you.

Enhancements Delivered with this update

Many enhancements are delivered with this update. Because this is a combo update, it includes those delivered with earlier 10.3 updates. You can see the individual lists for 10.3.1, 10.3.2, 10.3.3, 10.3.4, 10.3.5, and 10.3.6.

Additional Information for MySQL

Data stored in MySQL databases with the version of MySQL that is pre-installed Mac OS X Server 10.3.2 or earlier must be exported and re-imported in order to be compatible with version of MySQL that is pre-installed on Mac OS X Server 10.3.3 or later, in which a byte-ordering issue is fixed.

As with any upgrade install, you should back up your old data. In this particular upgrade, the following process is recommended to convert the data to the correct byte ordering:

Before the upgrade, use the terminal to export the data from your pre-10.3.3 database:

```
#  mysqldump -p table > backup-file.sql
```

or

```
#  mysqldump  --opt database > backup-file.sql
```

After the upgrade, and after initializing the MySQL database, import the data:

```
#  mysql -p table < backup-file.sql
```

or

```
#  mysql  database < backup-file.sql
```

Logic Pro 7: Apple Loops transpose to the wrong octave

This article has been archived and is no longer updated by Apple.
Transposing an Apple Loop to a higher pitch may result in the Loop being played back at a lower pitch, and vice versa.

Example: If an Apple Loop is transposed to sound 7 semitones higher, it will sound 5 semitones lower instead. So the Loop is harmonically correctly transposed, but not to the intended octave.

Transposing audio material is a technically complicated process which always implies a certain loss in quality. The higher the amount of transposition applied, the higher the quality loss. This is why Apple Loops are always transposed to the smallest possible value.

Keep in mind that the sound quality depends on the actual transposition based on the Apple Loop's original key – not based on the song key which defines the zero line of the Transposition track. For example, if the song key is already 5 semitones above the original key of an Apple Loop, setting the transposition value to +2 will transpose the Apple Loop 10 semitones down, because this is only 5 semitones below its original key (instead of 7 semitones above it).

In the classical European music system, an octave is divided into 12 semitones. As +7 semitones is therefore harmonically equal to -5 semitones, -5 is chosen as the transposition amount in this case. The same happens with other settings: A transposition of -9 will result in +3, and +12 will result in +/- 0.

Logic Pro 7: Tracks are not processed on a Node

This article has been archived and is no longer updated by Apple.

Some tracks which have the Node button activated are not processed on a Node computer.

Although the Node button of some tracks has been activated, the tracks are not processed on the Node computer. This is indicated by the track Node button not turning blue like on other Node tracks.

This could happen for several reasons:

An Audio Instrument with multiple outputs is sent to a Node Audio
Instruments with multiple outputs cannot be processed on a Node. Only mono and stereo is possible. **The Node does not have enough processing power to process the track**
If a track is sent to a Node, a previous check assures that the Node CPU has enough free resources to process this specific track. The result of this check may be distorted under certain circumstances and the Node will not process the track although the resources are available.

Example: A very CPU intensive Audio Instrument like the ES2 is sent to a Node with its polyphony is set to 32 voices, while in your arrangement, the ES2 only uses 4 of these voices (and will in fact only need the CPU performance of 4 voices). The Node will however report that it does not have enough processing power to process 32 ES2 voices, although only 4 will be used. As a result, the track is not sent to the Node.

To avoid this, the polyphony of Audio Instruments which shall be processed on a Node should always be adjusted to the number that is actually used in your arrangement.

The track contains a Spreader plug-in
A Spreader plug-in cannot be processed by a Node prior to Logic 7.1, so if the Spreader plug-in is the last plug-in of a track, the track will not be processed by the Node. In Logic Pro 7.1, the Spreader can be processed by a Node. If you use a mixture of plug-ins that can and can't be processed by a Node on the same track, only the node-eligible plug-ins that come after the last non-eligible plug-in in the channel strip will be processed by the node. For example, if you have a channel strip that contains a Space Designer, an Audio Unit, and then another Space Designer, only the second Space Designer will be processed by the node.

The EXS24 cannot be processed by a node, but Logic DSP plug-ins assigned to an EXS24 track can be. If there are no eligible plug-ins on an EXS24 track, it will not be processed by a node.

Audio Unit plug-ins cannot be processed by a node. However, Logic plug-ins inserted on tracks after any AU plug-ins can be processed.

This document will be updated as more information becomes available.

Logic Pro 7: Use QuickTime DV format to get smooth playback over FireWire

This article has been archived and is no longer updated by Apple.
Logic Pro can send video over FireWire to a video converter or DV camera. If movie playback stutters and some frames seem to be dropped after doing this, then the video may not be in the QuickTime DV format.

This happens because video that isn't QuickTime DV format must be converted in real time before it is transferred to the FireWire DV converter. This conversion is a very CPU intensive task and may lead to dropouts if the processor cannot handle the stream in real time.

Thus movies output to a FireWire video converter or a DV camera must use the Quicktime DV format. Use iMovie or Quicktime Pro to convert the movie to the appropriate Quicktime DV format for the converter or DV camera you are using.

iSync, iPod: Last day of recurring iCal event not sent to iPod

This article has been archived and is no longer updated by Apple.
Transferring an iCal calendar to your iPod or iPod Mini via iSync?

If the last day of a recurring event in the calendar doesn't show up on the iPod afterwards, you can follow a couple of easy steps:

1. Delete the calendar from the Calendars folder of the iPod. Do this when the iPod is available in Disk Mode.
2. Export the calendar directly from iCal to the iPod Calendars folder.

This document will be updated as more information becomes available.

Logic Pro 7: How to create an upbeat in the Score Editor

This article has been archived and is no longer updated by Apple.
Learn how to manually create an upbeat in the Score Editor.

MIDI regions are normally created at the beginning of a bar. If you want to create an upbeat, the MIDI region will have to start before beat one of the bar. The Score Editor will then automatically display the notes before beat one as an upbeat.

In order to create an upbeat:

1. Create an empty MIDI region with the pencil tool in the Arrange window.
2. While holding the Option key, double-click the Region to open it in the Score Editor.
3. Move the MIDI region or its left boundary in the Arrange window to the position where the upbeat starts (e.g. an eighth-note before beat one). You may also drag the region boundaries in the Score Editor. Simply grab and drag the region boundary indicator below the Bar Ruler to the desired position.
4. Now you can enter the upbeat notes with the mouse in the Score Editor.

Changing the left Region boundary

Logic Pro 7: Set song folder permissions to read and write

This article has been archived and is no longer updated by Apple.
When loading a GarageBand song, Logic quits unexpectedly. This can happen because the song is inside a folder that has permissions set to read only.

To prevent this, set the folder to read-and-write permissions.

This issue will be resolved when you upgrade to Logic 7.1. If the folder containing the GarageBand song is read only, Logic will display a dialog box instead of quitting. You will still need to to set the folder to read and write before opening the song in Logic.

Logic Pro 7: "No Transpose" doesn‘t reset transposition of region

This article has been archived and is no longer updated by Apple.
The No Transpose option doesn't reset regions that are already transposed.

The transposition track affects the events of a region. Checking the option for No Transpose does not reset those events, but it does prevent them from being affected by further transpose manipulations.

Use these steps if you have transposed regions:

1. Deselect the No Transpose checkbox.
2. Bring the transposition track to 0.
3. Select the No Transpose checkbox.
4. Re-enter the required transposition.

Logic Pro 7: Phantom ports with audio interface M-Audio Delta 1010

This article has been archived and is no longer updated by Apple.

Symptom

The audio interface M-Audio Delta 1010 may show phantom duplicate ports in the utility Audio Midi Setup after updating the driver to version 1.1.7.

This doesn't happen if the driver is installed for the first time or if a full install is done instead of an update.

To avoid this issue, please remove the old driver components before installing the new one. Contact M-Audio for assistance with this procedure.

If you want to delete the components manually and at your own risk, use the following steps:

Warning: This procedure is only recommended for very experienced users.

1. Search for the strings "Delta" and "M-Audio" in the Finder.
2. Delete the found file(s).
3. Install the new driver.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Logic Pro 7: Keyboard shortcuts don‘t work in floating windows

This article has been archived and is no longer updated by Apple.
Logic lets you open any window as a floating window. These windows will stay on top of all other windows, regardless of the currently active window, and they don't accept any keyboard shortcuts. **Tip:** You can open a window as a floating window by holding down the Option key while choosing the window type from the Window menu.

Floating windows are normally used as informational windows which don't get covered by selecting another one. This can be useful for an Event List, an Environment, or a Mixer window, for example.

When a window is opened as as floating window, it does not accept any keyboard shortcuts which have been assigned to this window type. This gives you the advantage of floating windows in the foreground that won't block the key commands of an editor or Arrange window in the background.

For example: Open a normal Arrange window, and then open an Environment window as floating. In this configuration, all keyboard shortcuts are passed to the Arrange window. This way, you can use commands to move or delete Regions in the Arrange window without accidentally deleting a mixer channel or another object in the Environment window.

Exceptions to this rule are some special keyboard shortcuts for plug-in windows, which by default open as floating windows. Examples of these are next/previous plug-in setting or next/previous EXS instrument.

Logic Pro 7: Delays and reverb tails are cut off

This article has been archived and is no longer updated by Apple.
Delays sometimes get cut off when used in an insert slot of a a track that contains many short audio regions. That means the audio playback suddenly goes silent. Occasionally this also happens with reverb tails.

Since this issue only shows up with very short audio regions, try to use longer regions.

You can convert the short regions, into one long region. To do so, please select all regions of the track and choose:
Region > Merge > Regions.

iMac G5: Mold lines in back cover are normal

This article has been archived and is no longer updated by Apple.

It's normal for the iMac G5 to have surface lines on its back cover. These occur during manufacture of the enclosure and are called "mold lines." They appear on the back cover to the left of each port and the power button. Mold lines are not cracks and do not represent a weakness or defect in the plastic.

Note: Mold lines normally look very faint, so this picture has been darkened to make the line more visible.

Published Date: Feb 20, 2012

iMac G5: Fine Lines in Front Bezel are Normal

This article has been archived and is no longer updated by Apple.

It's normal for the Front Bezel of the iMac G5 to have fine lines at each corner. These occur during manufacture of the enclosure, and they're called "witness" lines.

Witness lines are not cracks and do not represent a weakness or defect in the plastic.

Note: Witness lines normally look more faint than in this picture, which has been darkened to make this one easier to see.

Logic Pro 7.0: Errors when importing an OMF file

This article has been archived and is no longer updated by Apple.

Symptom

When trying to import an OMF file from Pro Tools, AVID, or FinalCut Pro into Logic Pro, audio files are missing or one of the following alerts comes up:

- "Error Code 205. OMFI_ERR: Bento Container Error"
- "Error Code 118. OMFI_ERR: Invalid object attached to property"

Solution

This issue is resolved in Logic Pro 7.1, which no longer has a 107 audio region limitation when importing OMF files.

For Logic 7.0:

The errors are linked to the number of Audio Regions the OMF file contains. If one track of the OMF file contains more than 107 Audio Regions, one of these errors may occur. In case of split stereo files, each channel's regions count separately. This means that the error will in this case occur with more than 53 parts of a split stereo file (which equals 108 regions).

An OMF file that will be imported into Logic Pro cannot contain more than 107 Audio Regions per track. You may reduce the number of Audio Regions per track by joining some of them with digital mixdown or bounce function before exporting the OMF file.

Because of this limitation, you should use the AAF format for data exchange between Pro Tools, AVID, and Logic Pro. FinalCut Pro sessions can easily be transferred using Logic Pro's FinalCut Pro XML im- and export function.

Logic Pro 7: Wrong time signature position in Score

This article has been archived and is no longer updated by Apple.
When viewing a score in layout view mode, some sequences may show a time signature change at the beginning of the stave line instead of the actual position of the time signature change. Additionally, double bar lines at these positions are not drawn through all staves. When looking at the single sequence in the Score editor, the bar position is correct.

This may happen if:

- An automatic multi rest had been inserted manually into the sequence which shows the wrong time signature position.
- The multi rest is placed in the bar before the time signature change.

The multi rest can also be placed ten bars before the time signature change, as long as there's nothing between the multi rest and the time signature change.

After deleting the multi rest from this sequence, the score layout displays correctly.

If you need to preserve the multi rest in the sequence for printing it as a single voice, you may do the following:

1. Copy the sequence which contains the multi rest.
2. Delete the multi rest(s) from the original sequence (not from the copy).
3. Make sure the the original (now without the multi rests) is still included in your instrument set for the full score.
4. Keep the copy (with multi rests) for single voice printing only. Make sure it is not part of your instrument set for the full score.

If you don't know how to create and manage instrument sets, please refer to the Score section of the Logic Pro manual or the Logic Pro Help.

AppleWorks 6: Open Recent menu not showing the most recent items

This article has been archived and is no longer updated by Apple.

Sometimes you will notice that the Open Recent submenu in AppleWorks does not display the most recent document you have worked on. At other times, the most recent item may appear, though not necessarily at the top of the list.

This happens due to an issue with list sorting. Though the list is supposed to be sorted by date modified, it's actually sorted alphabetically. This means that you will always see just the top of your list (alphabetically) once the number of documents in the list exceeds the number specified for display in AppleWorks preferences.

There are three ways to address this:

1. Empty the list periodically (see below), and/or
2. Increase the number to display in Preferences, and/or
3. When you need the list, view it in a Finder or Explorer window, which will allow you to sort by date modified.

To empty the list:

1. Locate the Recent Items folder:

   Mac OS X
   ~/Documents/AppleWorks User Data/Starting Points/Recent Items/

   Note: The tilde "~" refers to your home directory.

   Windows
   C:\Documents and Settings\username\My Documents\AppleWorks User Data\Starting Points\Recent Items\

2. Drag the aliases from that folder to the Trash.

Logic Pro 7: EVB3 produces no sound when using channels 4 to 16

This article has been archived and is no longer updated by Apple.
You insert an EVB3 in the input slot of an Audio Instrument, but there is no sound output when playing the organ live with a MIDI keyboard or trying to play back a MIDI region on this track. What's going on?

Unlike all other Logic Pro Audio Instruments, the EVB3 accepts MIDI input only on MIDI channels 1-3. MIDI data with other channels (4-16) will be ignored. If the track's MIDI channel is set to a value beyond 3, the EVB will therefore remain silent.

Because organs usually have two manuals and a pedal, so does the EVB3. MIDI data on channel 1 or 2 plays the upper or lower EVB3 manual respectively, MIDI channel 3 plays the pedal. Set the MIDI channel of the EVB3 track to a value between 1 and 3 to play one of the manuals or the pedal.

The MIDI channel parameter

If you set the MIDI channel parameter to "All," the MIDI channel of your MIDI keyboard will be passed unfiltered to the EVB3. Choose this setting for a split keyboard or a dedicated organ keyboard setup. You may then set a dedicated MIDI mode in the EVB3 graphical interface.

For further information on this kind of MIDI setup, please refer to the EVB3 section of the Logic Pro Plug-In Reference manual.

Logic Pro 7: SMPTE time code is not written from within Logic Pro

This article has been archived and is no longer updated by Apple.
When setting the SMPTE mode to "Generate" (File > Song Settings > Synchronisation... > Unitor), the Unitor8 does not start writing SMPTE time code. The Write LED on the Unitor8 does not light up, and no SMPTE signal is created.

You can generate SMPTE time code from within Logic Pro with the MIDI interface Emagic Unitor8, but not if if a daisy chain of Unitor8 and AMT8 interfaces is connected to the computer and the first interface is an AMT8.

The Unitor8 should always be the first interface in the chain. AMT8 interfaces should be cascaded from the Unitor8. Otherwise, the extended synchronization features of the Unitor8 will not be available.

Using the application Unitor8 Control, you can stripe SMPTE from any device of the chain. **Note**: "Generate" can only be used for striping, not for realtime-synchronization.

Logic Pro 7: Incorrect beat grouping in the Score editor

This article has been archived and is no longer updated by Apple.

Symptom

The beat grouping setting in the time signature setting of the Score editor has no effect.

When the beat grouping default in a 7/8 measure is set to e.g. 3+4 or 3+2+2, the notes are beamed as 3+3+1. Other combinations of grouping settings and time signatures may also lead to incorrect results.

Solution

If the default beat grouping does not lead to the desired result, the notes can be beamed manually. Select the notes to be beamed and use the local menu function Attributes > Beaming> Beam selected (or the corresponding keyboard shortcut).

Logic Pro 7: First beats not in time after freezing

This article has been archived and is no longer updated by Apple.
The first beats of a track do not play back in time the first time playback is started after a track is frozen.

Having plug-in delay compensation enabled, a track containing the Linear Phase EQ will play back properly. As soon as this track is frozen, the first beats of this track's playback will no longer be in time. It sounds as if plug-in delay compensation has been disabled. This is only true for the first time playback has been started after freezing. From the second time on it is perfectly in time again.

A workaround is to start and stop playback immediately after freezing.

Published Date: Oct 7, 2016

Logic Pro 7: Wait for Note option doesn‘t work

This article has been archived and is no longer updated by Apple.
The count-in option Wait for Note in the recording settings does not work in Logic Pro 7.0, and it has been removed from Logic Pro 7.1. If this option is set in 7.0, the recording starts immediately.

You should use a suitable count-in instead of the Wait for Note option.

Published Date: Oct 7, 2016

Logic Pro 7: MIDI clock is always sent to all ports

This article has been archived and is no longer updated by Apple.
Even if you choose a specific port for MIDI clock transmission (File > Song Settings > Synchronization... > MIDI), the MIDI clock signal is still sent to MIDI port 0 (all ports).

MIDI Clock is always sent globally to the MIDI interface which then distributes it to all ports. This works similarly with all multi-port MIDI interfaces. This method has the advantage that the MIDI clock signal is sent only once to the interface and not multiple times for each output port, thus reducing the MIDI data stream.

Depending on your MIDI interface, you may filter MIDI clock by filtering "realtime messages" in the setup software for the MIDI interface itself. Emagic MIDI interfaces allow this with the included Unitor Control software.

Logic Pro 7: "Sample Clipboards with different Sizes not allowed for Stereo Files"

This article has been archived and is no longer updated by Apple.

Symptom

You get the alert message "Sample Clipboards with different Sizes not allowed for Stereo Files."

This happens when changing the tempo of an audio file with the Time & Pitch Machine, if the tempo of longer stereo audio files (interleaved or split stereo) is changed less than one bpm (e.g. from 120 to 120.9 bpm).

Solution

This happens only with time stretching algorithm Version 5. This version of the algorithm cannot process very subtle tempo changes on stereo files.

Use one of the Logic 6 Time & Pitch Machine algorithms for subtle tempo processing.

Published Date: Oct 7, 2016

Logic Pro 7: Volume fader does not control the recording level

This article has been archived and is no longer updated by Apple.
The volume fader does not change the recording level when an audio track is armed for recording. Logic always records with the same level, regardless of the volume fader setting.

The volume fader adjusts the level of the monitoring signal, not the input signal. The recording level remains the same, since it has no relationship with the level of the monitoring signal.

To decrease or increase the recording level, you have to adjust the gain of the signal source in your audio interface or mixing console.

Published Date: Oct 7, 2016

Logic Pro 7: Notes appear in the next measure

This article has been archived and is no longer updated by Apple.
In Score Editor, a note that you expect to appear at the end of a particular bar may appear instead at the beginning of the next bar, especially with very short notes.

To correct the score display, change the note position to a full bar (in the Matrix Editor or in the note parameters in the Score Editor). If you don't want to change the note position of the performance, set the quantize grid for the Score Editor to a finer value.

Why this happens
Logic uses a display quantization for the Score Editor. If a MIDI sequence has been recorded from live playing, the timing between the live instrument and the sequencer's tempo may not precisely synchronize. To create a readable score out of such a performance, Logic applies a dedicated display quantization to the MIDI data before displaying it as a score.

If a note lies between two quantization grid points, it will be displayed on the next available grid position. Therefore, depending on the note position and the quantize grid set in the Score window, some notes may appear in the next bar, when they are actually positioned in the previous one.

Logic Pro 7: Avoiding clicks in the audio signal of software synthesizers

This article has been archived and is no longer updated by Apple.
Learn how to avoid clicks in the audio signal of ADSR software synthesizers like the ES1, ES2, or Sculpture.

Clicks can appear in some cases when using the ES1, ES2, Sculpture, or other synthesizer while working with an ADSR section.

You can avoid these by paying attention to the following settings:

1. If the "Analog" slider is set to 0% (ES1/ES2), a special feature is invoked, oscillator and filter synchronization. The oscillator and the filter reset at every Note On. This enables the ES1 or ES2 to create synthetic percussion sounds with much attack and best reproducibility. To avoid clicks, set this slider at least to 1%.

2. The minimum setting of the attack and release time is 0ms, which means 0ms or 1 sample. So, if you want to avoid clicks from here, allow a little bit of attack. The sliders have a stretched characteristic at the lower end to allow a fine adjustment of the attack and release time.

3. If a synth voice is assigned to a new note with a different velocity, and a velocity range is there, you might hear a click, even with slow attack rates, because the ADSR works with the new velocity and immediately changes its output. Assign more voices to the software synthesizer to avoid this.

Logic Pro 7: No audio recording when using the "tape" icon

This article has been archived and is no longer updated by Apple.
When the tape recorder icon is used as symbol on an audio track in the arrange window, audio cannot be recorded.

To prevent this, do not use the tape icon on an audio track. Using a different symbol will resolve the issue.

Additional information
MIDI tracks that have the tape icon and are located in first position at the upper edge of the arrange window are reserved for arming tracks on external tape recorders (ADAT machines or similar) over MMC.

The record ready switch of these tracks will in this case toggle record ready for the external tape recorder which is connected to the corresponding MIDI out. On an audio track, arming the track leads to a dialogue asking for the audio record path. After defining it, when Logic is set into record mode, recording audio will be anticipated. The tape icon itself masks this external communication function. It cannot be used as audio track icon.

PowerBook: Testing Backup Battery

This article explains how to check the power of the internal backup battery in a PowerBook computer.
This article has been archived and is no longer updated by Apple.
The backup battery saves the PRAM and power management information on the logic board when the computer is shut down.

Checking the backup battery

1. Set the date and time.
2. Perform a Shut Down from the Apple menu or Special menu.
3. Remove the main battery and disconnect the power adapter for 10 minutes.
4. Connect the power adapter, insert the battery, and power on the computer.
5. If the date and time were lost the backup battery may be dead or discharged.
6. If the backup battery is rechargeable, remove any main batteries from the unit and leave the PowerBook plugged in for at least 4 hours. If discharged main batteries are installed in the computer, recharging the backup battery may take up to 48 hours to completely charge. It is okay to use it while it is charging.
7. If the backup battery appears dead or will not charge have the computer serviced.

Backup Battery Types

For additional PowerBook battery or backup battery part numbers , refer to document 11751: "**Macintosh Family: Batteries and Part Numbers**" for computers introduced before November 1997, and document 86181: "**Macintosh Family: Batteries and Part Numbers, Part 2**" for computers introduced after November 1997.

Simple Finder: Classic applications do not appear in "My Applications" folder

This article has been archived and is no longer updated by Apple.

If you add Classic applications to the list of approved items, they do not appear in the "My Applications" folder when using Simple Finder. This occurs when managing users via Workgroup Manager or via the Limitations feature found in the Accounts pane of System Preferences.

This issue happens with Mac OS X and Mac OS X Server versions 10.3.

As a workaround for clients managed via Workgroup Manager, consider adding that classic application to the list of Dock items.

Logic Pro 7: Opening songs from earlier versions

This article has been archived and is no longer updated by Apple.
When loading a song created in a version of Logic Pro prior to version 7, the song format will be converted to the version 7 format. The first time this song is saved, a Save dialog will appear giving you the option to rename the file so that the old song file will not be automatically overwritten.

Note: Once saved in version 7 format, a song can no longer be opened with versions prior to version 7 (exception: Logic Pro versions 6.4.3 and higher can open the song, but without any Logic Pro 7 specific features).

Logic Pro 7: Ultrabeat cannot import individual sounds

This article has been archived and is no longer updated by Apple.
Ultrabeat plug-in settings won't open when using the import function to load individual sounds of a different drum kit.

More specifically, when you load an Ultrabeat setting using the Import button in the upper portion of the Ultrabeat interface, you get an open dialog that points to the factory plug-in settings in the local domain:

/Library/Application Support/Logic/Plug-In Settings/Ultrabeat/

After you choose a setting, the drum kit fails to load, and the list for importing the drum sounds does not appear in the Ultrabeat user interface.

Resolve the issue by updating to Logic Pro 7.0.1 or later.

Drive Setup 1.7.3 and Earlier: Version History

This article details the version change history of Drive Setup version 1.7.3 and earlier.
This article has been archived and is no longer updated by Apple.

Drive Setup Changes for 1.7.3
This version provides improved reliability for Ultra ATA transfers on Power Macintosh G3 (Blue and White) computers.

Drive Setup Changes for 1.7.2
This version was posted to Apple Software Updates as a general release for Macintosh/Power Macintosh computers that can run system software 7.5 through Mac OS 8.5. Beginning with Drive Setup 1.7, the Low Level option for ATA drives was disabled, (Drive Setup does not low level format ATA hard drives). Although this option was disabled, users were able to still select this option. Drive Setup 1.7.2 now dims this option so it cannot be selected for ATA drives. This option can still be selected for Apple SCSI hard drives.

Drive Setup Changes for 1.7.1
This version shipped with some Power Macintosh G3 Blue & White computers to prevent an incorrect Mode Page issue that can occur with certain SCSI hard drives shipping in some Power Macintosh G3 Blue & White configurations.

Drive Setup Changes for 1.7
This version ships with the Power Macintosh G3 Blue & White computers, and the Strawberry, Lime, Tangerine, Grape and Blueberry iMac computers with Mac OS 8.5.1 and is only supported on these computers.

- Support for ultra DMA transfers in new ATA driver version 3.20
- Changes to update list of drives for ATAPI Zip and CD-ROM drives. When a user inserts media, the name of the volume is listed instead of Not Supported.
- Low level format option for all ATA drives has been disabled. This test was not performing a low level format. This test instead wrote zeros and performed subsequent reads to verify drive calculated checksums on the written data. With the exception of the read portion, this test was the same as the write zeroes option. The combination of both tests and the larger capacity of drives Apple is shipping provides unnecessary redundancy at the expense of the user experience. Drive Setup users can achieve the same functionality by selecting the Zero all data initialization option before initializing the hard drive followed by the Test Disk... function under the Function menu.

Drive Setup Changes for 1.6.2

- Changes made only to the Drive Setup application address a rare issue where the hard disk driver partition map can be improperly formatted. This would cause some 3rd party utilities to incorrectly report that block 0 is damaged or not allow the volume to mount. This version also ensures that two patches are always installed: the large volume support patch for Power Macintosh 6100, 7100 and 8100 computers which do not have large volume (2GB or larger) support in ROM, and the SCSI MESH patch for PCI Power Macintosh computers. This version does NOT install newer drivers than the drivers included with Drive Setup 1.6.1.

Drive Setup Changes for 1.6.1

- Fixed a potential data transfer issue on the PowerBook 5300 and PowerBook 2300 operating in SCSI Disk Mode.

Drive Setup Changes for 1.6

- Fixed a problem where ATA drives did not properly sleep.
- Also fixed a problem where Media bay devices were not properly reported on PowerBooks.

Drive Setup Changes for 1.5

- Support added for Power Macintosh G3 computers.
- Updates ATA driver to v3.10. This new driver fixes a write cache issue on some Apple ATA (IDE) hard drives was disabled following a restart. This issue is NOT specific to any Macintosh or Power Macintosh computer and can affect any computer that has an ATA (IDE) hard drive.

Drive Setup Changes for 1.4
Note: Drive Setup 1.4 is included with Mac OS 8.1 Update.

- Drive Setup 1.4 was tested with and supports Mac OS 8.1.
- Supports the same CPUs as Drive Setup 1.3.x, and adds support for Desktop/Minitower G3 and PowerBook G3 computers.
- Support for Mac OS Extended format.
- Fixed an issue where a SCSI Zip drive would show up as a CD-ROM if a cartridge wasn't in the drive

- Fixed an issue where a Micronet Premier MO 1300 drive would show up as 2 CD-ROM drives.

Drive Setup Changes for 1.3.1

- Version 1.3.1 is only required by Apple computers that have an internal ATA (IDE) hard disk.
- Installs the ATA (IDE) device driver version 3.07 if the computer includes an ATA (IDE) hard disk. The updated hard disk driver prevents a rare incident in which you may lose files on your hard disk or be unable to start up the computer using your hard disk. (If your computer is unable to start up, you see a flashing question mark on your screen.)

Drive Setup Changes for 1.3

- Drive Setup now supports all Macintosh and Power Macintosh models supported by Mac OS 8.
- Takes full advantage of the enhanced throughput of Ultra SCSI-2 Fast/Wide drives.
- Incorporates Mac OS 8 "look and feel".

Drive Setup Changes for 1.2.5

- Limited release for Power Macintosh Workgroup Servers 7350 and 9650, with added functionality specific to these models.
- NOT RECOMMENDED for use on other computers. Superceded by later versions of Drive Setup.

Drive Setup Changes for 1.2.4

- Includes the ability to repair a drive that is damaged as a result of updating with Drive Setup 1.2.2 after initializing with Apple HD SC Setup 7.1.2 or earlier.
- IMPORTANT Apple HD SC Setup should only be used with older 68k-based Mac OS computers.
- Added the ability to access drives with SCSI IDs greater than 7 (SCSI-2 Fast/Wide).

Drive Setup Changes for 1.2.3
ATA Driver (v3.0.4) changes in Drive Setup 1.2.3
The IDE driver was changed to correct a stack overflow problem, which occurred during large reads. Reads over one megabyte are now broken up into smaller chunks and the ATA Manger is called synchronously for each of the smaller calls.

- Correction for volumes being mounted (by VM) at boot time even when the "do not mount" option is selected.
- Correction for non-recoverable errors caused by the drive exceeding the ataManager's timeout.
- Correction for large reads on the PowerBook 1400 causing bus errors.

SCSI Driver (v8.0.6) changes in Drive Setup 1.2.3

- Corrected the undesired mount by VM on SCSI drives.
- Fixed a problem with large-sized reads and writes to disk on the internal drives of Performa 6400-family computers which could cause hangs.
- Added the ability to safely update over Apple HDSC Setup drivers.

Drive Setup Changes for 1.2.2

- Improvements in recognition of secured volumes.
- Minor changes to ensure compatibility with the Mac OS 7.6 Installer.

Drive Setup Changes for 1.2.1

- Limited release for a few Power Macintosh computers unique to some European markets. NOT RECOMMENDED for use on other computers.
- Superceded by later versions.

Drive Setup Changes for 1.2

- Includes SCSI MESH patch for PCI Power Macintosh models.
- Added support for selected 68k-based Mac OS computers with internal ATA hard drives.

Drive Setup Changes for 1.1

- Provides DMA support for ATA based computers.
- Fixed a problem where an ATA device's capacity was not correctly recognized.

Drive Setup Changes for 1.0.5

- No changes to the SCSI driver.
- No changes to the IDE driver.
- Updated Drive Setup application to assure that volume creation dates are different when creating multiple partitions on a hard drive. This change fixes a problem where, in rare cases, custom icons may appear incorrectly on a volume with multiple partitions with the same creation dates.
- Drive Setup 1.0.5 waits 3 seconds between calls to the Disk Init Package ensuring that volume creation dates are different. This prevents a problem with custom icons not appearing correctly on drives with multiple partitions.
- Drive Setup 1.0.5 requires System Software 7.5 or later and is only supported for use with the following systems:
- -- Power Macintosh systems (including PowerPC-based Performa systems)
- -- PowerPC-based PowerBook computers*
- -- Macintosh 580- and 630-series systems and PowerBook 190 series
- Drive Setup does not currently support the Macintosh Processor Upgrade. If the upgrade is installed in a Macintosh 580- or 630-series system, use the "601 Processor Upgrade" control panel to turn the card off before using Drive Setup.

*The following computers are in the PowerPC-based PowerBook computer family: PowerBook 5300, 5300c, 5300ce, 5300cs, 2300c, 1400c, and 1400cs. Additionally PowerBook 200 and 500 series computers which have PowerPC upgrade cards installed are included in the PowerPC-based PowerBook computer family.

Drive Setup Changes for 1.0.3

- No changes to SCSI driver. This is the same SCSI driver that is included with Drive Setup 1.0.2.
- Installs updated IDE driver (ATA v1.12) for systems that were previously supported by previous versions of Drive Setup.
- Some Apple IDE hard drives require extra time to flush its caches at shut down and restart. This new IDE driver ensures that the drive's caches are properly flushed.
- Corrects an issue with the PowerBook 190, 2300 and 5300 series of computers where, in some cases, the system will freeze after wake up.
- Drive Setup 1.0.3 requires System Software 7.5 (or later) and is only supported for use with the following systems:
- -- Power Macintosh systems (including PowerPC-based Performa systems)
- -- Macintosh 580- and 630-series systems
- -- PowerBook 190, 2300, and 5300
- Drive Setup 1.0.3 does not support the Macintosh Processor Upgrade. If the upgrade is installed in a Macintosh 580- or 630-series system, use the "601 Processor Upgrade" control panel to turn the card off before using Drive Setup 1.0.3.

iMovie: Having both an II-DC camera and a DV camera connected may result in "Camera Not Connected" message

This article has been archived and is no longer updated by Apple.

If you are have difficulty getting your iSight (or other II-DC FireWire webcam) to be recognized in iMovie and get a "Camera Not Connected" message, try these simple steps:

- Make sure that no other application is open that might be using the webcam, such as iChat AV.
- If you have a DV camera (video camera/camcorder) connected to the computer, disconnect the DV device and reopen iMovie.

For additional assistance see My iSight won't communicate with iMovie.

Exporting to Apple Lossless from Logic 7

This article has been archived and is no longer updated by Apple.
Logic Pro 7 and Logic Express 7 cannot export files directly to Apple Lossless. Instead, you'll need to first export your project to AIFF, and then convert the AIFF file to Apple Lossless using iTunes.

1. Export your project as an AIFF file from Logic Pro 7 or Logic Express 7.
2. Open the AIFF file in iTunes (version 4.6 or later).
3. From the **iTunes** menu, choose **Preferences**.
4. Click the Importing tab.
5. From the **Import Using** pop-up menu, choose **Apple Lossless Encoder**.
6. Click OK.
7. Select the AIFF file in iTunes and from the **Advanced** menu, choose **Convert selection to Apple Lossless**.

To locate your new Apple Lossless file in the Finder, select it in iTunes and from the **File** menu, choose **Show Song File**.

Mac OS X Server 10.3: Disk quota not enforced for NetInfo users

This article has been archived and is no longer updated by Apple.
When set in Workgroup Manager, disk quotas are not enforced for users whose accounts are in the local NetInfo database of the server, even though the "homedirectoryquota" attribute appears in the user records.

The simplest workaround is to configure the server to be an Open Directory Master and to export the local NetInfo accounts into the LDAP database. To accomplish this, do the following:

1. Open Server Admin, and go to the Open Directory service.
2. Click the Settings button, and then the General tab.
3. If the "Role:" pop-up menu is set to "Standalone Server," select "Open Directory Master" from the list, and you'll be prompted to enter a server administrator's name and password, the Kerberos realm name, and the LDAP search base.
4. Open Workgroup Manager, and go to the NetInfo database.
5. Select the users you wish to import into the LDAP database.
6. From the **Server** menu, choose **Export**.
7. Navigate to the LDAP database in Workgroup Manager.
8. From the **Server** menu, choose **Import**.
9. Locate the export file created in step 6, then click the Import button.
10. You'll have to reset the imported user passwords at this point.

If you have to use a Standalone server, or need to store user accounts in the NetInfo domain on an Open Directory Master, you can use /usr/sbin/edquota instead of Workgroup Manager to set and enforce disk quotas. For more information on edquota, you can launch /Applications/Utilities/Terminal and type `man edquota` at the prompt.

Logic Pro 7: Tuner defaults to 410Hz

This article has been archived and is no longer updated by Apple.
When you insert an ET1 tuner, it is set to a standard pitch of 410Hz instead of 440Hz.

To open the tuner with a default pitch of 440Hz, set it to 440Hz and save the setting under the name "#default" in the plug-in settings folder for the ET1.

If a setting with this name exists in the user or local domain, all effects and software instruments included with Logic Pro will load it as the default.

This issue is resolved in Logic Pro 7.0.1 and later.

Published Date: Feb 19, 2012

Apple Loop Utility does not launch from Logic or Soundtrack

If you can't launch Apple Loop Utility from within Logic or Soundtrack, resolve the issue by deleting this file:

/Library/Caches/com.apple.LaunchServices.6B.csstore

Published Date: Oct 7, 2016

Logic Pro 7: Modulation phase shift when exporting Region as an audio file

This article has been archived and is no longer updated by Apple.
After exporting a Region as an audio file, the phase of a modulation plug-in may be different than when playing the song from the start.

The Low Frequency Oscillator (LFO) of a modulation plug-in is triggered once when the sequencer playback is started. Thus, the phase of an LFO at a certain song position depends on the position where the playback has been started.

When exporting a Region as an audio file, the playback starts at the Region start and triggers the LFO at this position.

To preserve the phase the same as when playing back the song from the start, follow these steps:

1. Export the whole track as an audio file.
2. Import the exported audio file into the Arrange window.
3. Divide the new Audio File into Regions with the function Strip Silence from the local Audio menu in the Arrange window.
4. Delete the Regions you don't need.
5. Double-click the Region to open it in the Sample Editor.
6. From the local **Functions** menu, choose **Trim**.

Using iPod photo with Belkin Media Reader and Belkin Camera Link

This article has been archived and is no longer updated by Apple.
iPod photo Software 1.1 continues to support the Belkin Media Reader and the Belkin Camera Link, with the following differences:

With the Belkin Media Reader with iPod Software 1.1 for iPod photo, you can browse photos you just imported without having to sync iPod with your computer.

The Belkin Camera Link functions the same, whether you are using the 1.0 or 1.1 software. This means if you want to view the photos you imported to iPod photo, load them on your computer from iPod and then use iTunes 4.7 or later to sync them back to iPod photo.

Power Mac G5: Internal speaker doesn‘t mute if digital speakers are attached

This article has been archived and is no longer updated by Apple.
When you have digital speakers connected to your Power Mac G5, your internal speaker will not mute--even if you select the mute checkbox in Sound preferences. But you can set the internal speaker's volume low (in Sound preferences) as a workaround.

"Digital speakers" means speakers that connect to the optical Digital Out audio port with Toslink cables, and use the S/PDIF (Sony/Philips Digital Interface) protocol.

To mute the internal speaker, disconnect the digital speakers. Or, if you like, use a different kind of speakers to avoid this issue.

iTunes 4.7 cannot sync photos to iPod photo from a locked volume

This article has been archived and is no longer updated by Apple.
When iTunes 4.7 first syncs photos to an iPod photo, it creates a cache folder in the folder where the photos are stored.

If you don't have write access for the selected drive or volume, you will get a "permissions error" when you try to sync photos. This will happen because iTunes cannot create the cache folder on the read-only volume.

The solution is to copy the photos to your hard drive first, then tell iTunes where the photos are stored. Be sure not to select a volume that is always read only, such as a CD-ROM or DVD-ROM disc.

Logic Pro 7: "XSKey driver too old!" message during launch

This article has been archived and is no longer updated by Apple.

Symptom

When you try to open Logic Pro 7, you get a message that the XSKey driver is too old and has to be updated.

This happens only on systems which have had Logic 5 installed but not Logic 6. In this case, the XSKey driver cannot be updated by the Logic 7 installer.

Solution

Update the XSKey driver to resolve the issue. Follow these steps:

1. Download the installer.
2. Run the XSKey.pkg Installer.
3. Restart your computer when the installation is complete.

iPod photo: Should I use NTSC or PAL for TV Out?

This article has been archived and is no longer updated by Apple.
The iPod photo can deliver video out in either NTSC (National Television Standards Committee) or PAL (Phase Alternation Line) video formats.

NTSC is the standard broadcast signal received by televisions in the United States. PAL is the standard broadcast signal received by televisions in many European countries.

The main difference between NTSC and PAL is that NTSC delivers 525 lines of resolution at 60 half-frames per second, whereas PAL delivers 625 lines at 50 half-frames per second.

iPod photo will attempt to guess the appropriate video format to use based on the geographical region that it was sold in. If the incorrect video format is used, the image displayed on the television will be poor or garbled. Additionally, if the incorrect video format is selected, it can be changed in the following menu location:
Photos > Slideshow Settings > TV Signal

Published Date: Oct 7, 2016

iPod: Viewing a slideshow

This article has been archived and is no longer updated by Apple.

Some iPod models allow you to play a slideshow with music and transitions, either on its own display or on a television. Models that can display to a television currently include:

- Fifth Generation iPod (iPod with video)
- iPod with color display (also known as iPod photo)

If you're not sure what iPod model you have, see "Identifying different iPod models."

To access slideshow settings, select Photos > Slideshow Settings. Although iPod nano has a color display, it won't output a slideshow to a TV.

Choosing the display

- To display slideshows on the iPod display, set TV Out to Ask or Off.
- To display slideshows on a television, set TV Out to Ask or On.

If you set TV Out to Ask, iPod will give you a choice of display every time you start a slideshow. The first time you use a TV, you'll probably need the Tips for TV viewing and Connecting to a TV sections below.

Slideshow settings

- To set how long each slide is displayed, select Next Slide and choose a time.
- To set the music that plays during slideshows, select Music and choose a playlist.
  Tip: If you're using iPhoto, you can choose From iPhoto to copy the iPhoto music setting.
- To set slides to repeat, set Repeat to On.
- To set slides to display in random order, set Shuffle Photos to On.
- To set slides to display with wipe transitions, set Transitions to On.

Playing a slideshow

- Select any photo or album and press Play, or select any full-screen photo and press the select button.
- Play/Pause will pause the music and slideshow.
- To skip to the next or last photo, press the Next/Fast-forward or Previous/Rewind button.

Connecting to a TV

iPod models that support displaying video on an external video source can do so in two different ways.

Method 1 (Composite video)
Using the AV cable connected directly to the top of the iPod or to the line out port on the Universal Dock.

Method 2 (S-video)
Using S-video when the iPod is in the Universal Dock.

Method 1 setup (Composite video)
This method can be used when the iPod is either in or out of the dock. Additionally, you would need a television or other video device that has RCA inputs.

1. Connect the AV cable into the iPod (where the earbuds would normally connect) or to the line out port on the Universal Dock.
2. Connect the red RCA connection into the right audio input of the television.
3. Connect the white RCA connection into the left audio input of the television.
4. Connect the yellow RCA connection into the video input of the television.

Tip: The RCA input connectors on a television are usually color coded to match the colors on the AV cable.

Method 2 setup (S-video)
This method provides slightly better image quality and should be used if possible. This method requires a television or other video device with S video inputs. Additionally, S-video can only be used when the iPod is in the Universal Dock.

1. Place iPod in the Universal Dock.
2. Connect a S-video cable to the S-video out port on the Universal Dock. This connection provides the video signal.
3. Connect the other end of the S-video cable to the S-video input on the television.
4. Connect the AV cable to the line out port on the Universal Dock. This connection provides the audio signal.

5. Connect the red RCA connection into the right audio input of the television.
6. Connect the white RCA connection into the left audio input of the television.

Some televisions may need to be set to channel 3 or 4 or "video" to receive input. Check with the documentation for your television if you're not sure.

Important: You should only use the included cable. Other RCA video cables won't work. Though other cables may look similar, only the Apple iPod AV Cable works with the iPod Headphones and AV port.

Tips for TV viewing

NTSC or PAL?
Compatible iPod models can deliver video out in either NTSC (National Television Standards Committee) or PAL (Phase Alternation Line) video formats. You will have to set the TV Signal setting to either NTSC or PAL when viewing on a television. These are two different broadcast standards, and your TV will only work with one of them. If you don't know which your TV is, simply try both settings to find the one that matches.

NTSC is the standard broadcast signal received by televisions in the United States. PAL is the standard broadcast signal received by televisions in many European countries.

The main difference between NTSC and PAL is that NTSC delivers 525 lines of resolution at 60 half-frames per second, whereas PAL delivers 625 lines at 50 half-frames per second.

iPod will attempt to guess the appropriate video format to use based on the geographical region that it was sold in. If the incorrect video format is used, the image displayed on the television will be poor or garbled. Additionally, if the incorrect video format is selected, it can be changed in the following menu location:
Photos > Slideshow Settings > TV Signal

Video input on TV

You may then need to select the correct video input on your television. If you're not already familiar with the input features of your TV, you'll need to read the manual that came with your TV. If the TV is not set correctly, the slideshow will not appear.

Don't forget the sound

The video cable does not carry sound, so you'll need to use the regular audio connections regardless of which display you choose. Run an audio cable from the Line Out port on your Universal Dock to an input on your TV or receiver, for example.

DVD Studio Pro: Too many Chapters and Stories may cause playback issues in some players

This article has been archived and is no longer updated by Apple.

DVD Studio Pro allows more than 999 cumulative PTTs per VTS. To determine if your title exceeds this limit, use this equation:

PTTs = *S* x *C* + *M*

Where:

- S = Number of Stories
- C = Chapters per story
- M = Number of markers in the associated track

If this number exceeds 999, some DVD players may report an error or have issues playing back the disc.

iBook, iBook (FireWire): How to find the Serial Number

This article has been archived and is no longer updated by Apple.

This document explains how to find the serial number on the original models of iBook. For other iBooks, see document 86321, "Locating your iBook Serial Number".

To find the serial number using software

On most computers with Mac OS X you can find the serial number in the About This Mac window. See technical document 106486, "About This Mac Window Provides Computer Serial Number".

To find the serial number located on the computer

These models of iBook are covered in this document:

- iBook
- iBook (FireWire)

The serial number for these iBook models is located in the battery bay.

1. If the computer is on, shut down it down and close the lid.
2. Turn the computer over so you are looking at the battery door.
3. Remove the battery door. For information on how to do this, see technical document 58447, "iBook: Replacing the Battery".
4. The serial number is located near the bottom edge of the battery door. See below.

Windows Domain Member Servers Cannot Host Profiles

This article has been archived and is no longer updated by Apple.

If you configure a Mac OS X Server to act as a Windows Domain Member of another Mac OS X Server running as a Windows Primary Domain Controller, Profiles cannot be stored on the Domain Member.

Symptom

You can configure a User account in Workgroup Manager to store a Profile on a Mac OS X Server acting as a Windows Domain Member. When a user in this configuration authenticates from a Windows workstation to a Mac OS X Server running as a Windows Primary Domain Controller, the Windows computer will attempt to access the Profile share point that resides on the Windows Domain Member. In a default configuration, accessing this share point will fail.

Solution

There are a few reasons that Windows clients will fail to access the Profile share point that resides on the Windows Domain Member Server.

The first reason is that the share point is not automatically created on the Windows Domain Member Server. In order to allow windows clients to access the Profile share point, one must first create the Profile directory and then create a share point of the directory.

This article assumes that in Workgroup Manager you have set your User's Profile location as: \\\\<domain member server netbios name><share point><optional path to subfolder><User Name>

To create the Profile directory on the Windows Domain Member Server, execute this command:

```
sudo mkdir -p -m 770 <Path to Profile share point><optional path to subfolder>
```

If asked to authenticate, enter your admin account password.

Next, change the ownership on the new directory:

```
sudo chown -R root:staff <Path to Profile share point>
```

If asked to authenticate, enter your admin account password.

Next, on the Windows Domain Member Server, as root, add the following lines to the end of /etc/smb.conf

```
[profiles]
 path = <Path to Profile share point>
 oplocks = yes
 strict locking = no
 read only = no
 browseable = no
```

Last, on the Windows Domain Member Server, restart Windows Services in Server Admin.

The second reason that Windows clients will fail to access the Profile share point that resides on the Windows Domain Member Server is that specific version of Windows requires a security descriptor be sent to the server hosting the profile. The versions of Windows that require the security descriptor are Windows 2000 running Service Pack 4 and Windows XP running Service Pack 1. Perform the following steps on the Windows machines to disable the requirement for a security descriptor to be sent to the server hosting the profile.

1. Select Start > Run.
2. Enter gpedit.msc and click Run.
3. If running Windows 2000 running Service Pack 4:

   Go to Local Computer Policy > Computer Configuration > Administrative Templates > System > Logon

   If running Windows XP running Service Pack 1:

Go to Local Computer Policy > Computer Configuration > Administrative Templates > System > User Profiles

4. Enable "Do not check for user ownership of Roaming Profile Folders".
5. Restart the system.

iMac (Slot Loading): How to locate the Serial Number

This article has been archived and is no longer updated by Apple.

This document explains how to locate the serial number on slot-loading iMac computers. For other iMacs, see document 86320, "Locating your iMac Serial Number".

To find the serial number using software

On most computers with Mac OS X you can find the serial number in the About This Mac window. See technical document 106486, "About This Mac Window Provides Computer Serial Number".

To find the serial number located on the computer

These models of iMac are covered in this document:

- iMac (Slot Loading)
- iMac (Summer 2000)
- iMac (Early 2001)
- iMac (Summer 2001)

The serial number is on a sticker on the underside of your iMac.

Note: The parenthetical product descriptions (Summer 2000) and (Summer 2001) refer to the summer of the Northern Hemisphere.

LaserWriter 12/640 PS: Network LaserWriter Sharing

I have an Apple LaserWriter printer that supports TCP/IP, a Power Macintosh computer, and two PC computers running Windows 95. I would like to connect all of these items on 10BaseT Ethernet so that all the computers can print over Ethernet. I found that I cannot see the printer with the Windows 95 computers, but I am able to print from the Macintosh computer just fine.
This article has been archived and is no longer updated by Apple.
Although Windows 95 offers built-in peer-to-peer networking via TCP/IP, IPX, and NetBEUI protocols, there are no built-in services for network printing without a print server or additional printing software.

Macintosh computers have built-in peer-to-peer networking as well as printing services via the AppleTalk and TCP/IP (LPR) protocols.

Workaround
Connect one of the PC computers directly to the LaserWriter using a parallel connection, then use Windows 95 print sharing to make the printer available over the network. The computer would be acting as a print server, handling all PC traffic going to the printer. Because the LaserWriter 12/640, LaserWriter 16/600 PS, LaserWriter 16/660 PS, LaserWriter 8500, Color LaserWriter 12/600 PS, and Color LaserWriter 12/660 PS can have a concurrent Ethernet and parallel connection, a Macintosh computer can continue to print directly to these printers over Ethernet (without having to go through the PC computer).

Other alternatives such as CopsTalk from Cops, Inc. and PC MACLAN for Windows 95 from Miramar Systems, Inc., provide AppleTalk protocol services for Windows 95 clients. Installation of either of these third party alternatives provides access to AppleTalk network printer services without the need of a print server or printer sharing via direct serial connection.

Lastly, LPR client software for Windows can be used to print over TCP/IP to LaserWriter printers that support TCP/IP. Some LPR clients are commercially available; however, Apple does not have any specific product recommendations. Some LPR clients are available as shareware and freeware, as well.

Mention of third-party products is for informational purposes only and constitutes neither an endorsement nor a recommendation. Apple assumes no responsibility with regard to the performance or use of these products.

Ejecting large capacity iPods in Windows may take a long time

This article has been archived and is no longer updated by Apple.

When using a large capacity iPod with a Windows-compatible computer, it can take a while to eject the iPod when it contains many photos and it does not have the "disk use" option enabled. To speed up the time to eject the iPod, select the "Enable disk use" option.

Set "Enable disk use" in Windows

In iTunes 7.0 or later

1. Connect your iPod to your computer.
2. When the iPod icon appears in the iTunes window (below Devices), select it.
3. If the Summary pane isn't showing, click the Summary tab.
4. If not checked, select "Enable disk use." This will automatically be checked and dimmed if "Manually manage music and videos" is checked.
5. Click the Apply button in the bottom right-hand corner of the iTunes window.

In iTunes 6.05 or earlier

1. Connect iPod photo to the computer.
2. Open iTunes.
3. From the **Edit** menu, choose **Preferences**.
4. Select the iPod tab.
5. Select the General tab.
6. Select the "Enable disk use" checkbox.
7. Click the OK button to close the iTunes Preferences.

For information on safely disconnecting iPod from your computer, see Disconnecting iPod from your computer.

Safari quits unexpectedly after migration to a new computer

This article has been archived and is no longer updated by Apple.
Safari may quit unexpectedly, or "crash," when visiting certain websites after you've used the migration feature of Setup Assistant to move from one Mac OS X 10.3 computer to another.

Use of the migration feature inadvertently backdates one component of Java software on computers that have the most recent Java version (1.4.2 Update 2), thus causing the issue. In that situation, Java won't work for various applications, including Safari.

To resolve this issue, simply reinstall Java 1.4.2 Update 2. Software Update will automatically spot the out-of-date component and offer you the update for reinstallation.

Logic Pro 7: How to fix the position of a marker

This article has been archived and is no longer updated by Apple.
Learn how to fix the position of a marker on the timeline.

Markers are by default linked to their bar position, not to a time based position. This means that a marker will move in time when changing the tempo of the song. As an exception, markers that have been created by analyzing the scene cuts of a movie are automatically linked to their SMPTE time position.

Markers can also manually be linked to the SMPTE time position rather than the bar position. Use the "Lock SMPTE Position" command for this:

1. Select the markers you want to link to the SMPTE time.
   Tip: clicking on the marker track selects all markers.
2. Choose **Region** > **Lock SMPTE Position** from the local **Arrange** menu, or use the corresponding key command.

The markers will now be SMPTE locked and thus won't follow tempo changes. A padlock symbol in the marker display indicates the SMPTE lock.

Tip: This works for all objects in the Arrange window. If you want to lock the position of an Audio or MIDI Region, select the Regions and choose Lock SMPTE Position.

Mac OS X 10.3: Setup Assistant migration may transfer portable-only menu items to a desktop computer

This article has been archived and is no longer updated by Apple.

Using Setup Assistant to transfer data from a portable Mac to a desktop Mac? Some portable-only Finder menu items may appear on the desktop computer after the transfer, but you can easily get rid of them.

For example, you may see a battery icon in the menu bar after using the migration option of the Setup Assistant. Desktop Macs don't have the ability to run on batteries like portable Macs do, so this menu does nothing on your desktop computer.

Want to make such a menu item disappear? Easy--just hold down the Command key as you drag the unwanted icon off the menu bar. Poof! The icon disappears into a cloud of virtual dust.

If this trick doesn't work with a third-party menu item, get in touch with the company that makes the software associated with the menu item.

Logic Pro 7: No format change for Freeze files

This article has been archived and is no longer updated by Apple.
The Logic Pro 7 Reference Manual misleadingly states that the Freeze file format can be changed to 16 or 24-bit in Preferences > Audio. This information is no longer true for Logic 7.

If you used the Freeze function for exporting audio tracks in Logic 6, you can now use the superior feature of "Export Track as Audio File."

Choose **File** > **Export** > **Track As Audio File** or **Export All Tracks As Audio Files**.

This opens a file selector which allows to set the bit depth and audio file format. The first option exports only the selected track, and the second option exports all tracks which actually produce a sound (i.e. which are not muted or only the soloed ones).

This approach has a few advantages:

- With the export track function, the tracks are named more conveniently than when using the Freeze function in Logic 6, and you can freely choose the file destination and format for each export.
- The Freeze function can only ensure perfect sound quality in all cases when using 32-bit audio. Reading 32-bit files from the hard drive takes only a few percent more hard disk performance than reading 24 or 16-bit files (because most of the time is needed for seeking, not for reading).

Apple Portables and AirPort Express: How to care for your AC Plug

This article has been archived and is no longer updated by Apple.

The power adapter that comes with iBooks and PowerBooks has an optional AC plug or "duck head." This AC plug is also used in the AirPort Express.

Follow these tips for best performance:

- Before using your AirPort Express or power adapter with the AC plug, make sure that the plug is free from foreign objects and debris that could have accumulated since the last time it was used.
- Periodically check the AC plug to make sure it is in good working order, as described in this article.
- When you store the power adapter or AirPort Express, make sure the electrical prongs (AC blades) are folded for storage, and store the adapter or AirPort Express in a padded bag or container.
- When you use the AC plug, firmly seat the plug with blades folded onto the power adapter or AirPort Express, then snap the AC blades into their completely extended position before you plug the adapter into the power outlet.

If you notice any of the following, discontinue use of the AC plug:

- The AC blades are bent. (DO NOT straighten a bent blade.)
- The AC blades fail to lock into place.
- The blades wobble (side to side) when they are locked in the open position.
- The AC blades have black marks or other visible damage.
- The adapter or AirPort Express does not power on or powers on intermittently when securely plugged in to a known good wall outlet.
- You have heard popping sounds come from within the AC plug.

For more information on troubleshooting portable power adapters, click here.

AirPort: How to update the firmware on your AirPort Extreme or AirPort Express from a Macintosh

This article has been archived and is no longer updated by Apple.
The first step in updating firmware is to connect to the base station. There are several ways you can do this. Here are two examples:

- Choose a base station's unique network name from the AirPort menu, or
- Connect your computer to the base station using an Ethernet cable.

Tip: If your network uses multiple base stations, roaming, wireless distribution system (WDS), or a third-party router, you might have to use different types of connections. See the "Advanced information" section below to learn more about updating over other types of connections.

How to update

After you have connected to the base station, follow these steps to update the firmware:

1. Download the firmware update for your AirPort Extreme or AirPort Express.
2. Open the Firmware Updater. It should display all available base stations.

3. Select the base station, and click the Update button. This will start the firmware update process. This process may take a few minutes while the update is transferred to your AirPort Extreme or AirPort Express.

4. Click the OK button when the application notifies you that the update is finished. You will see your base station listed with the updated firmware version. If you have more base stations to update, return to step 3. If you are done updating you can Quit the application.

Advanced information

You may connect to a base station directly or indirectly. In a **direct** connection, communication passes from your computer to the base station that's being updated without going through any other device. If you only have one base station, your connection is always direct. The examples above are direct connections.

In an **indirect** connection, communication passes through a third device (usually another base station or router) to reach the base station that is being updated. This can happen on networks configured for roaming and/or WDS, or that have third-party routers or access points. Direct connections are preferred but not required.

Base station firmware 5.3 or later improves the ability to update the base station over an indirect connection (firmware 5.3 is included with AirPort software version 3.3 and is also available for separate download). If your base station has not been updated to firmware 5.3 or later, or if you are in the process of updating to version 5.3, a direct connection is the most reliable.

Updates over an indirect connection will not work under some circumstances when using firmware prior to 5.3, so they are not the preferred method. They do often work, however. Attempting to update over an indirect connection is worthwhile if it will save you the effort of making a direct connection to an inaccessible base station (such as one mounted in a ceiling). If the indirect update is not successful, connect directly.

Tip: The way you can tell that an indirect attempt has been unsuccessful is that AirPort Admin Utility will display the progress indicator (looks like a spinning pinwheel) for over three minutes, remaining unresponsive to other input. When this happens, choose Force Quit from the Apple Menu, select AirPort Admin Utility from the dialog, and click the Force Quit button.

Note: Mac OS X 10.2, Microsoft Windows 2000, and Windows XP users must download the 5.3 firmware separately. The AirPort 3.3 software is for Mac OS X 10.3 or later only. Links to the Windows AirPort Admin Utility and the latest firmware are on the AirPort support page
.

Examples of indirect connection:

- You connect wirelessly to the station with network name "A", which has a wired or wireless (WDS) connection to the target base station with network name "B".
- You choose a base station's non-unique network name in the AirPort menu.
  Note: When base stations have the same network name, known as "roaming," then you may be passing through another base station to reach the target base station.

Ensuring a direct connection

If you can't use the direct methods described above, try one of these two methods:

- Temporarily rename the base stations' networks.
- Temporarily unplug all but the target base station.

This third method almost always works:

1. Locate your computer near the target base station (or vice versa).
2. On the computer, turn AirPort off in the AirPort menu.
3. Turn AirPort on again.

Your computer should associate with the nearest base station when AirPort is turned back on, though unusual circumstances or sources of interference can keep this method from being 100 percent reliable.

Some software DVDs may fail to mount in SuperDrives

This article has been archived and is no longer updated by Apple.

Some SuperDrive-equipped Power Mac G5, Power Mac G5 (June 2004), and eMac (USB 2.0) computers may not consistently mount all of the DVD discs included in some Apple software packages. Sometimes the DVD-ROM media will mount; other times it will be rejected (the optical drive will eject the disc with no error message).

The issue does not consistently affect all of the included media, and may occasionally be seen with non-Apple software products.

Some of the discs that may cause this issue include the following Apple retail software (released since May 2004):

- Final Cut Pro HD
- Production Suite
- Logic 7
- Logic Express
- Remix Tools (Jam Pack 2)
- Rhythm Section (Jam Pack 3)
- Motion
- iLife '05
- Mac OS X 10.4 Tiger
- Mac OS X Server 10.4

If you are experiencing this issue, download and install the SuperDrive Firmware Update.

How to reinstall AppleWorks on an iMac G5, Mac mini, or iBook G4

This article has been archived and is no longer updated by Apple.

If you reinstall a localized version of Mac OS X on an iMac G5, Mac mini, or iBook G4, you may need to reinstall AppleWorks separately.

To custom install AppleWorks, follow these instructions:

1. Insert your Mac OS X Install Disc 1 into the optical drive.
2. Double-click the package named Install Bundled Software Only.
3. When you see "Welcome to the Mac OS X Installer," click the Continue button.
4. Select your destination disk, click Continue.
5. In the next screen, choose the button that says Customize.
6. Deselect all checked items in the list of components.
7. Click the disclosure triangle next to the line that says "AppleWorks Languages."
8. Select the version of AppleWorks that corresponds to the language you would like to use.
9. Click the Upgrade button.

For more information on installing the additional applications that came with your computer, see the document called "Read Before You Install," located on the Mac OS X Install Disc 1.

iMovie: Some special characters (Unicode) do not display in titles

This article has been archived and is no longer updated by Apple.

Symptom

Using some Unicode-only characters in iMovie titles may result in the character being displayed as a blank, question mark, or rectangle when the title is rendered. The character may also cause the rest of the title past the character not to render.

You normally enter the affected characters with a combination of keys (such as Option-E + apostrophe) or with the Character Palette.

Solution

Use Key Caps or the Keyboard Viewer to see if there is an alternative way to input the special character you need. If you do not see the character you are looking for, try using a different font that can display the character you want without pressing a combination of keys.

Published Date: Oct 7, 2016

Logic Pro 7: End of stave line cannot be moved

This article has been archived and is no longer updated by Apple.
The end of a stave (staff) line cannot be moved with the Layout tool in the layout view of the Score Editor.

If a warning for a key signature change exists at the line break of a stave, the end of the stave line cannot be changed in the score layout because the end point cannot be grabbed with the Layout tool.

If you want to move the end of a stave line, you have to first remove the time signature change warning at the line break. In order to do so:

1. Deselect the option "Display Warnings at Line Breaks" in the local Score menu (**Layout** > **Clefs & Signatures**).
2. Change the layout.
3. Reselect the option "Display Warnings at Line Breaks."

Disk Utility‘s "Scan image for Restore" process doesn‘t finish in Mac OS X 10.3

This article has been archived and is no longer updated by Apple.

After using Mac OS X 10.3's Disk Utility to create a disk image of a volume, you may run into an issue in which a "Scan Image for Restore" scan won't finish. Disk Utility just sits there indefinitely.

What can you do? Force quit Disk Utility, and then perform one of our workarounds. This article applies for Mac OS X 10.3 through 10.3.9.

Tip: If you're checking out log files, the Console log displays messages such as these when the issue occurs:

```
open failed: Operation not supported asr: could not checksum slp_ipc
open failed: Operation not supported asr: could not checksum mDNSResponder
open failed: Operation not supported asr: could not checksum pppconfd
```

Solution

As a workaround, you can either:

- Create a disk image, using this method in Disk Utility: From the **Images** menu, choose **New > Image from Folder**, or...
- Open Terminal and type this (which is equivalent to "Scan Image for Restore"), then press Return:

  ```
  asr -imagescan -blockonly
  ```

  Tip: To learn more about the asr command, type "man asr" in Terminal.

Published Date: Oct 7, 2016

Remote Desktop 2 won‘t launch, says "A newer version of the package is already installed."

This article has been archived and is no longer updated by Apple.

If you updated your Remote Desktop client software to version 2.1 but still have the Remote Desktop 2.0 admin application on the same computer, the admin application won't launch when you try to open it. Instead, it will start an installation routine and display the message, "A newer version of the package is already installed."

When you click Done to close this message, the application unexpectedly quits.

This usually happens if you moved Remote Desktop from the default Applications folder (/Applications) to another location. Here's why:

If you have Remote Desktop 2.0 on your computer, Software Update will offer you one of two versions of the 2.1 update: Remote Desktop Admin Update 2.1 or Remote Desktop Client Update 2.1. It will offer you the Admin version if the Remote Desktop application is in the Applications folder, or the Client version if it's not in there. The latter case leads to a mismatch of your client and admin software, which will prevent the Remote Desktop admin application from launching.

To resolve the issue, put the Remote Desktop application back in the Applications folder. Choose Software Update from the Apple menu, and this time it will offer you the Admin update. Install it, and you're done.

Tip: The Admin update includes the Client update, but not vice versa. If you get the Admin update first, everything will get updated at once.

Published Date: Feb 18, 2012

Remote Desktop 2: Upgrade Client Software feature doesn‘t work for some clients

This article has been archived and is no longer updated by Apple.

The Upgrade Client Software feature of Remote Desktop may fail for some clients. The system log on affected clients contains the message:

localhost /System/Library/CoreServices/RemoteManagement/ARDAgent.app/Contents/MacOS/ARDAgent: CheckDestination: Package install folder is invalid.

You can resolve the issue with either of the following solutions:

- Use Disk Utility to Repair Disk Permissions on the startup volume of affected client systems, or

- Execute this command on affected client systems:

  ```
  sudo chown root:wheel /private/tmp
  ```

  This command must be run on the client system as an admin user.

Tip: If the issue affects many clients, you can use the Send UNIX Command feature in Remote Desktop 2.0 to run `chown root:wheel /private/tmp` as the `root` User. You can't do this with version 2.1 of the Remote Desktop admin application, because 2.1 does not allow 2.0 clients to be targeted for UNIX Command tasks.

Published Date: Feb 18, 2012

AirPort: How to reset the trusted networks list

This article has been archived and is no longer updated by Apple.

Your computer keeps its list of trusted AirPort networks in the AirPort preferences file, "com.apple.airport.preferences.plist". It's located here:

```
/Library/Preferences/SystemConfiguration/
```

Deleting this file will reset the list. As a result, you will see a confirmation dialog whenever you attempt to join a network that was formerly in your trusted list. You might reset the list, for example, if your computer was automatically joining a network that you'd prefer to manually authorize. To delete the preference file in AirPort 3.3 or later, do the following steps.

For Mac OS X 10.3 "Panther"

1. While connected to a wireless network, locate the preference file "com.apple.airport.preferences.plist".
2. Drag it to the Trash.
3. In the resulting Authenticate dialog, enter your administrator name and password.
4. Click the AirPort menu bar icon, and choose **Turn AirPort Off**.
5. From the same menu, turn AirPort back on.

Once AirPort is on, the system creates a new preference file. Make sure that you don't skip any steps or the list may not be reset.

For Mac OS X 10.4 "Tiger"

1. From the **Apple** menu, choose **Location > Network Preferences**.
2. From the **Show** pop-up menu, choose **AirPort**.
3. Locate the pop-up menu next to "By default, join:". If this pop-up menu is set to "A specific network," this means that you upgraded to Tiger from Panther, and you should stop here and follow the Panther steps, above, instead. Otherwise, continue to step 4.
4. Set the pop-up menu to **Preferred**, which will reveal the list of trusted networks.
5. Select any network you want to delete from the list, then click the minus (-) button to delete it.
6. Click the Apply Now button.

Published Date: Feb 18, 2012

Mac OS X 10.3.6: FireWire device stops working immediately after a software update is performed

This article has been archived and is no longer updated by Apple.

If a FireWire device stopped working immediately after updating to Mac OS X 10.3.6, download and install Mac OS X 10.3.7 or later (Mac OS X 10.3.9 is the latest version of Mac OS X 10.3.x). For example, a connected FireWire hard drive may not mount (appear on the desktop), but it may appear in System Profiler.

Important: If a third-party FireWire hard drive is connected, disconnect it before installing the 10.3.7 or later update. Reconnect it and turn it back on after installation is complete and the computer is restarted.

Clearing Recent Items can improve AppleWorks performance

This article has been archived and is no longer updated by Apple.

Does AppleWorks seem to be getting slower the longer you use it?

If so, try deleting the aliases (Mac) or shortcut files (Windows) in the Recent Items folder:

1. Locate the Recent Items folder:

   Mac OS X:
   /Users/username/Documents/AppleWorks User Data/Starting Points/Recent Items/

   Windows:
   C:\Documents and Settings\username\My Documents\AppleWorks User Data\Starting Points\Recent Items\

2. Drag the alias or shortcut files from that folder to the Trash or Recycle Bin.

If the Recent Items menu is not showing the most recent items, click here.

Power Mac G5 (Late 2004): Fans remain loud after air deflector door is replaced

This article has been archived and is no longer updated by Apple.

Important: You should always shut down your Power Mac G5 before opening its case. This avoids potential damage to internal components or the components you want to install. Do not open the computer or attempt to install items inside the computer while it is on. Refer to your owners manual for further instructions on opening the computer.

If you remove the air deflector while the Power Mac G5 (Late 2004) is powered on, the fans will change speed, increasing the noise level. The fan speed will remain this way even after you replace the air deflector and door.

To return the fans to normal speed and noise level, follow these steps:

1. Power down the computer.
2. Remove the power cord from the computer.
3. Wait 15 seconds.
4. Plug in the power cord.
5. Press the power button on the computer.

This document will be updated as more information becomes available.

Mac OS X 10.3: Retaining Energy Saver schedule preferences

This article has been archived and is no longer updated by Apple.

Mac OS X 10.3's Energy Saver preferences allows you to schedule a time for your computer to automatically start up (turn on) and shut down. However, if you click the preference window's lock icon to lock the settings (this prevents further access without a password) right after you make changes, your schedule settings won't be remembered.

Don't worry; you have a couple workarounds:

- After editing your Energy Saver schedule, open any other preference (either by clicking Show All or by choosing one from the View menu) to save the settings. Then, if you wish to lock your settings, go back into Energy Saver preferences and lock (de-authenticate) the preference.

- Or, just quit System Preferences after making your scheduling changes, *without* clicking the lock icon, and your settings will be saved. After that, if you wish, you can go back into Energy Saver preferences and lock (de-authenticate) the preference.

Note: The preference will be automatically unlocked the next time an administrator logs in.

Final Cut Express 2: Timecode Overlays not available

This article has been archived and is no longer updated by Apple.

The Final Cut Express 2 manual incorrectly states that Timecode Overlays are available in the Viewer and Canvas. Overlays are not available, but you can determine timcode information using the timecode fields as described on page 291 of the Final Cut Express 2 manual and Help documentation available from the Help menu in Final Cut Express.

Final Cut Express "Configuration Error" alert with less than 384 MB of RAM

This article has been archived and is no longer updated by Apple.

If your computer does not have enough memory, you will not be able to launch Final Cut Express.

Final Cut Express will install on a computer that has less than the minimum of 384MB of RAM, but it won't actually work in this configuration. You see this alert message:

> Configuration error
> This software requires certain hardware or software which is missing.
> • 384MB of RAM

To run Final Cut Express 2, your computer must meet all of the following minimum requirements:

- Macintosh computer with a 350MHz PowerPC G4 or G5 processor and AGP graphics card.
- RT Extreme requires a 500MHz PowerPC G4 (550MHz for PowerBook G4) or G5 processor or any dual PowerPC G4 or G5 processors.
- Mac OS X v10.2.5 or later.
- QuickTime 6.4 or later.
- 384MB of RAM (512MB required for RT Extreme).
- 40MB of available disk space required for installation.

Logic Pro 7: Automation jumps back to last value in touch mode when using Logic Control

This article has been archived and is no longer updated by Apple.
Automation may jump back to the last value after approximately two seconds, although the fader keeps being touched. This happens when using the Logic Control in touch mode.

As a workaround, use touch mode with the track's automation fader instead of the Logic Control.

This document will be updated as more information becomes available.

Some Internet radio stations don‘t play through AirTunes

This article has been archived and is no longer updated by Apple.

Some Internet radio stations that play in iTunes don't play through AirTunes, even when you've selected AirPort Express in iTunes. Instead, the radio station plays through the built-in speaker or audio-out port of the computer.

There is no workaround at this time. This document will be updated as more information becomes available.

Internet radio stations that play outside of iTunes (in a browser window or another application like QuickTime Player) do not play through AirTunes.

iCal 1.5.4: What‘s an "unsafe" alarm?

This article has been archived and is no longer updated by Apple.

iCal 1.5.4 displays an "unsafe" alarm alert when you try to import a calendar that contains existing alarms that open documents or other applications.

If you are concerned about security, either be sure to remove all unsafe alarms during the import process or don't import calendars that contain these kinds of alarms.

The alert allows you to choose whether or not you want to continue importing the calendar and its events, including all alarms. If you choose not to, click "Cancel" to stop the import process.

If you want to import everything, click "Keep All Alarms," and iCal will import all events and their respective alarms, including ones that open other documents and applications. Keep in mind that this is the least secure option.

If you want to import the calendar without the potential security issues, click "Remove Unsafe Alarms." iCal will import all events but won't import any alarms that are set to open documents or applications. It will import all event alarms that play a sound or display a message.

About the Mac OS X Server 10.3.7 Update

This article has been archived and is no longer updated by Apple.
This software updates Mac OS X Server version 10.3.6 to version 10.3.7.

Important: Read Before Installing

1. An administrator account password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If your password must be changed, follow these steps: Choose System Preferences from the Apple menu. Choose Accounts from the View menu. Select an Admin account and click Edit User. Type your current password, and press Return. Change the password, and click OK.

2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install.

4. This update can be installed on non-startup volumes, but that should be done **only** when the current startup volume has already been updated to Mac OS X Server 10.3.7. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are two ways to update to Mac OS X Server 10.3.7: Software Update and Standalone Installer.

Software Update Installation

You may have been referred to this document by Software Update. For more information on this feature, see How to Update Your Software.

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

An installer is also available from Apple Featured Software.

The Mac OS X Server 10.3.7 Update is specifically for updating version 10.3.6. There is also a "combo" installer available, which will update any 10.3.x version to 10.3.7.

Remote Installation

If you need to install the update on a remotely located computer, you can do so using either the Server Admin application or the "softwareupdate" command-line tool. Choose the method that works best for you.

Enhancements

This update includes the same changes that are found in the standard Mac OS X 10.3.7 Update. Though these items are not server-specific, they are relevant in a server environment:

- Filenames longer than 31 characters are no longer shortened when the file is saved on a server via Apple File Sharing.
- Resolves an issue in which Safari, Mail, and other networking applications that use DNS lookups could experience intermittent connectivity issues with Security Update 2004-09-30 and Mac OS X 10.3.5 or later installed.
- Resolves an issue that prevented printing to some Windows-based print servers.

Published Date: Oct 7, 2016

About the Mac OS X Server 10.3.7 Update (Combo)

This article has been archived and is no longer updated by Apple.
This software updates any version of Mac OS X Server 10.3 to 10.3.6 to Mac OS X Server version 10.3.7. It is a "combo" update that combines enhancements delivered with versions 10.3.1 through 10.3.7. If you already have Mac OS X Server 10.3.6, you may download a smaller update that is not a combo.

Important: Read Before Installing

1. An administrator account password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If your password must be changed, then follow these steps: Choose System Preferences from the Apple menu. Choose Accounts from the View menu. Select an Admin account and click Edit User. Type your current password, and press Return. Change the password, and click OK.

2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install.

4. This update can be installed on non-startup volumes, but that should be done **only** when the current startup volume has already been updated to Mac OS X Server 10.3.7. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

5. If you are updating from 10.3.2 or earlier and use a MySQL database, you must back it up prior to upgrade. See the Additional Information for MySQL section, below.

6. If you are updating from 10.3.2 or earlier and have set up a loginhook, a custom serial port configuration, or have edited the "/etc/ttys" file for other reasons, you will need to back it up prior to installation of this update.This is because a 10.3.3 or later update overwrites the file with a new copy when updating from 10.3.2 or earlier. The new file will set the Xserve's serial port to communicate at 56Kbps. If your serial device cannot communicate at this speed, you must edit this file to reduce the speed.

Installation

There are two ways to update to Mac OS X Server 10.3.7: Software Update and Standalone Installer.

Software Update Installation

You may have been referred to this document by Software Update. For more information on this feature, see How to Update Your Software.

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

An installer is also available from Apple Featured Software.

Mac OS X Server 10.3.7 Update (Combo) updates Mac OS X Server 10.3, 10.3.1, 10.3.2, 10.3.3, 10.3.4, 10.3.5, or 10.3.6 to the later version.

Remote Installation

If you need to install the update on a remotely located computer, you can do so using either the Server Admin application or the "softwareupdate" command-line tool. Choose the method that works best for you.

Enhancements Delivered with this update

Many enhancements are delivered with this update. Because this is a combo update, it includes those delivered with earlier 10.3 updates. You can see the individual lists for 10.3.1, 10.3.2, 10.3.3, 10.3.4, 10.3.5, 10.3.6, and 10.3.7.

Additional Information for MySQL

Data stored in MySQL databases with the version of MySQL that is pre-installed Mac OS X Server 10.3.2 or earlier must be exported and re-imported in order to be compatible with version of MySQL that is pre-installed on Mac OS X Server 10.3.3 or later, in which a byte-ordering issue is fixed.

As with any upgrade install, you should back up your old data. In this particular upgrade, the following process is recommended to convert the data to the correct byte ordering:

Before the upgrade, use the terminal to export the data from your pre-10.3.3 database:

```
#  mysqldump -p table > backup-file.sql
```

or

```
#  mysqldump  --opt database > backup-file.sql
```

After the upgrade, and after initializing the MySQL database, import the data:

```
#  mysql -p table < backup-file.sql
```

or

```
#  mysql  database < backup-file.sql
```

About the Mac OS X 10.3.7 Update (Delta)

This article has been archived and is no longer updated by Apple.
This software updates Mac OS X 10.3.6 to version 10.3.7. If you have version 10.3, 10.3.1, 10.3.2, 10.3.3, 10.3.4, or 10.3.5, update your software with the combo update instead.

Important: Please read before installing

- If you have a third-party FireWire hard drive connected, disconnect it before installing this update. Reconnect it and turn it back on after installation is complete and you've restarted.
- You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. (This does not apply to normal application software installation.)
- The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to update.

Installation

You have two ways to update to Mac OS X 10.3.7: Use Software Update or the standalone installer. Use just one of these methods to update your computer.

Automatic Software Update

Software Update, located in System Preferences, can automatically download and install the latest Apple software. Software Update may have linked you to this document for additional information about the update.

This update's size may vary from computer to computer when installed via Software Update.

Because some updates are prerequisites for others, you may need to run Software Update more than once to get all available updates.

Standalone installer

Two versions (delta and combo, described below) of the installer are available from Apple Downloads as standalone updates. After you download an update, you can use it without being connected to the Internet.

- The "delta" installer will update Mac OS X 10.3.6 to 10.3.7 (described in this document).
- The "combo" installer can update 10.3, 10.3.1, 10.3.2, 10.3.3, 10.3.4, 10.3.5, or 10.3.6 to 10.3.7.

The standalone installer, particularly the combo, is useful if you have multiple computers to update and only want to download the 10.3.7 update once.

Enhancements

These are some of the enhancements included with the Mac OS X 10.3.7 Update.

Applications

- Allows TextEdit to open certain RTF documents that previously wouldn't open, resulting in a "TextEdit Open Failed. Couldn't open file" alert.
- Resolves an issue in which Safari, Mail, and other networking applications that use DNS lookups could experience intermittent connectivity issues with Security Update 2004-09-30 and Mac OS X 10.3.5 or later installed.
- Addresses an issue with Blizzard World of Warcraft in which the game's frame rate could drop considerably when in "Ghost mode," if the computer uses an nVidia graphics card.
- Resolves an issue in which enabling Vertex Shaders in World of Warcraft could lead to unexpected graphics issues when using an nVidia graphics card.
- Addresses an issue with World of Warcraft in which incorrect colors or unexpectedly flashing objects could appear when using an ATI Radeon 9600 graphics card, making gameplay difficult.
- Improves compatibility for Pacific Tech's Graphing Calculator 3.5—some 3D surfaces might not render in Mac OS X 10.3.6.

Other

- Addresses an issue in which a brief "flash of lines" may appear on the screen when waking the computer from sleep after the "Flurry" Screen Saver has run, if the computer uses an ATI Radeon 8500, 9000, 9200, 9600, or M9 graphics chip.
- Improves compatibility for FireWire-based audio interfaces, including the Edirol FA-101 FireWire audio interface.
- Enables E*TRADE PDF account statements to be viewed in Preview.
- An Apple Cinema 22" ADC display, when connected to certain PowerBook computers, no longer shows random "stuttering" or other graphics anomalies in the Finder and DVD Player.
- Addresses an issue in which shadowed text in a PDF file may print differently than it appears on the screen when printing to a raster printer.
- Filenames longer than 31 characters are no longer shortened when the file is saved on a server via Apple File Sharing.
- Resolves an issue with Mac OS X 10.3.6 in which some FireWire hard drives would not appear ("mount") on the desktop.
- Addresses an issue with Mac OS X 10.3.6 in which DVD Player might not open on some Power Mac G4 computers that use an ATI Radeon 9800 AGP video card.
- Resolves an issue that prevented printing to some Windows-based print servers.

About the Mac OS X 10.3.7 Update (Combo)

This article has been archived and is no longer updated by Apple.
This software updates Mac OS X 10.3, 10.3.1, 10.3.2, 10.3.3, 10.3.4, 10.3.5 or 10.3.6 to version 10.3.7. If you have version 10.3.6, you can update your software with the smaller delta update instead.

Important: Please read before installing

- If you have a third-party FireWire hard drive connected, disconnect it before installing this update. Reconnect it and turn it back on after installation is complete and you've restarted.
- You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. (This does not apply to normal application software installation.)
- The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to update.

Installation

You have two ways to update to Mac OS X 10.3.7: Use Software Update or the standalone installer. Use just one of these methods to update your computer.

Automatic Software Update

Software Update, located in System Preferences, can automatically download and install the latest Apple software. Software Update may have linked you to this document for additional information about the update.

This update's size may vary from computer to computer when installed via Software Update.

Because some updates are prerequisites for others, you may need to run Software Update more than once to get all available updates.

Standalone installer

Two versions (combo and delta, described below) of the installer are available from Apple Downloads as standalone updates. After you download an update, you can use it without being connected to the Internet.

- The "combo" installer (described in this document) can update 10.3, 10.3.1, 10.3.2, 10.3.3, 10.3.4, 10.3.5, or 10.3.6 to 10.3.7.
- The "delta" installer will update Mac OS X 10.3.6 to 10.3.7 (described in a different document).

The standalone installer, particularly the combo, is useful if you have multiple computers to update and only want to download the 10.3.7 update once.

Enhancements

What does this update include? Check out the Enhancements section of this document for details.

This update also includes enhancements delivered with:

Mac OS X 10.3.6 Update
Mac OS X 10.3.5 Update
Mac OS X 10.3.4 Update
Mac OS X 10.3.3 Update
Mac OS X 10.3.2 Update
Mac OS X 10.3.1 Update

Not all DVD players support all media types

This article has been archived and is no longer updated by Apple.

Computers and set-top DVD players may not support all types of booktypes (media).

Some examples of different DVD media include:

- DVD-ROM
- DVD+R
- DVD-R
- DVD+RW
- DVD+R DL

Set-top DVD players
The manufacturer determines what booktypes the player supports at the time of production.

Computer DVD players
The drive, software DVD player, and the computer operating system must support the media in order for the disc to mount and play back.

For more information on supported media types and updates for specific devices, please consult the manufacturer of the device.

Symptoms of an incompatibility include:

- The disc fails to mount.
- The disc ejects automatically.
- The disc is ignored.
- The player displays error messages or codes when a disc is inserted.

See What's New in DVD Studio Pro 3.0.2 for additional information about DVD Studio Pro and support for the DVD+R DL booktype.

Unable to reinstall Remote Desktop 2.0

This article has been archived and is no longer updated by Apple.

If you're trying to uninstall Remote Desktop, as described in document 108021, and then reinstall version 2.0, your attempt might fail with one of two symptoms.

Scenario 1: see an alert message that says "A newer version of the package is already installed."

When you click Done to close this message, the Remote Desktop application unexpectedly quits. The same thing happens each time you reopen the Remote Desktop application.

Scenario 2: Remote Desktop installs necessary components each time you open it, reports that the installation was successful, and then quits. It does this each time you open it, creating a sort of "looping installation" effect.

Because you may also see an installation or setup routine each time you try to reopen Remote Desktop in scenario 1, the two scenarios can seem very similar.

Note: If your intent is to update to version 2.1 and *not* to uninstall or reinstall 2.0, please refer to document 300329 instead.

To resolve the issue, execute the following commands in a Terminal window:

Note: These steps are not for Mac OS X 10.4 Tiger. They are for 10.3.9 and earlier.

```
$ sudo rm -rf /System/Library/PreferencePanes/SharingPref.prefPane/
$ sudo rm -rf /Library/Receipts/PantherSharing.pkg/
```

You may now open the Remote Desktop application to complete the installation.

AirPort: How to update the firmware on your AirPort Extreme or AirPort Express from a Windows PC

This article has been archived and is no longer updated by Apple.
The first step in updating firmware is to connect to the base station. There are several ways you can do this. Here are two examples:

- Connect to the base station network wirelessly, or
- Connect your computer to the base station using an Ethernet cable.

Tip: If your network uses multiple base stations, roaming, wireless distribution system (WDS), or a third-party router, you might have to use different types of connections. See the "Advanced information" section below to learn more about updating over other types of connections.

How to update

After you have connected to the base station, follow these steps to update the firmware:

1. Download the firmware update for your AirPort Extreme or AirPort Express.
2. Open the Firmware Updater. It should display all available base stations.

3. Select the base station, and click the Update button. This will start the firmware update process. This process may take a few minutes while the update is transferred to your AirPort Extreme or AirPort Express.

4. Click the OK button when the application notifies you that the update is finished. You will see your base station listed with the updated firmware version. If you have more base stations to update, return to step 3. If you are done updating you can Quit the application.

Advanced information

You may connect to a base station directly or indirectly. In a **direct** connection, communication passes from your computer to the base station that's being updated without going through any other device. If you only have one base station, your connection is always direct. The examples above are direct connections.

In an **indirect** connection, communication passes through a third device (usually another base station or router) to reach the base station that is being updated. This can happen on networks configured for roaming and/or WDS, or that have third-party routers or access points. Direct connections are preferred but not required.

Base station firmware 5.3 or later improves the ability to update the base station over an indirect connection. If your base station has not been updated to firmware 5.3 or later, or if you are in the process of updating to version 5.3, a direct connection is the most reliable.

Updates over an indirect connection will not work under some circumstances when using firmware prior to 5.3, so they are not the preferred method. They do often work, however. Attempting to update over an indirect connection is worthwhile if it will save you the effort of making a direct connection to an inaccessible base station (such as one mounted in a ceiling). If the indirect update is not successful, connect directly.

Examples of indirect connection:

- You connect wirelessly to the station with network name "A", which has a wired or wireless (WDS) connection to the target base station with network name "B".
- You choose a base station's non-unique network name in the AirPort menu.
  Note: When base stations have the same network name, known as "roaming," then you may be passing through another base station to reach the target base station.

Ensuring a direct connection

If you can't use the direct methods described above, try one of these two methods:

- Temporarily rename the base stations' networks.
- Temporarily unplug all but the target base station.

This third method almost always works:

1. Locate your computer near the target base station (or vice versa).
2. On the computer, turn AirPort off in the AirPort menu.
3. Turn AirPort on again.

Your computer should associate with the nearest base station when AirPort is turned back on, though unusual circumstances or sources of interference can keep this method from being 100 percent reliable.

Apple Hardware Test for Power Mac version 2.2.5 reports fan error

This article has been archived and is no longer updated by Apple.

Apple Hardware Test may incorrectly report the error "2FAN/4/8 : Rear Fan 0" on Power Mac G5 (Late 2004) computers if the air deflector is not installed. (Remember that the air deflector should always be installed when the computer is running.)

It is possible that the error does not indicate an actual fan failure. To verify whether it is a genuine failure, follow the steps below to reset the SMU, make sure that the air deflector is properly installed, and run the test again:

1. Shut down the computer.
2. Disconnect the power cord from the wall socket (or from the power strip) and wait at least 15 seconds.
3. While you're waiting at least 15 seconds, open the door on the Power Mac G5 and make sure the plastic air deflector is firmly in place.

4. Reconnect the power cord and start up the computer.
5. Run the Apple Hardware Test again. If the error persists, have the computer serviced.

Mac OS X 10.2: iSync quits or can‘t sync to Symbian OS-based phone after installing iCal 1.5.4

This article has been archived and is no longer updated by Apple.

If your computer has Mac OS X 10.2.3 through 10.2.8 and iCal 1.5.4 installed, and iSync is configured to sync with a Symbian OS-based phone, iSync might unexpectedly quit when opening or syncing.

iSync may also quit when adding a Symbian OS-based phone.

To resolve the issue, download and install iCal 1.5.5.

Mac OS X Server: WebDAV .DS_Store protection added by Security Update 2004-12-02

This article has been archived and is no longer updated by Apple.
Server Security Update 2004-12-02 modifies the Web Server configuration file. If the update is successful, files named ".DS_Store" will be blocked (unavailable to Web browsers or WebDAV clients). Please see article 300422 for the technical details. This improves security but can degrade the experience for WebDAV users who are working in the Finder. Similar to a read-only volume, client metadata for folders on mounted WebDAV volumes, such as icon positions and view options, will not be persistent from one login to the next.

WebDAV users who use the Finder to copy a folder that contains a .DS_Store file may see this alert message:

"The item <folder-name> contains one or more items you do not have permission to read. Do you want to copy the items you are allowed to read?"

In this case, instruct your users to click Continue to direct the Finder to copy the folder. All files except for the .DS_Store files should be copied.

When such clients access WebDAV volumes, expect to see many entries like this in the Apache error log:

```
[Tue Nov 16 13:15:26 2004] [error] [client 192.0.34.166] client denied by server configuration:
/Library/WebServer/Documents/dav/.DS_Store
```

Such errors are harmless and can be ignored.

Mac OS X, Mac OS X Server: Protection for sensitive files when using Apache on an HFS+ volume

This article has been archived and is no longer updated by Apple.

Security Update 2004-12-02 makes changes to the httpd.conf file. After a successful update, the Apache configuration file will deny access to the following files:

- */..namedfork/data
- */..namedfork/rsrc
- */rsrc
- rsrc
- .ht* (case insensitive)
- .ds_s* (case insensitive)

Warnings:

1. The configuration changes that block named-fork exposure apply only to the default webserver, apache1. If you've chosen to use Apache2, it's recommended that you serve content from a UFS volume.
2. For important related information, see "mod_hfs_apple" protects web content against case insensitivity in the HFS file system.

Blocking these files improves security, but it may impact applications that either provide resource fork content via a web server (no Apple applications do) or store files called "rsrc".

If clients attempt to access blocked files, the Apache error log will create a record. By default, Apache writes log files into /private/var/log/httpd. Here's what this example would look like:

```
[Tue Nov 16 13:15:26 2004] [error] [client 1.2.3.4] client denied by server configuration:
/Library/WebServer/Documents/rsrc
```

In some circumstances, the Security Update may not install successfully if the Web Server configuration file has been manually edited or has been updated by installing certain third-party software.

If the Security Update can't successfully modify the Web Server configuration file, this entry will appear in system install log (/var/log/install.log):

```
## WARNING #############################################################
The Security Update was unable to safely apply a patch to your Apache
config file, /etc/httpd/httpd.conf. It has been left undisturbed.

Please look at /etc/httpd/httpd.conf.default and consider merging the
new Files 'rsrc' and DirectoryMatch '..namedfork' directives from that
file into /etc/httpd/httpd.conf.

######################################################################
```

If this occurs, we highly recommend that you edit your /etc/httpd/httpd.conf file manually, as follows.

An unpatched configuration file will contain one of the following three alternative sections:

- ```
  <Files ~ "^\.ht">
      Order allow,deny
      Deny from all
      Satisfy All
  </Files>
  ```

- ```
  <Files ~ "^\.([Hh][Tt])">
      Order allow,deny
      Deny from all
      Satisfy All
  </Files>
  ```

- ```
  <Files ~ "^\.([Hh][Tt]|[Dd][Ss]_[Ss])">
      Order allow,deny
      Deny from all
      Satisfy All
  </Files>
  ```

Whichever section appears, replace it with **all** of the following:

```
<Files ~ "^\.([Hh][Tt]|[Dd][Ss]_[Ss])">
    Order allow,deny
    Deny from all
```
```

```
    Satisfy All
</Files>

<Files "rsrc">
    Order allow,deny
    Deny from all
    Satisfy All
</Files>

<DirectoryMatch ".*\.\.namedfork">
    Order allow,deny
    Deny from all
    Satisfy All
</DirectoryMatch>
```

Additional information

Security Update 2004-12-02 may update Mac OS X client with a copy of the Apache default configuration file (httpd.conf.default) that is intended for Mac OS X Server. The default file is provided in Mac OS X client only as a reference in the event that user-made changes to the active configuration file result in a need to revert back to a known-good default copy. You can restore a Mac OS X client httpd.conf.default file to the correct state by opening it in a text editor and replacing its contents with the copy found below. The copy below is **only** for Mac OS X 10.2.8 or 10.3.6 with Security Update 2004-12-02 installed.

Begin copying below this line.

```
##
## httpd.conf -- Apache HTTP server configuration file
##

#
# Based upon the NCSA server configuration files originally by Rob McCool.
#
# This is the main Apache server configuration file.  It contains the
# configuration directives that give the server its instructions.
# See <URL:http://httpd.apache.org/docs/> for detailed information about
# the directives.
#
# Do NOT simply read the instructions in here without understanding
# what they do.  They're here only as hints or reminders.  If you are unsure
# consult the online docs. You have been warned.
#
# After this file is processed, the server will look for and process
# /private/etc/httpd/srm.conf and then /private/etc/httpd/access.conf
# unless you have overridden these with ResourceConfig and/or
# AccessConfig directives here.
#
# The configuration directives are grouped into three basic sections:
#  1. Directives that control the operation of the Apache server process as a
#     whole (the 'global environment').
#  2. Directives that define the parameters of the 'main' or 'default' server,
#     which responds to requests that aren't handled by a virtual host.
#     These directives also provide default values for the settings
#     of all virtual hosts.
#  3. Settings for virtual hosts, which allow Web requests to be sent to
#     different IP addresses or hostnames and have them handled by the
#     same Apache server process.
#
# Configuration and logfile names: If the filenames you specify for many
# of the server's control files begin with "/" (or "drive:/" for Win32), the
# server will use that explicit path.  If the filenames do *not* begin
# with "/", the value of ServerRoot is prepended -- so "logs/foo.log"
# with ServerRoot set to "/usr/local/apache" will be interpreted by the
# server as "/usr/local/apache/logs/foo.log".
#

### Section 1: Global Environment
#
# The directives in this section affect the overall operation of Apache,
# such as the number of concurrent requests it can handle or where it
# can find its configuration files.
#

#
# ServerType is either inetd, or standalone.  Inetd mode is only supported on
# Unix platforms.
#
ServerType standalone

#
```

```
# ServerRoot: The top of the directory tree under which the server's
# configuration, error, and log files are kept.
#
# NOTE!  If you intend to place this on an NFS (or otherwise network)
# mounted filesystem then please read the LockFile documentation
# (available at <URL:http://www.apache.org/docs/mod/core.html#lockfile>);
# you will save yourself a lot of trouble.
#
ServerRoot "/usr"

#
# The LockFile directive sets the path to the lockfile used when Apache
# is compiled with either USE_FCNTL_SERIALIZED_ACCEPT or
# USE_FLOCK_SERIALIZED_ACCEPT. This directive should normally be left at
# its default value. The main reason for changing it is if the logs
# directory is NFS mounted, since the lockfile MUST BE STORED ON A LOCAL
# DISK. The PID of the main server process is automatically appended to
# the filename.
#
#LockFile "/private/var/run/httpd.lock"

#
# PidFile: The file in which the server should record its process
# identification number when it starts.
#
PidFile "/private/var/run/httpd.pid"

#
# ScoreBoardFile: File used to store internal server process information.
# Not all architectures require this.  But if yours does (you'll know because
# this file will be  created when you run Apache) then you *must* ensure that
# no two invocations of Apache share the same scoreboard file.
#
ScoreBoardFile "/private/var/run/httpd.scoreboard"

#
# In the standard configuration, the server will process httpd.conf (this
# file, specified by the -f command line option), srm.conf, and access.conf
# in that order.  The latter two files are now distributed empty, as it is
# recommended that all directives be kept in a single file for simplicity.
# The commented-out values below are the built-in defaults.  You can have the
# server ignore these files altogether by using "/dev/null" (for Unix) or
# "nul" (for Win32) for the arguments to the directives.
#
#ResourceConfig /private/etc/httpd/srm.conf
#AccessConfig /private/etc/httpd/access.conf

#
# Timeout: The number of seconds before receives and sends time out.
#
Timeout 300

#
# KeepAlive: Whether or not to allow persistent connections (more than
# one request per connection). Set to "Off" to deactivate.
#
KeepAlive On

#
# MaxKeepAliveRequests: The maximum number of requests to allow
# during a persistent connection. Set to 0 to allow an unlimited amount.
# We recommend you leave this number high, for maximum performance.
#
MaxKeepAliveRequests 100

#
# KeepAliveTimeout: Number of seconds to wait for the next request from the
# same client on the same connection.
#
KeepAliveTimeout 15

#
# Server-pool size regulation.  Rather than making you guess how many
# server processes you need, Apache dynamically adapts to the load it
# sees --- that is, it tries to maintain enough server processes to
# handle the current load, plus a few spare servers to handle transient
# load spikes (e.g., multiple simultaneous requests from a single
# Netscape browser).
#
# It does this by periodically checking how many servers are waiting
# for a request.  If there are fewer than MinSpareServers, it creates
```

```
# a new spare.  If there are more than MaxSpareServers, some of the
# spares die off.  The default values are probably OK for most sites.
#
MinSpareServers 1
MaxSpareServers 5

#
# Number of servers to start initially --- should be a reasonable ballpark
# figure.
#
StartServers 1

#
# Limit on total number of servers running, i.e., limit on the number
# of clients who can simultaneously connect --- if this limit is ever
# reached, clients will be LOCKED OUT, so it should NOT BE SET TOO LOW.
# It is intended mainly as a brake to keep a runaway server from taking
# the system with it as it spirals down...
#
MaxClients 150

#
# MaxRequestsPerChild: the number of requests each child process is
# allowed to process before the child dies.  The child will exit so
# as to avoid problems after prolonged use when Apache (and maybe the
# libraries it uses) leak memory or other resources.  On most systems, this
# isn't really needed, but a few (such as Solaris) do have notable leaks
# in the libraries. For these platforms, set to something like 10000
# or so; a setting of 0 means unlimited.
#
# NOTE: This value does not include keepalive requests after the initial
#       request per connection. For example, if a child process handles
#       an initial request and 10 subsequent "keptalive" requests, it
#       would only count as 1 request towards this limit.
#
MaxRequestsPerChild 100000

#
# Listen: Allows you to bind Apache to specific IP addresses and/or
# ports, instead of the default. See also the <VirtualHost>
# directive.
#
#Listen 3000
#Listen 12.34.56.78:80

#
# BindAddress: You can support virtual hosts with this option. This directive
# is used to tell the server which IP address to listen to. It can either
# contain "*", an IP address, or a fully qualified Internet domain name.
# See also the <VirtualHost> and Listen directives.
#
#BindAddress *

#
# Dynamic Shared Object (DSO) Support
#
# To be able to use the functionality of a module which was built as a DSO you
# have to place corresponding `LoadModule' lines at this location so the
# directives contained in it are actually available _before_ they are used.
# Please read the file http://httpd.apache.org/docs/dso.html for more
# details about the DSO mechanism and run `httpd -l' for the list of already
# built-in (statically linked and thus always available) modules in your httpd
# binary.
#
# Note: The order in which modules are loaded is important.  Don't change
# the order below without expert advice.
#
# Example:
# LoadModule foo_module libexec/mod_foo.so
#LoadModule vhost_alias_module libexec/httpd/mod_vhost_alias.so
#LoadModule env_module         libexec/httpd/mod_env.so
LoadModule config_log_module  libexec/httpd/mod_log_config.so
#LoadModule mime_magic_module  libexec/httpd/mod_mime_magic.so
LoadModule mime_module        libexec/httpd/mod_mime.so
LoadModule negotiation_module libexec/httpd/mod_negotiation.so
#LoadModule status_module      libexec/httpd/mod_status.so
#LoadModule info_module        libexec/httpd/mod_info.so

#
# ExtendedStatus controls whether Apache will generate "full" status
# information (ExtendedStatus On) or just basic information (ExtendedStatus
# Off) when the "server-status" handler is called. The default is Off.
#
#ExtendedStatus On

### Section 2: 'Main' server configuration
#
# The directives in this section set up the values used by the 'main'
```

```
# server, which responds to any requests that aren't handled by a
# <VirtualHost> definition.  These values also provide defaults for
# any <VirtualHost> containers you may define later in the file.
#
# All of these directives may appear inside <VirtualHost> containers,
# in which case these default settings will be overridden for the
# virtual host being defined.
#

#
# If your ServerType directive (set earlier in the 'Global Environment'
# section) is set to "inetd", the next few directives don't have any
# effect since their settings are defined by the inetd configuration.
# Skip ahead to the ServerAdmin directive.
#

#
# Port: The port to which the standalone server listens. For
# ports < 1023, you will need httpd to be run as root initially.
#
Port 80

#
# If you wish httpd to run as a different user or group, you must run
# httpd as root initially and it will switch.
#
# User/Group: The name (or #number) of the user/group to run httpd as.
#  . On SCO (ODT 3) use "User nouser" and "Group nogroup".
#  . On HPUX you may not be able to use shared memory as nobody, and the
#    suggested workaround is to create a user www and use that user.
#  NOTE that some kernels refuse to setgid(Group) or semctl(IPC_SET)
#  when the value of (unsigned)Group is above 60000;
#  don't use Group "#-1" on these systems!
#
User www
Group www

#
# ServerAdmin: Your address, where problems with the server should be
# e-mailed.  This address appears on some server-generated pages, such
# as error documents.
#
#ServerAdmin webmaster@example.com

#
# ServerName allows you to set a host name which is sent back to clients for
# your server if it's different than the one the program would get (i.e., use
# "www" instead of the host's real name).
#
# Note: You cannot just invent host names and hope they work. The name you
# define here must be a valid DNS name for your host. If you don't understand
# this, ask your network administrator.
# If your host doesn't have a registered DNS name, enter its IP address here.
# You will have to access it by its address (e.g., http://123.45.67.89/)
# anyway, and this will make redirections work in a sensible way.
#
# 127.0.0.1 is the TCP/IP local loop-back address, often named localhost. Your
# machine always knows itself by this address. If you use Apache strictly for
# local testing and development, you may use 127.0.0.1 as the server name.
#
#ServerName homeslice.apple.com

#
# DocumentRoot: The directory out of which you will serve your
# documents. By default, all requests are taken from this directory, but
# symbolic links and aliases may be used to point to other locations.
#
DocumentRoot "/Library/WebServer/Documents"

#
# Each directory to which Apache has access, can be configured with respect
# to which services and features are allowed and/or disabled in that
# directory (and its subdirectories).
#
# First, we configure the "default" to be a very restrictive set of
# permissions.
#
<Directory />
    Options FollowSymLinks
    AllowOverride None
</Directory>
```

```
#
# Note that from this point forward you must specifically allow
# particular features to be enabled - so if something's not working as
# you might expect, make sure that you have specifically enabled it
# below.
#

#
# This should be changed to whatever you set DocumentRoot to.
#
<Directory "/Library/WebServer/Documents">

#
# This may also be "None", "All", or any combination of "Indexes",
# "Includes", "FollowSymLinks", "ExecCGI", or "MultiViews".
#
# Note that "MultiViews" must be named *explicitly* --- "Options All"
# doesn't give it to you.
#
    Options Indexes FollowSymLinks MultiViews

#
# This controls which options the .htaccess files in directories can
# override. Can also be "All", or any combination of "Options", "FileInfo",
# "AuthConfig", and "Limit"
#
    AllowOverride None

#
# Controls who can get stuff from this server.
#
    Order allow,deny
    Allow from all
</Directory>

#
# UserDir: The name of the directory which is appended onto a user's home
# directory if a ~user request is received.
#
<IfModule mod_userdir.c>
    UserDir Sites
</IfModule>

#
# Control access to UserDir directories.  The following is an example
# for a site where these directories are restricted to read-only.
#
#<Directory /Users/*/Sites>
#    AllowOverride FileInfo AuthConfig Limit
#    Options MultiViews Indexes SymLinksIfOwnerMatch IncludesNoExec
#    <Limit GET POST OPTIONS PROPFIND>
#        Order allow,deny
#        Allow from all
#    </Limit>
#    <LimitExcept GET POST OPTIONS PROPFIND>
#        Order deny,allow
#        Deny from all
#    </LimitExcept>
#</Directory>

#
# DirectoryIndex: Name of the file or files to use as a pre-written HTML
# directory index.  Separate multiple entries with spaces.
#
<IfModule mod_dir.c>
    DirectoryIndex index.html
</IfModule>

#
# AccessFileName: The name of the file to look for in each directory
# for access control information.
#
AccessFileName .htaccess

#
# The following lines prevent .htaccess files from being viewed by
# Web clients.  Since .htaccess files often contain authorization
# information, access is disallowed for security reasons.  Comment
# these lines out if you want Web visitors to see the contents of
# .htaccess files.  If you change the AccessFileName directive above,
```

```
# be sure to make the corresponding changes here.
#
# Also, folks tend to use names such as .htpasswd for password
# files, so this will protect those as well.
#
<Files ~ "^<.([Hh][Tt]|[Dd][Ss]_[Ss])">
    Order allow,deny
    Deny from all
    Satisfy All
</Files>

#
# Apple specific filesystem protection.
#

<Files "rsrc">
    Order allow,deny
    Deny from all
    Satisfy All
</Files>

<Directory  ~ ".\.\.namedfork">
    Order allow,deny
    Deny from all
    Satisfy All
</Directory>

#
# CacheNegotiatedDocs: By default, Apache sends "Pragma: no-cache" with each
# document that was negotiated on the basis of content. This asks proxy
# servers not to cache the document. Uncommenting the following line disables
# this behavior, and proxies will be allowed to cache the documents.
#
#CacheNegotiatedDocs

#
# UseCanonicalName:  (new for 1.3)  With this setting turned on, whenever
# Apache needs to construct a self-referencing URL (a URL that refers back
# to the server the response is coming from) it will use ServerName and
# Port to form a "canonical" name.  With this setting off, Apache will
# use the hostname:port that the client supplied, when possible.  This
# also affects SERVER_NAME and SERVER_PORT in CGI scripts.
#
UseCanonicalName On

#
# TypesConfig describes where the mime.types file (or equivalent) is
# to be found.
#
<IfModule mod_mime.c>
    TypesConfig /private/etc/httpd/mime.types
</IfModule>

#
# DefaultType is the default MIME type the server will use for a document
# if it cannot otherwise determine one, such as from filename extensions.
# If your server contains mostly text or HTML documents, "text/plain" is
# a good value.  If most of your content is binary, such as applications
# or images, you may want to use "application/octet-stream" instead to
# keep browsers from trying to display binary files as though they are
# text.
#
DefaultType text/plain

#
# The mod_mime_magic module allows the server to use various hints from the
# contents of the file itself to determine its type.  The MIMEMagicFile
# directive tells the module where the hint definitions are located.
# mod_mime_magic is not part of the default server (you have to add
# it yourself with a LoadModule [see the DSO paragraph in the 'Global
# Environment' section], or recompile the server and include mod_mime_magic
# as part of the configuration), so it's enclosed in an <IfModule> container.
# This means that the MIMEMagicFile directive will only be processed if the
# module is part of the server.
#
<IfModule mod_mime_magic.c>
    MIMEMagicFile /private/etc/httpd/magic
</IfModule>

#
# HostnameLookups: Log the names of clients or just their IP addresses
```

```
# e.g., www.apache.org (on) or 204.62.129.132 (off).
# The default is off because it'd be overall better for the net if people
# had to knowingly turn this feature on, since enabling it means that
# each client request will result in AT LEAST one lookup request to the
# nameserver.
#
HostnameLookups Off

#
# ErrorLog: The location of the error log file.
# If you do not specify an ErrorLog directive within a <VirtualHost>
# container, error messages relating to that virtual host will be
# logged here.  If you *do* define an error logfile for a <VirtualHost>
# container, that host's errors will be logged there and not here.
#
ErrorLog "/private/var/log/httpd/error_log"

#
# LogLevel: Control the number of messages logged to the error_log.
# Possible values include: debug, info, notice, warn, error, crit,
# alert, emerg.
#
LogLevel warn

#
# The following directives define some format nicknames for use with
# a CustomLog directive (see below).
#
LogFormat "%h %l %u %t <"%r<" %>s %b <"%{Referer}i<" <"%{User-Agent}i<"" combined
LogFormat "%h %l %u %t <"%r<" %>s %b" common
LogFormat "%{Referer}i -> %U" referer
LogFormat "%{User-agent}i" agent

#
# The location and format of the access logfile (Common Logfile Format).
# If you do not define any access logfiles within a <VirtualHost>
# container, they will be logged here.  Contrariwise, if you *do*
# define per-<VirtualHost> access logfiles, transactions will be
# logged therein and *not* in this file.
#
CustomLog "/private/var/log/httpd/access_log" common

#
# If you would like to have agent and referer logfiles, uncomment the
# following directives.
#
#CustomLog "/private/var/log/httpd/referer_log" referer
#CustomLog "/private/var/log/httpd/agent_log" agent

#
# If you prefer a single logfile with access, agent, and referer information
# (Combined Logfile Format) you can use the following directive.
#
#CustomLog "/private/var/log/httpd/access_log" combined

#
# Optionally add a line containing the server version and virtual host
# name to server-generated pages (error documents, FTP directory listings,
# mod_status and mod_info output etc., but not CGI generated documents).
# Set to "EMail" to also include a mailto: link to the ServerAdmin.
# Set to one of:  On | Off | EMail
#
ServerSignature On

# EBCDIC configuration:
# (only for mainframes using the EBCDIC codeset, currently one of:
# Fujitsu-Siemens' BS2000/OSD, IBM's OS/390 and IBM's TPF)!!
# The following default configuration assumes that "text files"
# are stored in EBCDIC (so that you can operate on them using the
# normal POSIX tools like grep and sort) while "binary files" are
# stored with identical octets as on an ASCII machine.
#
# The directives are evaluated in configuration file order, with
# the EBCDICConvert directives applied before EBCDICConvertByType.
#
# If you want to have ASCII HTML documents and EBCDIC HTML documents
# at the same time, you can use the file extension to force
# conversion off for the ASCII documents:
# > AddType       text/html .ahtml
# > EBCDICConvert Off=InOut .ahtml
#
```

```
# EBCDICConvertByType  On=InOut text/* message/* multipart/*
# EBCDICConvertByType  On=In    application/x-www-form-urlencoded
# EBCDICConvertByType  On=InOut application/postscript model/vrml
# EBCDICConvertByType Off=InOut */*

#
# Aliases: Add here as many aliases as you need (with no limit). The format is
# Alias fakename realname
#
<IfModule mod_alias.c>

    #
    # Note that if you include a trailing / on fakename then the server will
    # require it to be present in the URL.  So "/icons" isn't aliased in this
    # example, only "/icons/".  If the fakename is slash-terminated, then the
    # realname must also be slash terminated, and if the fakename omits the
    # trailing slash, the realname must also omit it.
    #
    Alias /icons/ "/usr/share/httpd/icons/"

# End of proxy directives.

### Section 3: Virtual Hosts
#
# VirtualHost: If you want to maintain multiple domains/hostnames on your
# machine you can setup VirtualHost containers for them. Most configurations
# use only name-based virtual hosts so the server doesn't need to worry about
# IP addresses. This is indicated by the asterisks in the directives below.
#
# Please see the documentation at <URL:http://www.apache.org/docs/vhosts/>
# for further details before you try to setup virtual hosts.
#
# You may use the command line option '-S' to verify your virtual host
# configuration.

#
# Use name-based virtual hosting.
#
#NameVirtualHost *:80

#
# VirtualHost example:
# Almost any Apache directive may go into a VirtualHost container.
# The first VirtualHost section is used for requests without a known
# server name.
#
#<VirtualHost *:80>
#    ServerAdmin webmaster@dummy-host.example.com
#    DocumentRoot /www/docs/dummy-host.example.com
#    ServerName dummy-host.example.com
#    ErrorLog logs/dummy-host.example.com-error_log
#    CustomLog logs/dummy-host.example.com-access_log common
#</VirtualHost>

<IfModule mod_php4.c>

Logic Pro 7: Bouncing a DAE output creates an empty audio file

This article has been archived and is no longer updated by Apple.
After clicking the Bounce button on a DAE output channel and confirming the Bounce dialog, you may come across a situation in which no progress bar appears and the bounce seems to be performed faster than usual (it's done in a few seconds). The resulting audio file contains only silence.

This will happen if the bounce mode for Direct TDM tracks is set to Offline. In this case, the bounce mode setting for Direct TDM is taken into account although the bounce process is triggered in DAE. Thus, Logic tries to perform an offline bounce for DAE, which is not possible. DAE can only be bounced in realtime.

This issue is fixed in Logic Pro 7.1, in which DAE bounces no longer use the settings for DTDM.

To resolve this issue in Logic 7.0, switch the bounce setting for Direct TDM to Realtime before bouncing the DAE output. This setting has to be changed only once and is stored in the preferences. (If an output object for Direct TDM already exists in your environment, skip to step 4).

1. Create a new audio object in the Environment window, using the local menu function New > Audio Object.
2. Double-click the new object to display it in extended view.
3. Assign the object's Device setting to Direct TDM, and set the Channel output to ESB 1-2.

The Direct TDM Output object in the Environment window

4. Click the Bounce button on the Direct TDM output channel to open the Bounce dialog.
5. In the Bounce Mode options, select Realtime.
6. Click the Cancel button in the Bounce dialog (this cancels the bounce, but saves the Bounce Mode setting).
7. Bounce the DAE output.

The Bounce dialog with Bounce Mode set to Realtime

This document will be updated as more information becomes available.

Logic Express 7: Audio tracks won‘t record as expected in Cycle Record

This article has been archived and is no longer updated by Apple.
The "Auto Create Tracks in Cycle Record" option does not work with audio recordings in Logic Express 7. Logic Express supports this option with MIDI tracks only. Although you can activate the option, audio will only be recorded during the first cycle. With MIDI recordings, the tracks are created as expected.

Logic Pro 7 supports the recording of audio tracks with this feature.

iMac G5 internal Bluetooth module shows that it‘s "Not Available"

This article has been archived and is no longer updated by Apple.

If you have an iMac G5 computer with an internal Bluetooth module that isn't accepting input from your Apple Wireless Keyboard and Apple Wireless Mouse, here's how to troubleshoot the issue.

Here's an example of what a "Not Available" Bluetooth menu icon will look like:

If Bluetooth reports that it's "Not Available" and you are using an iMac G5 with an internal Bluetooth module, try these steps:

1. Unplug all USB accessories from the computer.
2. Shut down the computer (if necessary, by pressing and holding the power button on the back of the computer).
3. Remove the power cord from the computer for one minute.
4. Plug the computer back in and start it up, leaving all USB accessories disconnected. The Bluetooth keyboard and mouse should pair normally at this point—test them to be sure.
5. Reconnect the USB devices.

If your Bluetooth keyboard and mouse worked as expected after start up, this indicates that one of your USB accessories is not compliant to the USB standard. You can do two things here—you can figure out which device is causing the issue, and you can follow our tips to keep the issue from happening again.

If you want to avoid this issue in the future, try these tips:

- Do not turn off your computer—instead, set it to sleep when you're using it. If you need to restart the computer, unplug all USB devices and wait until your computer has completely restarted and is ready before you reconnect them.
- Connect USB devices to a self-powered USB 2.0-compliant hub instead of connecting them directly to your iMac G5.
- Unplug all USB devices when you shut down your computer. You can plug them back in once the computer has restarted and the Desktop has loaded.

If you want to isolate which USB device is causing the issue:

1. Plug in only one of your USB devices, such as a hub, and then restart your computer.
2. If the issue occurs (your computer doesn't recognize your Apple Wireless Keyboard or Apple Wireless Mouse, and says that Bluetooth is "Not Available"), the connected USB device is the one that's non-compliant and the cause of the issue.
3. If, however, the issue does not occur and your Bluetooth devices function normally, plug in one more USB device and then restart your computer again to see if the issue crops up. Keep doing this until the issue occurs again. Once the issue occurs, the last device you plugged in is the non-compliant one.
4. Once you've isolated which USB accessory is not compliant, you can contact the manufacturer of that device for more assistance.

If this is not the issue causing your keyboard and mouse not to be recognized, check to make sure that Bluetooth is on. Check the Bluetooth menu icon in the menu bar; if the icon is dimmed, Bluetooth is off. (If there's no menu icon available, from the **Apple** menu, choose **System Preferences**, then click Bluetooth.) If you accidentally turned Bluetooth off, you can turn Bluetooth back on from its menu icon or from its preference pane.

If you checked and can confirm that Bluetooth is on and working, follow the steps in article 86496, "Apple Wireless Keyboard and Mouse: Troubleshooting Connection Issues."

Final Cut Pro HD - Canvas appears slightly blurry

This article has been archived and is no longer updated by Apple.

Some users have reported that the Canvas window will show video that is slightly blurred or softened when the video is playing back.

This can occur on configurations running Final Cut Pro HD (4.5) under Mac OS X 10.3.6 or Mac OS X 10.3.5 with NVIDIA graphics cards. This issue does not affect the final output, and should only appear in the Canvas when the video is in motion; when the playhead is still, the Canvas should display normally.

This issue is addressed in the Mac OS X 10.3.7 Update. Please update to Mac OS X 10.3.7.

Workgroup Cluster: Power Requirements and Considerations

This article has been archived and is no longer updated by Apple.

Apple Workgroup Clusters ship with various uninterruptible power supply (UPS) sizes. Some of these UPS systems include plug shapes that may not be available at your installation site. Read on to learn about plug shapes and electrical current considerations..

Type	Plug	Socket
NEMA 5-15 This is the most common plug shape in the U.S. and Canada. It has two vertical prongs, one slightly larger than the other, and a third, round prong for ground. It supports 15 amps of current at 120V.		
NEMA 5-20 This plug, which supports 20 amps of 120V current, is also common in institutional environments. Compared to the NEMA 5-15, one of the NEMA 5-20 plug's top two prongs is rotated 90 degrees.		
NEMA L5-30 This plug is typically found in server rooms or in places where it has been specially installed for high-current equipment. This plug type is used on circuits that support 30 amps at 120 volts.		

Each Xserve G5 Cluster Node requires approximately 2 amps of current at 120V. You should ensure that the outlet you're using is capable of sustaining the total current of your cluster system, including Xserves, switches, and fans.

The current requirements for each device are documented in the product manual. The current (in amps) required by the servers, which will make up the majority of your circuit load, is equal to the number of Xserve G5 servers multiplied by 2 (at U.S. and Canadian voltage). You should also leave some headroom in your circuit capacity—typically, about an amp or two per circuit. If you do not have an outlet capable of supporting the load of your entire Apple Workgroup Cluster, you must split the systems across two or more independent circuits.

Beginning in December 2004, all Apple Workgroup Cluster systems now ship with APC Smart-UPS 1000VA UPSs. You should connect *only* the head node of your cluster to this UPS. Cluster nodes are not as essential to protect with the UPS since the risk of data loss is highest on the head node during a power failure. (No non-volatile data is stored on cluster nodes.) APC Smart-UPS 1000VA UPSs have NEMA 5-15 connectors.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Xsan mounts will fail if they have the same name

This article has been archived and is no longer updated by Apple.
Xsan will not mount any volume that has the same name as any existing volume or folder located at /Volumes/.

Unlike some mounting mechanisms that automatically resolve name conflicts (for example, the Finder will append characters to each mounted volume name), the Xsan backend agent simply won't mount the volumes.

To avoid this issue, create a unique name for each volume to be mounted.

Published Date: Oct 11, 2016

Xsan won‘t let you rename a volume by changing only the letter case

This article has been archived and is no longer updated by Apple.

If you try to change the letter case of a volume name, but not the actual name, you'll encounter the alert message, "Error while writing settings (could not create config file)." If you want to do this, you'll need to first rename the volume to a different name, and then change it back to the original name with the desired case-sensitive spelling.

Logic Pro 7 and Logic Express 7: Previously recorded Regions are "grayed out" with Auto Mute in Cycle Record option

This article has been archived and is no longer updated by Apple.
If you Cycle Record with the "Auto Mute in Cycle Record" option enabled, only the last recorded cycle will appear active. Any cycle regions that you previously recorded in the take will be muted and therefore appear dimmed (grayed out) and with a bullet (•) in front of the region name.

To unmute regions, use the Mute tool (from the Toolbox) —not the Mute button on the track. You can also select a Region and press M on the keyboard to mute or unmute it.

The benefit of this option is that it allows you to comfortably record take after take without starting and stopping Logic. After the take, you may mute and unmute the Regions individually to compare and composite the different takes.

If you don't want Logic to automatically mute Regions in cycle record, uncheck The Auto Mute in Cycle Record option in **File** > **Song Settings** > **Recording**.

AirTunes: Display won‘t sleep when streaming to AirPort Express

This article has been archived and is no longer updated by Apple.
When iTunes is playing music to AirPort Express, your computer's display won't go to sleep (power down) automatically after a period of inactivity, because it is actively streaming music.

This happens when using:

- iTunes 4.7
- AirPort Express with version 6.1 firmware
- Mac OS X 10.3 or later

Update to iTunes 4.7.1 or later.
Published Date: Oct 7, 2016

Final Cut Pro HD: LiveType does not appear in the External Editors tab

This article has been archived and is no longer updated by Apple.

Under some circumstances, the External Editors tab (choose **Final Cut Pro HD** > **System Settings**) in Final Cut Pro HD does not display a setting for "LiveType Movie Files."

This can happen if you installed Final Cut Pro HD from a new Final Cut Pro HD disc, as opposed to installing it from an upgrade. If you upgraded from Final Cut Pro 4 to Final Cut Pro HD, you will not have this issue. If you upgraded from an earlier version of Final Cut Pro using an upgrade disc, you will not have this issue.

You can still add LiveType files to the timeline even if LiveType does not appear in the External Editors tab. The behavior may be slightly different, depending on whether you add a LiveType project file or a LiveType movie file to the Timeline.

- If you add a LiveType project file (for example, MyProject.ipr) to the Timeline and then choose to open it in an External Editor, the file will open automatically in LiveType as a LiveType project.

- If you add a rendered LiveType movie file to the Timeline and then choose to open it in an External Editor, the file will open in the Editor you've selected for Video Files (in the External Editors tab) or in QuickTime Player if none is selected.

The External Editors tab in System Settings. Note that the bottom option, "LiveType Movie Files," only appears if you *upgrade* to Final Cut Pro HD from an earlier version of Final Cut Pro 4.

RAID Admin 1.3.2 with Firmware 1.3.1-1.24 will ignore LUN masking settings

This article has been archived and is no longer updated by Apple.

If you install Xserve RAID Firmware version 1.3.1-1.24 that came with the Xserve RAID Admin 1.3.2 Update, LUN masking settings that were made using the RAID Admin application will not be properly set.

Symptom

If you use RAID Admin to specify LUN masking settings for your Xserve RAID, the settings will appear to be set properly in RAID Admin, but the LUN masking settings will not be enforced by the Xserve RAID. All hosts on the same Fibre Channel network as the Xserve RAID will be able to access all LUNs.

Solution

This issue has been addressed by RAID Admin 1.3.3 or later, and the accompanying firmware. The latest version of RAID Admin can be downloaded as a disk image, a tar file or a zip file from the Downloads area of the Apple Support site. Apple recommends that customers run the latest version of RAID Admin and the accompanying firmware with their Xserve RAID.

iMovie may not import protected AAC content correctly

This article has been archived and is no longer updated by Apple.
If you purchase a song from the iTunes Store and want to use it in iMovie, you may find that the song previews fine in the iMovie Audio pane, but does not play once you drag the file to the timeline. If you run into this issue, read on for some things to check. After doing each step, test your iMovie project to see if the song plays.

1. Make sure that iTunes, iMovie, and QuickTime are up to date.
2. Quit iMovie and make sure the audio track you are trying to import plays correctly in iTunes. If it does, try reimporting the track into your iMovie project again.
3. If you installed third-party QuickTime plug-ins, try disabling them (click here for instructions on how to disable QuickTime plug-ins).
4. If you installed third-party iMovie plug-ins, try disabling them (find steps to remove iMovie plug-ins here).
5. Try recreating the iTunes Music Library.xml file as described here.

Logic Pro 7: Waveform overviews are always created in the background

This article has been archived and is no longer updated by Apple.
In Logic 7, waveform overviews are always created as a background process. In earlier versions, this process could be sped up by double-clicking the overview calculation Progress window. Although page 356 in the Logic Pro Reference Manual indicates that you can double-click the Progress window and then click Finish to move the process into the foreground, this is not the case in Logic Pro 7.0.

However, this ability returns in Logic Pro 7.1. The overview creation progress dialog now has a check box labeled "Faster overview creation (may affect Logic's performance)." Checking this box will bring the overview creation process to the foreground, significantly speeding it up. If you are performing other operations in Logic while doing this, those operations may be affected, as they will have a lower priority than the creation of the overview.

Using Emulex switches with Apple Fibre Cards and Fibre-attached storage

This article has been archived and is no longer updated by Apple.

When using Emulex fibre switches in a Storage Area Network (SAN) topology such as an Xsan deployment, or in a Network Area Storage (NAS) deployment, you may need to modify the port settings to ensure constant communication between devices on the fibre network.

The Smart Settings for each port on Emulex 355 and 375 fiber switches reflect the role that the machine attached to the port will provide in the fabric topology. The Smart Setting varies according to whether the port will connect to a host or a storage device.

For ports that will be connected to a host computer, such as an Xserve or a Power Mac G5, the port's Smart Setting should be set to "Initiator with Stealth." This setting prevents host devices from receiving Loop Initialization Primitive Sequence (LIPs) messages from other Initiators. See Using Fibre Channel switches and hubs with Apple Fibre products for more information about LIPs.

1. Using Mozilla on a computer running Mac OS X, connect to the Emulex Switch and click the Login button.
2. Authenticate with the administrator password when prompted. (The default password is “password”.)
3. From the **Port** menu, choose **Smart Settings**.
4. Select "Initiator with Stealth“ from the list of Smart Settings sets, then click the Clone button.
5. Name the new Smart Settings set. (Do not use spaces in the name.)
6. Select the new set from the list of Smart Settings sets. Check each port number that will be connected to a host machine.
7. Click Change Notifications to expand the view.
8. Change the ”Stealth Intelligent Change Manager“ setting to ”Initiator: Only Receive Changes“.
9. Click the Submit button.

For ports that will be connected to a storage device, the Smart Setting should be set to "Target with Stealth." This setting allows storage devices to inform hosts that it has entered the network.

1. Using Mozilla on a Mac OS X-based computer, connect to the Emulex Switch and click the Login button.
2. Authenticate with the administrator password when prompted. (The default password is “password”.)
3. Choose **Port > Smart Settings**.
4. Select "Target with Stealth" from the list of Smart Settings sets, and click the Clone button.
5. Name the new Smart Settings set. (Do not use spaces in the name.)
6. Select the new set from the list of Smart Settings sets. Check each port number that will be connected to a storage device.
7. Click Change Notifications to expand the view.
8. Change the "Stealth Intelligent Change Manager" setting to "Target: Only Send Changes".
9. Click the Submit button.

Learn how to configure Emulex Switches in a cascade topology here. For instructions regarding how to change Smart Settings, please reference the Emulex product manual that is specific to your switch model. You can download Emulex switch manuals here.

Tip: Pre-configured switch configuration files can be downloaded from Emulex' website.

Can‘t receive all of a multiple-page fax in Mac OS X 10.3

This article has been archived and is no longer updated by Apple.

If your computer is set to receive faxes, but only receives the first few pages of a multiple-page fax, update to Mac OS X 10.3.9 or later.

This could happen with Mac OS X 10.3 through 10.3.8 and a Mac that has a "Jump" modem (included with Macs introduced after March 2004).

Solution

Download and install the Mac OS X 10.3.9 Update.

QLogic Storage Area Network (SAN): Apple interoperability testing and supported firmware

This article has been archived and is no longer updated by Apple.
Apple and QLogic have developed a joint, comprehensive test process to ensure interoperability within the Apple SAN environment. The test focuses on each component within the SAN, including application software, server, Host Bus Adapters (HBAs), RAID storage, and fibre channel switches. In addition to individual device testing, Apple performs end-to-end solution testing within real-world environments to ensure that all devices within the SAN are interoperable.

To ensure robust interoperability, you should use the tested versions of firmware for each of the SAN components. QLogic now has an Apple-specific website that provides users with firmware that has undergone this comprehensive testing process. All fibre channel switches that are deployed within the Apple environment should be updated with the Apple tested and supported switch firmware and management GUI. You can get SANbox switch firmware and management GUI for the SANbox 5200 and SANbox2-64 here:

http://support.qlogic.com/support/drivers_software.aspx

This website will be updated as new switch firmware and management GUIs become available. If you have any questions regarding the update process of QLogic SANbox switches, please contact QLogic technical support at:

Website: http://solutions.qlogic.com/KanisaSupportSite/supportcentral/supportcentral.do
Phone: +1 952-932-4040
Email: support@qlogic.com

Note: QLogic Fibre Channel Switches obtained from the Apple Store will be updated to the latest tested and supported firmware, and will include a software CD that contains the latest supported management GUI. SANbox switches obtained outside of the Apple Store may have different versions of firmware and should be updated to the latest Apple-supported firmware available at the URL listed above.

iPod shuffle: Turn on disk mode before transferring files

This article has been archived and is no longer updated by Apple.

When using iPod shuffle to transfer files, turn on disk mode first. If you don't, it will appear as if you have to make the target computer (the one that you're transferring files to) the owner of iPod shuffle; doing so will erase the contents on the iPod shuffle.

Published Date: Oct 7, 2016

iPod shuffle: Issues with song quality

This article has been archived and is no longer updated by Apple.

If you think songs on your iPod shuffle could sound better, it could be a result of transcoding. Transcoding will convert higher bitrate (160 or 192 kbps) MP3 files to 128 kbps AAC files if the preference is set this way.

To prevent this, go into the iPod preferences and turn off the "Convert higher bitrate songs to 128 kbps AAC for this iPod" option. Another way to ensure good quality is to rip the songs from the original CD directly to 128 kbps AAC files.

This option was designed primarily for larger AIFF or Apple Lossless Encoder files.

iChat displays "Internal Error" when starting a chat with the Helvetica font turned off

This article has been archived and is no longer updated by Apple.

If you turn off (disable) the Helvetica font (the Apple-created one) on your computer, you won't be able to start an iChat chat. Instead, you'll see some gibberish message, like this:

> iChat Internal Error! NSInvalidArgumentException: NSConcreteMutableAttributedString addAttribute: value: range:: nil value

What's up with that?

iChat needs the "Helvetica" font included with Mac OS X to start a chat (you may have other "Helvetica"-type fonts installed with similar names). It's easy to turn the font back on if you used Font Book to turn it off. If you disabled the font using another third-party font management application, use that software to turn it back on, or disable the software.

This document applies to Mac OS X 10.3.9 and earlier.

Mac OS X: SMB links (URLs) not recognized as web content

This article has been archived and is no longer updated by Apple.
Mac OS X web-savvy applications, such as Mail and Safari, do not recognize SMB links as web content. However, you can easily connect to SMB servers by pasting a link into the Connect to Server dialog ("SMB" is the name of the Microsoft Windows file sharing protocol).

You probably won't come across this issue, because servers rarely use SMB to distribute web content on the open Internet. However, sometimes a school or other organization might store media files on a Windows server for local access (LAN/WAN), and then give out links that look like this:

```
smb://servername/example_movie.mov
```

If you are the administrator of such a LAN/WAN configuration, consider serving content via both SMB and HTTP services. When you intend the content for web-savvy Macintosh applications, provide an HTTP link.

iPod shuffle and Motorola phones featuring iTunes: What's that gray dot in iTunes?

This article has been archived and is no longer updated by Apple.

This article does not cover iPhone support in iTunes. For more information about iPhone support in iTunes, click here.

If you see a song in iTunes with a gray dot next to it, it means the song has not been synced yet to the iPod shuffle or Motorola phone featuring iTunes. Once you sync the song, the dot will go away.

While the song is being synced, the dot will change into two rotating arrows.

The gray dot may remain next to the song if it could not be sent to the iPod shuffle or Motorola phone featuring iTunes. Check here for possible reasons the song might not have synced.

iPod shuffle: Renaming in the Mac OS X Finder

This article has been archived and is no longer updated by Apple.

If you use Mac OS X 10.2.8, you won't be able to rename your iPod shuffle in the Finder. The iPod shuffle drive is formatted using the File Allocation Table (FAT) format. Mac OS X 10.2.8 does not support the renaming of FAT formatted volumes.

If you rename iPod shuffle in iTunes, the name will not change in the Finder.

You can rename your iPod shuffle so the Finder displays the new name if you have access to a Mac with 10.3.4 or later and built-in USB or a Windows-compatible PC that works with iPod shuffle. Check here for system requirements. The renamed iPod shuffle will then work fine with your computer using Mac OS X 10.2.8.

When renaming any FAT-formatted volume (including iPod shuffle) in the Finder, you can't use double-byte characters (including Chinese, Japanese, and Korean). If you try, you'll see this error:

Use only Roman characters to rename the iPod in the Finder. You can use double-byte characters to rename the iPod shuffle in iTunes.

Apple Remote Desktop: How to send Ctrl-Alt-Del to a PC

This article has been archived and is no longer updated by Apple.

If you use Remote Desktop to administer a PC that's running VNC, you may be wondering how to send the Ctrl-Alt-Del command (Control-Alternate-Delete) from a Mac to the PC. Though Mac and PC key mapping differs, you can use an alternate key combination in Remote Desktop 2.0 and later to send the command.

For full-size (desktop) keyboards, use **Control-Option-Forward Delete**.

Note: The Forward Delete key is located below the Help key on a full-size keyboard. Be sure not to confuse it with the Delete key located above the Return key.

For abbreviated keyboards (on portable computers), use **Function-Control-Option-Command-Delete**.

Apple Remote Desktop 2: How to copy a computer list from one admin to another

This article has been archived and is no longer updated by Apple.
Here's how to copy a computer list from one administrator to another in Apple Remote Desktop 2.0 or later (for 1.2, look here).

To transfer the list, follow these steps:

1. Select the computer list.
2. Select all the computers in the list.
3. Copy the list and paste it into a text editor such as TextEdit.
4. Save the new document and then copy it to the other admin system.
5. Select the Scanner in Remote Desktop.
6. Change the pop-up menu from **local network** to **File Import**.
7. Use the ellipsis (...) button to select the newly-copied list.
8. Create a new computer list based on the computers found by the scanner.

Logic Pro 7: EXS Instrument edits stay active until quitting

This article has been archived and is no longer updated by Apple.
If you make changes to a sampler instrument in the EXS24 Sampler Instrument Editor, the edits stay active until you quit and restart Logic Pro.

When you close the EXS24 Sampler Instrument Editor, a dialog appears, asking if you want the instrument changes to be stored. Even if you choose not to save the changes, the sampler will still play the edited version until you quit and restart Logic Pro.

When you do quit Logic Pro, you will be asked again if you want to save the changes to the instrument. If you want to discard the changes, click Don't Save in the dialog.

If you don't want to restart Logic Pro
You can temporarily save the edited instrument using a different name and then load the original instrument.

1. Save the edited instrument using a different name. In this case, it would preferable to save the instrument to the Desktop so it could be moved to the Trash easily.
2. Load the original instrument. It will load without the edits and playback as expected.

iPod photo: iTunes quits unexpectedly when optimizing photos

This article has been archived and is no longer updated by Apple.
Some photos with very unusual dimensions (for example, a photo that is really wide but only a few pixels high) can cause iTunes to quit unexpectedly when you try to sync them to your iPod photo. This occurs during the photo-optimizing phase—when "Optimizing photos for *iPod name*" is showing in the status section of the iTunes window. This is more common with graphics imported from websites.

First, make sure you have iTunes 4.7.1 or later. If you have an earlier version of iTunes, update to the latest version and try syncing again. If the issue remains, then continue with the steps below.
To check the version of iTunes:
Macintosh: From the **iTunes** menu, choose **About iTunes**.
Windows: From the **Help** menu, choose **About iTunes**.

If you are aware of any problematic photos within the folder or Library being synced, try removing them and try the sync again. If you're not sure if you have such photos, try syncing smaller subsets of photos until you identify the photo that is causing iTunes to quit.

Logic Pro 7: How to export songs for earlier versions of Logic

This article has been archived and is no longer updated by Apple.

Any song[1] that you create in Logic Pro 7 can be opened in Logic Pro 6.4.3 but not in earlier versions. However, you can export songs that will be compatible with versions as early as Logic 4.8 if you have Logic Pro 6.4.3.

To do this, open a song in Logic Pro 6.4.3 and save it from there to use in Logic 6. Logic Pro 6.4.3 also allows you to export a song in Logic 4.8 format for use in Logic 5 and Logic 4.8:
Choose **File** > **Export** > **Song as Logic 4.8 song**

Although the Logic Pro 7 Reference Manual states that the option to export to a earlier versions still exists, it has been removed from Logic Pro 7 due to a significant change in the song format.

Please note that when you export songs to an earlier version of Logic, all functions that are not available in the earlier version will be lost.

Notes

1. Songs created in Logic 7.2 or later can only be opened in Logic 7.0 or later. Additionally, songs created in Logic 7.2 or later on an Intel system can only be opened in Logic 7.0-7.1.x if first opened in Logic 7.2 or later on a PPC system and then saved.

Using the QuickTime MPEG-2 Playback Component with VOB files

This article has been archived and is no longer updated by Apple.

If you have the optional QuickTime MPEG-2 Playback Component installed with QuickTime 6 or later, you can play back video in Video Object (VOB files), which are used in the DVD-Video specification and contain the mutiplexed audio and MPEG-2 video data.

Sometimes QuickTime Player needs a little help to recognize VOB files when opening them from the Finder. If a VOB file doesn't open by simply double-clicking it, do these steps:

1. Select the VOB file (.vob) in the Finder.
2. From the **File** menu, choose **Get Info**.
3. From the **Open With** pop-up menu in the Info window, choose **Other**. A Choose Other Application window appears.
4. From the **Enable** pop-up menu, choose **All Applications**.
5. Navigate to the Applications folder and select QuickTime Player.
6. Click Add. If you see this alert...

   > You don't have privileges to change the application for this document only. Do you want to change all similar documents to open with the application "QuickTime Player?"

   ... then click Continue.

This should set Mac OS X to open VOB files in QuickTime Player whenever you double-click them in the Finder. The MPEG-2 Playback Component may ignore the audio portion of the stream, but the video will play back normally. Please note that the component will not play back encrypted VOB files, such as those found on commercially-produced DVDs, in QuickTime Player.

Xsan: Settings for configurations with multiple storage pools

This article has been archived and is no longer updated by Apple.
If you're running Xsan 1.0 or 1.1 with any fibre channel storage, only the first two storage pools may contain metadata. The third or later storage pools should be set to User Data Only.

If the third or later storage pool is configured for any setting other than User Data Only, your controllers may fail over. If this is the case, follow these steps to resolve the issue:

1. Unmount the Xsan volume from all clients.
2. Stop the Xsan volume.
3. Set all storage pools (except for the first two) to be used for User Data Only.

   Warning: Changing a storage pool's use will cause the volume to be reinitialized, erasing all data on the volume.

4. Click Save.
5. Restart the Xsan volume.

iPod shuffle may not fit in all USB ports

This article has been archived and is no longer updated by Apple.

This document is for the original iPod shuffle

The iPod shuffle (Second Generation) comes with a required dock and cable.

Because of iPod shuffle's width, you may not be able to connect it to certain USB ports on your computer. If that's the case, you can use the iPod shuffle Dock or a third-party USB extension cable to make the connection. These items are available at the Apple Store under iPod Accessories.

This issue could occur with any computer, display, or USB hub with recessed or closely spaced USB ports. This includes the following Apple products:

- eMac
- iMac G3
- the original iBook and iBook (FireWire)
- Apple Studio Display 17 (ADC)
- Power Mac G4 (Digital Audio)
- Power Mac G4 (Quicksilver)
- Certain Xserve configurations.

Note: If your Mac came with a USB Keyboard Extender cable, don't try to use it with iPod shuffle. This cable is keyed to only fit the keyboard that came with your computer.

Unexpected behavior with iPod shuffle or iPod nano if connected during computer startup

This article has been archived and is no longer updated by Apple.

If you leave your iPod shuffle or iPod nano connected to your computer when you restart or start up a Windows-compatible PC, you might encounter up to a 3-minute delay on startup. You can either wait it out (if you don't mind waiting), or disconnect your iPod shuffle or iPod nano and wait until the computer has started before reconnecting it.

For more information on this situation and how to permanently avoid it, read this article.

On certain older Power Macintosh G4 desktop computers, your computer may boot into Open Firmware if your iPod nano is connected on startup. To avoid this, use a hub to connect iPod nano to your computer, or wait until your computer has started up before connecting your iPod nano.

My AirPort connection does not work

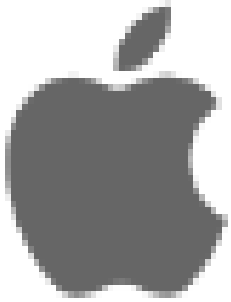
This article has been archived and is no longer updated by Apple.

If your computer can't connect to the Internet over AirPort, try the following steps to resolve the issue.

Check AirPort card status

1. From the **Apple** menu, choose **About This Mac**.

2. In the resulting window, click More Info to open System Profiler.



3. In the System Profile window, select AirPort Card from the left column under Hardware.

4. If the panel to the right displays "No information found," your computer doesn't realize that it has an AirPort Card installed. Try removing and reinstalling your AirPort Card in your computer and then check again.
   If you want to see instructions on how to reseat the card, click here.
5. If your computer recognizes its Airport Card but you still can't connect to your network, try the steps in the Airport Troubleshooting Guide.
6. If your computer still doesn't recognize the AirPort Card even after you've reseated it and checked its connection, your card may need to be replaced. You can order a replacement AirPort Card online.

When I type, unfamiliar characters appear on the screen

This article has been archived and is no longer updated by Apple.

If unfamiliar characters appear on your screen when you type in Mac OS X, these steps can help you troubleshoot the issue.

It's possible to accidentally change your keyboard's language or layout—for example, from English to Japanese. This can result in mixed-up language when you type, like this:

1. To switch back to the U.S. keyboard, from the **Apple** menu, choose **System Preferences**.

2. Click the International icon to open its preferences.

3. Click the Input Menu tab near the top of the screen.

4. Scroll down the list and click any checked non-US keyboard layout checkboxes to deselect them.

5. Close System Preferences and try typing a few characters. You can easily do this by creating a new folder in the Finder, clicking on the folder name, and renaming it. Do you still get strange characters when you type? If you do, check to make sure that you have carefully followed the instructions above.

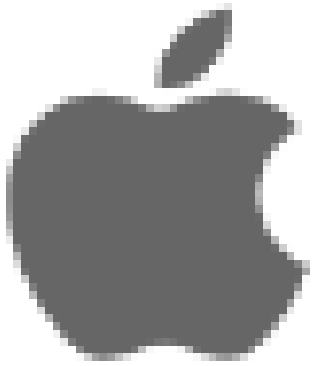
The USB port on my keyboard doesn‘t work

This article has been archived and is no longer updated by Apple.
If one of your Apple keyboard's USB ports don't seem to be working, these steps can help you troubleshoot the issue. Check the USB Basic Troubleshooting steps first and if these don't resolve the issue, move on to the step-by-step instructions.

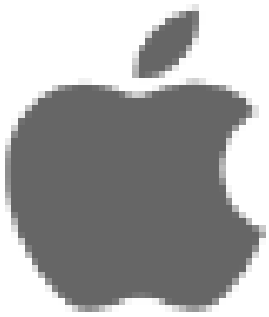
Troubleshooting your Apple USB Keyboard Step-by-Step

If your keyboard USB port still isn't working after trying the steps in article 58033, try these steps, in order, until you've come to a resolution.

1. Unplug and replug the keyboard from the back of the computer. Make sure the USB port and plug are firmly connected.
2. Take the device that isn't working when attached to the keyboard, and plug it in to the other USB port of the keyboard. Test to see if it works there. If it does, unplug and replug the keyboard from the computer. Test both ports again. If the device consistently works in one USB port on the keyboard but not the other, skip step 2 and move on to step 3.
3. Take the device that isn't working when attached to the keyboard, and plug it in to the USB port directly on the computer. Test to see if it works there. If the device works when attached to the computer, but doesn't work when it's attached to the keyboard, it probably needs a powered USB hub to function.
4. Restart your computer and hold down the Option key on your keyboard while it starts up.



5. You should see a blue screen, called the Startup Manager, that displays two arrow buttons and your hard drive.



6. Test your mouse in the questionable keyboard USB port at this screen. It may be jumpy, but the mouse should work. Test the other port as well, for comparison. If your mouse doesn't work in just one keyboard port while in the Startup Manager and you've followed all the other troubleshooting steps, you will probably need to replace your keyboard. You can order the keyboard online. Order a replacement keyboard.
7. If your mouse works in the questionable port while in the Startup Manager but not after you start up your computer normally, software seems to be the cause of the issue. Follow these steps to fix the issue.
    1. Insert the Software Install and Restore disc into your CD/DVD drive.

2. Shut down your computer.
3. Once it's off, hold down the C key on the keyboard and start up your computer. (You can let go of the C key when you see the big Apple logo on the screen.) This will start up the computer from the Software Install and Restore disc instead of your hard drive.
4. Now you want to use the Archive and Install feature of the Mac OS X installer. This kind of installation gives you a fresh version of Mac OS X, but you don't lose any data from the computer as your old information is all archived.

AirPort Setup Assistant 4.1 quits unexpectedly when administering AirPort Extreme

This article has been archived and is no longer updated by Apple.
When trying to configure an AirPort Extreme Base Station with AirPort 4.1 software, the AirPort Setup Assistant may unexpectedly quit. This may occur if your AirPort Extreme Base Station is using the default wireless network name and version 5.4 or earlier firmware.

To resolve the issue, update your AirPort Extreme firmware to version 5.5 or later, using the update found here. If you are unable to connect to the base station to update the firmware, perform a hard reset.

If that doesn't work, try disconnecting the base station from power, plugging it back in, and then using the "AirPort Setup Assistant for Graphite and Snow" utility, which is located in your Utilities folder next to the default version of AirPort Setup Assistant.

This document will be updated as more information becomes available.

Modem: Not Answering Calls

My modem will not answer incoming calls. I have verified that I can call out, performed a clean software install and otherwise verified that my software settings are correct. Is hardware service the only option at this point?
This article has been archived and is no longer updated by Apple.
There is at least one other factor that should be checked first.

Telephone companies define a "ringer equivalency number" for each device that rings when your telephone number is called. This number represents the current each device draws. The maximum number of RENs per circuit is going to be a number less than 4.0 or 5.0. The exact number is set by the capabilities of your local phone carrier.

As more devices are connected to the phone line the total REN value increases. When the total REN value starts to approach the maximum value set by the phone company, strange things can start to happen. One of them is that when you receive an inbound call, the modem may not detect there is a call at all. It therefore does not go "off-hook," and you do not receive the call.

The modems included with Apple computers usually have an REN of between 0.7 to 0.9. Third-party modems have similar values. Some typical values are:

- iMac internal modem: 0.3
- Global Village Bronze: 0.7 (used on most Performas prior to 1995)
- Global Village Gold II for Performa: 0.8 (used on the Performa 6100 and some 630 series machines)
- Global Village Gold IIv (used in the Performa 6200 and 5300 series): 0.80
- Global Village Platinum V (used in the Performa 6300, 6320, 6290, and some 6400 series): 0.88
- GeoPort Telecom Adapter: 0.7 (stand-alone kit; also included with some Performa 6116s)
- GeoPort Telecom Adapter II: 0.5 (stand-alone kit)

The exact number can vary throughout the manufacturing life of a product, by usually not by more than 0.1. The number for your particular device is usually going to appear on the modem's FCC ID plate. In the case of internal modems, it will be on a placard on the modem card itself (usually not visible from the outside).

Telephones can have values of between 0.7 to 3.5. The exact REN is usually going to be stamped on the bottom of the telephone base, right in the plastic, or on an FCC ID plate, if one is present.

To test whether your modem is not answering because of too many telephones, fax machines, or modems attached to your phone number, proceed as follows:

1. Disconnect ALL additional phones. It is not sufficient to simply turn the ringer off. Remove them from their wall sockets.
2. Plug in one phone into the telephone wire servicing your computer. Verify that you get a dialtone.
3. Configure your fax software correctly. The details will vary depending on what computer you have.
4. Attempt to receive an inbound call.

If you receive a call successfully, go back and determine the RENs of each device (including the modem) you have attached to your phone number. If the value is above or near 4, call the phone company and see what their maximum total REN value for your central office is.

The phone company may have additional suggestions or recommendations on how you can overcome this problem, but odds are, you may need to invest in another phone line.

For more information on the Ringer Equivalency Number for the iMac internal modem, please see the following Knowledge Base article:

24643: "iMac: Ringer Equivalency Number (REN) For Internal Modem"

iPod shuffle: Certain characters in file names can affect transferring files to and from the Mac

This article has been archived and is no longer updated by Apple.
iPod shuffle is an iPod that is formatted as FAT32, regardless of whether you are using it on a Mac or Windows computer. Because of this, files that have the following characters in their names are not allowed:

```
* . " / \ [ ] : ; | = ,
```

This also affects any characters you type using the Option or Control keys (like a bullet - Option-8). Note that the period before the three character extension (.mp3, .aac, .jpg) is not considered as part of the file name in this case. This doesn't affect audio files you copy inside of iTunes.

If you copy a file that contains such a character in its name to iPod shuffle from a Mac, you will see a message that says one or more files could not be copied. If you ignore this message and then transfer the files from iPod shuffle to another computer, the filenames may not appear as they did on the original computer.

Does this mean you have to rename every file that contains these special characters you want to copy to iPod shuffle? Not at all. Just follow these steps to create an archive file that acts as an envelope for your other files, allowing you to keep your original file names intact. If you already tried copying the files separately, remove them from iPod shuffle first.

Mac OS X 10.3 or later

1. In the Finder, select the files you want to transfer.
2. From the **File** menu, choose **Create Archive**.
3. Name the archive without using any special characters.
4. Copy the archive file to iPod shuffle.

If you're not running Mac OS X 10.3, you can use an archive program such as Stuffit or Zip to create an archive, or rename your files without using any special characters.

iCal doesn‘t update if some third-party utilities are installed

This article has been archived and is no longer updated by Apple.

Some third-party iCal-related utilities, such as Objectpark Software MenuCalendarClock, may prevent you from installing iCal updates that you get from Software Update or download from the Apple site. (“Third-party” refers to products created by companies other than Apple.) When you attempt to update iCal, you receive a message that says that you cannot update iCal because it is “running.” Even if you quit iCal, the issue persists.

What can you do? Check to see if you have a third-party application or utility running that might be accessing iCal resources. Quit or stop the software, then update iCal.

You might also want to contact the developer of the application for possible updates to their software that could avoid this issue.

Logic Pro 7: Burned CD only plays noise

This article has been archived and is no longer updated by Apple.

Symptom

When set the Bounce destination to Burn, the resulting CD contains only noise.

This only happens under the following settings in the Bounce dialog window:

- You select PCM in addition to Burn.
- The file format for PCM is set to Wave.

Solution

As a workaround, either change the file format for PCM from Wave to AIFF, or deselect PCM and only use Burn.

This document will be updated as more information becomes available.

Logic Pro 7: "Assignment" not available in Guitar tab

This article has been archived and is no longer updated by Apple.
According to the manual, the Guitar tab under the Song Settings should have four options for the Assign parameter:

- Pitch
- Channel
- Inv.Channel
- Inv.Channel-1, Inv.Channel-2

If you don't see these options, then update to Logic Pro 7.0.1 or later to see them.

About the Mac OS X 10.3.8 Update (Delta)

This article has been archived and is no longer updated by Apple.
This software updates Mac OS X 10.3.7 to version 10.3.8. If you have version 10.3, 10.3.1, 10.3.2, 10.3.3, 10.3.4, 10.3.5, or 10.3.6, update your software with the Combo Update instead.

Important: Please read before installing

- You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. (This does not apply to normal application software installation.)
- The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to update.

Installation

You have two ways to update to Mac OS X 10.3.8: Use Software Update or the standalone installer. Use just one of these methods to update your computer.

Automatic Software Update

Software Update, located in System Preferences, can automatically download and install the latest Apple software. Software Update may have linked you to this document for additional information about the update.

This update's size may vary from computer to computer when installed via Software Update.

Because some updates are prerequisites for others, you may need to run Software Update more than once to get all available updates.

Standalone installer

Two versions of the installer (Delta and Combo, described below) are available from Apple Downloads as standalone updates. After you download an update, you can use it without being connected to the Internet.

- The Delta Update installer (described here) will update Mac OS X 10.3.7 to 10.3.8.
- The Combo Update installer can update 10.3, 10.3.1, 10.3.2, 10.3.3, 10.3.4, 10.3.5, 10.3.6, or 10.3.7 to 10.3.8.

The standalone installer, particularly the Combo Update, is useful if you have multiple computers to update and only want to download the 10.3.8 update once.

Mac OS X 10.3.8 Enhancements

These are some of the enhancements delivered with the Mac OS X 10.3.8 Update:

- Addresses an issue with Mac OS X 10.3.7 in which iChat, Mail, or other network-based applications could take a long time to open.
- Addresses an issue in which a computer wouldn't always restart automatically after a power failure, even when the Energy Saver preference option "Restart automatically after a power failure" was selected.
- Improves the performance of Blizzard World of Warcraft's "Full Screen Glow" video feature.
- Improves DVD Player compatibility when playing a movie (using certain ATI Radeon cards) to an external widescreen TV with a 16:9 aspect ratio.
- Resolves an issue in which a "flicker" could be seen when navigating DVD menus in DVD Player on certain PowerBook G4 computers.
- Addresses an issue in which a PowerBook G4 computer would, on rare occasion, wake from sleep with a black screen and not respond to any keyboard, mouse, or trackpad input.
- Addresses "jumping cursor" issues that might occur when using your portable computer's trackpad with your thumb, side of thumb, or a "flat" finger.
- Resolves an issue on certain Power Mac G5 computers where a fan cycles erratically at unexpected times, such as when Seti@home software is running.
- Speeds up Address Book and Mail LDAP lookups that are performed by a Cisco DistributedDirector DNS server.
- Addresses an issue that could prevent clients using the Active Directory plugin from binding to their Active Directory server.
- Addresses a kernel panic that could occur when dialing or connecting to your ISP via your internal Apple modem.

About the Mac OS X 10.3.8 Update (Combo)

This article has been archived and is no longer updated by Apple.
This software updates Mac OS X 10.3, 10.3.1, 10.3.2, 10.3.3, 10.3.4, 10.3.5, 10.3.6, or 10.3.7 to version 10.3.8. If you have version 10.3.7, you can update your software with the smaller delta update instead.

Important: Please read before installing

- If you have a third-party FireWire hard drive connected, disconnect it before installing this update. Reconnect it and turn it back on after installation is complete and you've restarted.
- You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. (This does not apply to normal application software installation.)
- The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to update.

Installation

You have two ways to update to Mac OS X 10.3.8: Use Software Update or the standalone installer. Use just one of these methods to update your computer.

Automatic Software Update

Software Update, located in System Preferences, can automatically download and install the latest Apple software. Software Update may have linked you to this document for additional information about the update.

This update's size may vary from computer to computer when installed via Software Update.

Because some updates are prerequisites for others, you may need to run Software Update more than once to get all available updates.

Standalone installer

Two versions (combo and delta, described below) of the installer are available from Apple Downloads as standalone updates. After you download an update, you can use it without being connected to the Internet.

- The "combo" installer (described in this document) can update 10.3, 10.3.1, 10.3.2, 10.3.3, 10.3.4, 10.3.5, 10.3.6, or 10.3.7 to 10.3.8.
- The "delta" installer will update Mac OS X 10.3.7 to 10.3.8 (described in a different document).

The standalone installer, particularly the combo, is useful if you have multiple computers to update and only want to download the update once.

Enhancements

What does this update include? Check out the Enhancements section of this document for details.

This update also includes enhancements delivered with:

Mac OS X 10.3.7 Update
Mac OS X 10.3.6 Update
Mac OS X 10.3.5 Update
Mac OS X 10.3.4 Update
Mac OS X 10.3.3 Update
Mac OS X 10.3.2 Update
Mac OS X 10.3.1 Update

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X: Mail displays a "Too many recipients" alert and won‘t send the message

This article has been archived and is no longer updated by Apple.
Does Mail complain when you try to send a message to several recipients at once? You might be surprised to know that Mail actually has *no limit* on the number of recipients to whom you can send a message! So, what's going on here?

Chances are it's your Internet Service Provider (ISP) that's preventing your message from being sent. Your ISP might do this, for example, to deter folks who send unsolicited bulk commercial email (such as "spam" or "Junk mail") to a large number of addresses.

If this happens to you, contact your ISP and ask them if they enforce a limit on how many recipients each email message can have. If there is a limit, you can either send your message to fewer people, or divide your recipient list into multiple sets and send the same message in batches (each time to a different set of recipients).

How to position your Mac mini

This article has been archived and is no longer updated by Apple.

You can place your Mac mini on its side and use it if you like. Just be sure not to rest the computer on its front or back side or you'll block access to the slot-loading optical drive in front or port connectors in back.

Always place your Mac mini on a hard, flat surface to provide maximum airflow to the computer's vents around the rubber base. Don't put anything on top of your Mac mini or stack Mac minis on top of each other either. If your Mac mini is configured with AirPort or Bluetooth, you could hamper the signal strength since the antennas are located in the top of the computer.

Shake 3.5: FileIn node thumbnail images are not displayed

This article has been archived and is no longer updated by Apple.

Depending on a user's file access permissions, FileIn node thumbnail images may not display in Shake if writing a file to the cache directory is prohibited.

Symptom
Shake does not display the source material image thumbnails of FileIn nodes in the NodeView window.

Solution
Create a definition file for configuring your environment and specify a folder to which the disk cache should be written. You can create a definition file using a plain text editor such as TextEdit. Here's an example of how to create a definition file:

1. Open TextEdit.
2. In a new document, type the following configuration line:
   ```
   diskCache.cacheLocation="/Users//Library/Caches/Shake";
   ```
3. Save the file with the name `cache.h`.
4. Place cache.h in the following folder:
   /Users/user_name/nreal/include/startup/ui/
   This will specify the folder to which the disk cache will be written.

Mac mini: What keyboard and mouse to use

This article has been archived and is no longer updated by Apple.

The Mac mini does not come with a keyboard or mouse. If you don't already have a keyboard or mouse, you can buy one that connects via USB or Bluetooth.

USB

The Mac mini has two USB 2.0 ports, which can be used with any USB 1.1- or USB 2.0-compliant keyboard and mouse.

The Apple USB Keyboard and Apple Pro Keyboard both contain a USB hub that allows you to connect a USB mouse and still have two free USB ports (one on the keyboard and one on the back of the Mac mini) for other USB devices. If you have a USB device that doesn't have its own power supply, you may want to connect it directly to the USB port on the computer rather than to the USB port on the keyboard.

Note: Some third-party USB keyboards may have different keys than an Apple keyboard.

Bluetooth

You can also order a Mac mini with an internal Bluetooth module that allows you to use an Apple Wireless Keyboard, Apple Wireless Mouse, and many other Bluetooth accessories. If you have a Mac mini without Bluetooth installed, you can purchase an internal module and have it installed, or you can use a USB Bluetooth adapter to enjoy wireless connectivity with Bluetooth-compliant devices.

WebObjects 5.2.x: How to Rename a Project with Xcode in Mac OS X 10.3 or later

This article has been archived and is no longer updated by Apple.
When renaming a WebObjects or Cocoa project using the Rename command from the Project menu in Xcode, the resulting executable file may retain the original name of the project. This is because, with Xcode in Mac OS X 10.3 or later, the name must be changed in other places in addition to choosing Rename from the Project or File menu.

Assume you are starting with a project named "MyWOProject" and that you want to change its name to "MyNewWOProject".

Note that projects originally created with ProjectBuilder will include a project file with the suffix .pbproj. Xcode will not change that suffix to .xcode. Projects originally created with Xcode will include a project file with the .xcode suffix.

Steps for renaming a project

1. Duplicate the "MyWOProject" directory and name it "MyNewWOProject".
2. Rename the MyWOProject.pbproj file inside the MyNewWOProject directory to MyNewWOProject.pbproj. In the case of a project originally created with Xcode, change the name from MyWOProject.xcode to MyNewWOProject.xcode.
3. Open the MyNewWOProject project in Xcode.
4. Rename the MyWOProject target MyNewWOProject.

    a. Click on the disclosure triangle to the left of the Targets Group in Xcode's Groups & Files pane. This reveals the aggregate target named MyWOProject, and the Application Server and Web Server targets.
    b. Click on the aggregate target named MyWOProject in the Groups & Files pane.
    c. Choose Project > Rename. In some versions of Xcode, Rename appears under the File menu.
    d. Replace MyWOProject with MyNewWOProject.

5. Choose Clean All Targets from the Build menu. At this point, if you build the project, the executable still has the name MyWOProject, as does the .woa directory and the URL for connecting to the application. A few more steps are necessary to complete the process.
6. Close the MyNewWOProject project in Xcode or quit Xcode, so that Xcode will not attempt to prevent changes to the project files.
7. Open the MyNewWOProject/MyNewWOProject.pbproj/project.pbxproj file with a text editor. (If the project was originally created with Xcode, it will be located in MyNewWOProject/MyNewWOProject.xcode/project.pbxproj.) This file is not immediately visible in the Finder, so choose from one of the following methods to open the project.pbxproj file:

    GUI Method:

    a. In the Finder, Control-click the MyNewWOProject.pbproj or MyNewWOProject.xcode file, then choose Show Package Contents from the shortcut menu.
    b. Open project.pbxproj in a text editor.

    Command-Line Method:

    a. Open the Terminal.
    b. Use your preferred command-line text editor, such as vi or pico, to open the file.

8. Replace all occurrences of MyWOProject in the project.pbxproj file with MyNewWOProject. This updates PBXBundleReference keys, CFBundleExecutable keys, the NSExecutable key, the .woa directory, several intermediate build directories, PRODUCT_NAME keys, and the application's main jar file.

    Some examples:

    ```
    path = "_WO$(SERVER_UNIQUIFIER)MyWOProject.tmp";
    ```

    Should change to:

    ```
    path = "_WO$(SERVER_UNIQUIFIER)MyNewWOProject.tmp";
    ```

    ```
    path = "_WO$(CLIENT_UNIQUIFIER)MyWOProject.tmp";
    ```

    Should change to:

    ```
    path = "_WO$(CLIENT_UNIQUIFIER)MyNewWOProject.tmp";
    ```

    ```
    PRODUCT_NAME = "_WO$(SERVER_UNIQUIFIER)MyWOProject";
    ```

Should change to:

```
PRODUCT_NAME = "_WO$(SERVER_UNIQUIFIER)MyNewWOProject";
```

```
path = MyWOProject.woa;
```

Should change to:

```
path = MyNewWOProject.woa;
```

```
<string>MyWOProject.jar</string>
```

Should change to:

```
<string>MyNewWOProject.jar</string>
```

Important: Do not modify names of .java files or the .wo directories. Additionally, if you modify any package names in the project.pbxproj file, make sure that you make the appropriate changes to the package statements in your .java source files.

9. Save the changes to project.pbxproj.
10. Open MyNewWOProject in Xcode.
11. Build and run the application. The resulting executable file has the new name of MyNewWOProject, and the URL for accessing the application includes the correctly updated name.

Safari won‘t print after Archive and Install

This article has been archived and is no longer updated by Apple.
A print dialog may not appear in Safari when you try to print, even though other applications still print just fine.

This can happen when you have Safari 1.2.4 (v125.12) on the same computer with Mac OS X 10.3.6 or earlier. This version of Safari comes with the Mac OS X 10.3.7 Update and as such doesn't work properly with the earlier versions of Mac OS X.

To print in Safari, simply update the computer to Mac OS X 10.3.7.

Mac OS X Server 10.3: "postmaster" and other user names can‘t receive email

This article has been archived and is no longer updated by Apple.

Workgroup Manager will allow you to create users named "postmaster," "abuse," and other things that conflict with common server mail aliases. Because of their traditional purposes, users with the following names will not be able to receive email in the default configuration. The server will receive the mail, but the user won't. These names are:

- postmaster
- bin
- named
- uucp
- ftp-bugs
- manager
- dumper
- operator
- abuse
- decode

The file /etc/postfix/aliases defines these names as redirected to root, and root's email is directed to /dev/null. Avoid using these names unless the user will be acting in the traditional role expected of the corresponding address. To allow any of the above user names to receive email, comment out (add "#" before a line) the appropriate line in /etc/postfix/aliases. For example:

```
# Well-known aliases
# manager:        root
# dumper:         root
# operator:       root
# abuse:          postmaster
```

Next, execute these commands in the Terminal:

```
newaliases
postfix reload
```

These commands will reload the alias database and the mail server.

Final Cut Pro HD: Digital Cinema Desktop appears green

This article has been archived and is no longer updated by Apple.

The Digital Cinema Desktop feature in Final Cut Pro HD allows you to use your computer's display for full-screen playback monitoring. Under some circumstances, you may see only a green screen instead of your sequence's video. This can happen if you are using 10-bit uncompressed settings in your Final Cut Pro sequence.

To workaround this issue, you can monitor playback in the Canvas window on your computer display, or monitor playback on an external NTSC or PAL monitor. This issue will not affect the final output to file or tape.

This document will be updated when more information becomes available.

Jam Pack 4 demo songs do not play in GarageBand 1.x

This article has been archived and is no longer updated by Apple.
While you can use Jam Pack 4 Real Instrument Apple Loops in GarageBand 1.x, none of the demo songs that come with the package will play. GarageBand 2.x is required for full functionality of the Jam Pack 4.

If you try to play the demo songs in GarageBand 1.x, one or more of the following alert dialogs may appear:

- Performance Warning
- Warning! This song was created by a newer GarageBand version.
- Core Audio: Plug-in "EXS24" not available.
- An error occurred. Result Code = 5000.

iTunes: Smart Playlist window is too long to fit onscreen

This article has been archived and is no longer updated by Apple.

If you add a lot of criteria to the Smart Playlist window in iTunes (and we mean *a lot*—about 20 items or more, depending on your screen resolution), you can effectively cause the window to extend beyond the bottom of your screen (no scroll bars appear in the window if this happens). If you really want to create a smart playlist with that many conditionals, follow these steps:

1. From the **File** menu, choose **New Smart Playlist**.
2. Add some of the criteria that you want for your Smart Playlist, but don't let the window extend below the bottom of the screen.
3. Click OK.
4. Enter a name for your playlist in the Source list.
5. From the **File** menu, choose **New Smart Playlist**.
6. From the first pop-up menu in the Smart Playlist window, choose **Playlist**.
7. From the second pop-up menu, choose **is**.
8. From the third pop-up menu, choose the playlist you named in step 4.

9. Add the remaining criteria items to complete your Smart Playlist.
10. Click OK.
11. Enter a name for your playlist in the Source list.

This document will be updated when additional information is available.

Xsan: Restart hosts to see new Xserve RAID slices

This article has been archived and is no longer updated by Apple.

When slicing a RAID set that is part of an Xsan storage pool, the new slices do not appear immediately in Disk Utility. To ensure immediate recognition of the new slices (LUNs), you should restart all computers that are an Xsan file system client, metadata controller, or failover metadata controller.

Jam Pack 4 requires Soundtrack 1.x users to index loops manually

This article has been archived and is no longer updated by Apple.
Want to use Jam Pack 4 loops in Soundtrack 1.x? Then know this. Jam Pack 4 installs loops in a location that Soundtrack 1.x doesn't immediately know about. To use Jam Pack 4 loops, you will need to manually index the loops. Click here for information on how to index the loops.

The Jam Pack 4 loops are installed in the following directory:
`/Library/Audio/Apple Loops/Apple/Jam Pack 4 - Symphony Orchestra/`

About Mac OS X Server Update 10.3.8

This article has been archived and is no longer updated by Apple.
This software updates Mac OS X Server version 10.3.7 to version 10.3.8.

Important: Read Before Installing

1. An administrator account password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If your password must be changed, follow these steps: Choose System Preferences from the Apple menu. Choose Accounts from the View menu. Select an Admin account and click Edit User. Type your current password, and press Return. Change the password, and click OK.
2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.
3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install.
4. This update can be installed on non-startup volumes, but that should be done **only** when the current startup volume has already been updated to Mac OS X Server 10.3.8. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are two ways to update to Mac OS X Server 10.3.8: Software Update and Standalone Installer.

Software Update Installation

You may have been referred to this document by Software Update. For more information on this feature, see How to Update Your Software.

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

An installer is also available from Apple Featured Software.

The Mac OS X Server 10.3.8 Update is specifically for updating version 10.3.7. There is also a "Combo Update" installer available, which will update any version 10.3.x to 10.3.8.

Remote Installation

If you need to install the update on a remotely located computer, you can do so using either the Server Admin application or the "softwareupdate" command-line tool. Choose the method that works best for you.

Enhancements

These are some of the enhancements that are part of Mac OS X 10.3.8 Server Update:

- Active Directory Plug-in: Addresses an issue in which some Mac OS X computers would not bind to Active Directory, affecting computers with Mac OS X 10.3.6.
- Password Server: Improved scalability and performance with Password Server and Kerberos in a replicated environment.
- Password Server: Addresses an issue where Password server replicas may not be created properly after migrating your 10.2.8 NetInfo servers to 10.3.X OD master.
- Workgroup Manager: Improved batch editing when assigning admin privileges to users.

Mac OS X Server 10.3.8 also includes the enhancements of the Mac OS X 10.3.8 client update.

Published Date: Oct 7, 2016

About Mac OS X Server Update 10.3.8 (Combo)

This article has been archived and is no longer updated by Apple.
This software updates any version of Mac OS X Server 10.3 to 10.3.7 to Mac OS X Server version 10.3.8. It is a "combo" update that combines enhancements delivered with versions 10.3.1 through 10.3.8. If you already have Mac OS X Server 10.3.7, you may download a smaller update that is not a combo.

Important: Read Before Installing

1. An administrator account password that does not contain spaces or Option-keyed characters is required to install. The password may not be blank. If your password must be changed, then follow these steps: Choose System Preferences from the Apple menu. Choose Accounts from the View menu. Select an Admin account and click Edit User. Type your current password, and press Return. Change the password, and click OK.

2. You may experience unexpected results if you have installed third-party system software modifications, or if you have modified the operating system through other means. This precautionary statement does not apply to the normal installation of application software.

3. The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install.

4. This update can be installed on non-startup volumes, but that should be done **only** when the current startup volume has already been updated to Mac OS X Server 10.3.8. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

5. If you are updating from 10.3.2 or earlier and use a MySQL database, you must back it up prior to upgrade. See the Additional Information for MySQL section, below.

6. If you are updating from 10.3.2 or earlier and have set up a loginhook, a custom serial port configuration, or have edited the "/etc/ttys" file for other reasons, you will need to back it up prior to installation of this update.This is because a 10.3.3 or later update overwrites the file with a new copy when updating from 10.3.2 or earlier. The new file will set the Xserve's serial port to communicate at 56Kbps. If your serial device cannot communicate at this speed, you must edit this file to reduce the speed.

Installation

There are two ways to update to Mac OS X Server 10.3.8: Software Update and Standalone Installer.

Software Update Installation

You may have been referred to this document by Software Update. For more information on this feature, see How to Update Your Software.

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

An installer is also available from Apple Featured Software.

Mac OS X Server Update 10.3.8 (Combo) updates any earlier Mac OS X Server 10.3.x to 10.3.8.

Remote Installation

If you need to install the update on a remotely located computer, you can do so using either the Server Admin application or the "softwareupdate" command-line tool. Choose the method that works best for you.

Enhancements Delivered with this update

Many enhancements are delivered with this update. Because this is a combo update, it includes those delivered with 10.3.8 and earlier 10.3 updates. You can see the individual enhancement lists for 10.3.1, 10.3.2, 10.3.3, 10.3.4, 10.3.5, 10.3.6, 10.3.7, and 10.3.8.

Additional Information for MySQL

Data stored in MySQL databases with the version of MySQL that is pre-installed Mac OS X Server 10.3.2 or earlier must be exported and re-imported in order to be compatible with version of MySQL that is pre-installed on Mac OS X Server 10.3.3 or later, in which a byte-ordering issue is fixed.

As with any upgrade install, you should back up your old data. In this particular upgrade, the following process is recommended to convert the data to the correct byte ordering:

Before the upgrade, use the terminal to export the data from your pre-10.3.3 database:

```
#  mysqldump -p table > backup-file.sql
```

or

```
#  mysqldump  --opt database > backup-file.sql
```

After the upgrade, and after initializing the MySQL database, import the data:

```
#  mysql -p table < backup-file.sql
```

or

```
#  mysql  database < backup-file.sql
```

About the Mac OS X Server 10.3.9 Update

This article has been archived and is no longer updated by Apple.

This software updates Mac OS X Server version 10.3.8 to version 10.3.9.

Important: Please Read Before Installing

- To avoid a potential issue that may cause Java applications and Safari to unexpectedly quit, please review this article.
- A server running as an Open Directory master will be temporarily unavailable as such while the database is updated.
- You must have an administrator account password that does not contain spaces or Option-keyed characters to install this update. The password may not be left blank. If you need to change your password, follow these steps:
  1. From the **Apple** menu, choose **System Preferences**.
  2. Click Accounts to display the preferences.
  3. Select an Admin account and click Edit User.
  4. Type your current password and press Return.
  5. Type a new password and click OK.
- You may experience unexpected results if you've installed third-party system software modifications, or if you have modified the operating system through other means. This doesn't apply to normal software installation.
- The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install.
- This update can be installed on non-startup volumes, but you should only do this if the current startup volume has already been updated to Mac OS X Server 10.3.9. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are two ways to update to Mac OS X Server 10.3.9: Use Software Update or install from a standalone installer.

Software Update Installation

Software Update may have referred you to this document. For more information on this feature, see "How to Update Your Software."

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

A standalone installer is also available from Apple Downloads. The Mac OS X Server 10.3.9 Update is specifically for updating version 10.3.8. There is also a "Combo Update" installer available, which will update any version of 10.3.x to 10.3.9.

Remote Installation

If you need to install the update on a remote computer, you can do so using either the Server Admin application or the "softwareupdate" command-line tool. Choose the method that works best for you.

Enhancements

The following items are some of the enhancements and improvements in Mac OS X 10.3.9 Server Update:

Open Directory (Directory Services)

- Schema enhancements for Tiger compatibility.
- Active Directory Plug-In: Addresses a stability issue found with some configurations when binding to a server via Active Directory.
- Password Server: Addresses an issue in which the slapd server may stop responding to authentication requests.
- Password Server: Addresses an issue in which the slapd server may stop responding during heavy, simultaneous logins from Windows clients.
- Addresses an issue in which clients cannot change the password if bound to a Novell eDirectory server.

Mail Server

- Addresses an issue in which the cyrus database may become corrupted.
- Addresses an issue in which the cyrus server may not respond to configuration changes.

File Services

- AFP: Improved AFP Service reliability and stability when multiple users connect.
- AFP: Improved AFP Server performance and reliability during heavy load.
- SMB: Addresses an issue in which some third-party products (such as Retrospect and Homesite for Windows), connecting to Mac OS X Server 10.3.6 to 10.3.8, may get incorrect volume information, causing the connection to fail.
- SMB and Automounter: Addresses SMB deadlock issues which may have occurred on Servers hosting multiple Automounts.

Network Hardware

- Addresses on issue with Ethernet communication on Xserve hardware that could result in packet corruption.

NetBoot/NetInstall

- Addresses an issue preventing NetBoot and NetInstall images from being hosted on an Xsan volume.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

About the Mac OS X Server 10.3.9 Update (Combo)

This article has been archived and is no longer updated by Apple.

This software updates any version of Mac OS X Server 10.3 to 10.3.8 to Mac OS X Server version 10.3.9. It is a "combo" update that combines enhancements delivered with versions 10.3.1 through 10.3.9. If you already have Mac OS X Server 10.3.8, you can download a smaller update to update to version 10.3.9.

Important: Please Read Before Installing

- To avoid a potential issue that may cause Java applications and Safari to unexpectedly quit, please review this article.
- You must have an administrator account password that doesn't contain spaces or Option-keyed characters to install this update. The password may not be blank. If you need to change your password, follow these steps:
  1. From the **Apple** menu, choose **System Preferences**.
  2. Click Accounts to display the preferences.
  3. Select an Admin account and click Edit User.
  4. Type your current password and press Return.
  5. Type a new password and click OK.
- You may experience unexpected results if you've installed third-party system software modifications, or if you have modified the operating system through other means. This doesn't apply to normal software installation.
- The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install.
- This update can be installed on non-startup volumes, but you should only do this if the current startup volume has already been updated to Mac OS X Server 10.3.9. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.
- If you are updating from 10.3.2 or earlier and use a MySQL database, you must back it up prior to updating. See the "Additional Information for MySQL" section, below.
- If you are updating from 10.3.2 or earlier and have set up a loginhook, a custom serial port configuration, or have edited the "/etc/ttys" file for other reasons, you will need to back things up prior to installing this update. This is because a 10.3.3 or later update overwrites the file with a new copy when updating from 10.3.2 or earlier. The new file will set the serial port on an Xserve to communicate at 56 Kbps. If your serial device cannot communicate at this speed, you must edit this file to reduce the speed.

Installation

There are two ways to update to Mac OS X Server 10.3.9: Use Software Update or install from the standalone installer.

Software Update Installation

Software Update may have referred you to this document. For more information on this feature, see "How to Update Your Software."

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

A standalone installer is also available from Apple Downloads. Mac OS X Server Update 10.3.9 (Combo) updates Mac OS X Server 10.3.x to 10.3.8 to version 10.3.9.

Remote Installation

If you need to install the update on a remote computer, you can do so using either the Server Admin application or the "softwareupdate" command-line tool. Choose the method that works best for you.

Enhancements delivered with this update

This update delivers many enhancements. Because this is a combo update, it includes enhancements that are delivered with 10.3.9 and earlier 10.3.x updates. You can see the individual enhancement lists for 10.3.1, 10.3.2, 10.3.3, 10.3.4, 10.3.5, 10.3.6, 10.3.7, 10.3.8, and 10.3.9 updates.

Additional Information for MySQL

Data stored in MySQL databases with the version of MySQL that's preinstalled in Mac OS X Server 10.3.2 or earlier must be exported and imported again to be compatible with the version of MySQL that is preinstalled in Mac OS X Server 10.3.3 or later (a byte-ordering issue is addressed).

As with any upgrade install, you should back up your old data. In this particular upgrade, the following process is recommended to convert the data to the correct byte ordering:

Before upgrading, use the Terminal to export the data from your pre-10.3.3 database:

```
#  mysqldump -p table > backup-file.sql
```

or

```
#  mysqldump  --opt database > backup-file.sql
```

After the upgrade, and after initializing the MySQL database, import the data:

```
#  mysql -p table < backup-file.sql
```

or

```
#  mysql  database < backup-file.sql
```

Logic Pro 7: How to uninstall

This article has been archived and is no longer updated by Apple.
Logic Pro 7 does not include an uninstaller. If you need to uninstall the software, manually delete the items listed below. Some items may not be present, depending on what has been installed. Please be sure to address the items that are flagged in the Notes column before deleting files; removing some of these can have an impact on your other applications.

Path	File/Folder	Notes
/Applications/	Logic Pro	
/Applications/	WaveBurner	
/Library/Application Support/	GarageBand	1
/Library/Application Support/	Logic	
/Library/Audio/Apple Loops/	Apple Loops for GarageBand	1
/Library/Documentation/	Logic Acknowledgements.rtfd	
/Library/Receipts/	Logic Pro.pkg	
/Library/Receipts/	LogicPro701Updater.pkg	
/Library/Receipts/	Logic Pro Sound Library.pkg	
/Library/Receipts/	Logic Pro Bonus Sound Library.pkg	
~/Library/Application Support/	Logic	2, 3
~/Library/Preferences/	Logic PMData	2, 3
~/Library/Preferences/	com.apple.logic.pro.plist	2, 3
~/Library/Preferences/	Logic	2, 3

Notes:

1. Do not delete this folder if the application GarageBand is installed on your system.
2. Item only present after Logic Pro has been launched.
3. The tilde (~) in the path represents your Home folder.

Mac OS X 10.3.6, 10.3.7, 10.3.8: Slow login with many PostScript fonts

This article has been archived and is no longer updated by Apple.

After updating to Mac OS X 10.3.6, 10.3.7, or 10.3.8, if you have many PostScript Type 1 fonts installed, you may notice that it takes longer to log in than before updating. To fix this, download and install Mac OS X 10.3.9.

How much longer log in takes generally depends on the number of PostScript Type 1 fonts installed. With 1000 or more PostScript fonts, for example, you'd probably notice it. The login time may increase slightly with every login, even if you don't install additional PostScript Type 1 fonts.

Solution

Download and install the Mac OS X 10.3.9 update.

Published Date: Oct 7, 2016

AirPort for Windows unable to find or communicate with AirPort Base Stations

This article has been archived and is no longer updated by Apple.
Due to common configuration issues which are not AirPort specific, some Microsoft Windows computers may experience difficulty communicating with or configuring any wireless base station, such as an AirPort Express, AirPort Extreme, or a Linksys Wireless-G, for example. This may be caused by:

- Third-party software issues
- Running a Microsoft OS without the latest updates
- Entering an incorrect WEP or WPA password

When this happens, the wireless icon in the Task Bar indicates that the computer is connected to the wireless network, but you are unable to get any Internet data, and the Status window for the wireless connection shows that you have limited or no connectivity. You may also see that the computer has self-assigned a 169.254.xxx.xxx IP address.

To resolve the issue, try these steps:

1. Make sure that you have the latest Service Pack updates from Microsoft. You may also wish to get any additional updates that include changes to the networking abilities of the OS.

2. Check the website of the wireless access point manufacturer to see if there are any updates to the access point's firmware. In the case of Apple AirPort base stations, see the AirPort Support page to be sure that you have the latest firmware update for your AirPort product.

3. Be sure you are using the correct WEP or WPA key (password). Most Windows systems are set up without the ability to validate the user-entered password. If you mistyped it, the wireless computer will be using a different key than the wireless network.

4. Some third-party security software may impede traffic between your computer and the base station. Check for firewall or other security software, and make sure you understand how it is configured. Some VPN software may also operate a firewall without your knowledge, even if the VPN application is not actively running.

   Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Logic Express 7 box depicts curves feature not present in actual product

This article has been archived and is no longer updated by Apple.
The retail packaging for Logic Express 7 was printed with a mistake: The box depicts an arrangement window that contains non-linear automation curves. In reality, Logic Express 7 does not offer the non-linear automation curves feature.

Non-linear automation curves are a Logic Pro 7 feature only.

Published Date: Oct 7, 2016

Audio Cycle Recording does not work in Logic Express 7

This article has been archived and is no longer updated by Apple.

When you select a cycle range in the Arrange window, record enable a track, and press Record, the recording will not cycle. Instead, Logic Express 7 will start the recording as expected, but then stop recording once it reaches the end of the cycle range. The cycled range will continue to play until you press Stop.

There is currently no workaround for this issue. MIDI cycle recording does work as expected.

This document will be updated as more information becomes available.

iMovie HD: Close all iDVD projects before using iMovie‘s Magic iMovie feature

This article has been archived and is no longer updated by Apple.
If you have an iDVD project open and you use the Magic iMovie feature in iMovie HD to create a DVD, the project coming from iMovie may not complete.

In this situation, once iMovie HD creates a Magic iMovie, the computer switches applications to iDVD, but because you already have an iDVD project open, iDVD won't create a new project for your Magic iMovie content. Instead, you may receive an alert such as this:

> There is already a project open, do you want to save?

It doesn't matter if you select Yes or No; your Magic iMovie DVD project will not be created as expected. Instead, iDVD opens a new blank project.

If this happens to you:

1. Close the blank project in iDVD.
2. Switch back to iMovie; your Magic iMovie project should still be open and already assembled.
3. Use the Send to iDVD option to resend the project to iDVD: From the **File** menu, choose **Share**. Then click the iDVD button and click Share.

To avoid this issue, make sure that you close all iDVD projects before starting a new Magic iMovie.

Published Date: Oct 7, 2016

iMovie HD: Magic iMovie troubleshooting

This article has been archived and is no longer updated by Apple.
If the Magic iMovie feature of iMovie HD does not work as expected, here are some things to note and do to help resolve the issue.

Magic iMovie is designed to work with a DV or HDV camera that is connected to your computer through FireWire. This feature relies on scene break information stored on tape in the camera, as well as iMovie HD's ability to control the camera over the FireWire connection.

Make sure that your camera can connect over FireWire before using Magic iMovie. This feature is not designed to work with analog-to-DV bridge devices (such as those that allow you to connect a VCR or Hi-8 camcorder to your computer).

If you captured multiple scenes on your tape, but do not see multiple scenes in your Magic iMovie project, make sure that the "Start a new clip at each scene break" option is enabled in iMovie HD Preferences. Click here for additional iMovie scene detection troubleshooting information.

If you are having difficulty sending your Magic iMovie project to iDVD, click here for more information on resolving this issue.

iMovie: Do not connect or disconnect FireWire devices during capture or export

This article has been archived and is no longer updated by Apple.
When you're using iMovie to capture video from or export video to a FireWire video camera or DV device, avoid plugging or unplugging other FireWire devices (such as a drive, iPod, or iSight) into or from your computer.

Connecting or disconnecting devices during a capture or export could result in unexpected behavior, including:

- Corrupted video (including MPEG artifacts)
- Camera disconnection messages
- Dropped frames

If you need to connect (plug) or disconnect (unplug) a device, wait until the capture or export is complete.

Tables and charts copied between Keynote 1.1.1 and Keynote 2 are copied as images

This article has been archived and is no longer updated by Apple.
When you copy a table or chart from a slide in Keynote 1.1.1 and paste it into Keynote 2 (or vice versa), the item is copied as an image. All chart or table properties that have been set will not be retained. This won't be an issue if you don't need to edit the table or chart any further.

However, if you want to have this luxury, instead of copying and pasting items from one Keynote version to another, open the Keynote 1.1.1 document directly in Keynote 2 instead of in its native application (you can't open a Keynote 2 document in Keynote 1.1.1). Any table or chart that you then copy and paste within Keynote 2 will have its properties retained.

GarageBand: Enhance Timing may place notes after the end of the region

This article has been archived and is no longer updated by Apple.

To fix timing inconsistencies, the Enhance Timing feature moves notes to the closest grid position. When you quantize a region, a note (or notes) that occur at the end of a selected region may seem to disappear. In actuality, it's just been moved to beat 1 in the measure that follows your selected region. This occurs if the note falls closer to beat 1 in the subsequent measure than the final beat in your selected one.

Keynote 2: Print Previews are black and white

This article has been archived and is no longer updated by Apple.
Under some conditions, a slide with colored objects may appear as black and white when you select a Print Preview.

This only occurs under the following conditions:

- A black-and-white printer is the current printer.
- You are are using the "White" theme and have a colored object on one of the slides.
- The Soft Proof checkbox at the bottom of the Preview window is checked.

To see color in the Print Preview window, either zoom in or out of the document, or uncheck the Soft Proof checkbox.

This document will be updated as more information becomes available.

Sudden Motion Sensor: Advanced Tips

This article has been archived and is no longer updated by Apple.

Beginning with the PowerBook G4 (12-inch 1.5GHz), PowerBook G4 (15-inch 1.67/1.5GHz), and PowerBook G4 (17-inch 1.67GHz), PowerBook G4 computers feature a Sudden Motion Sensor.

Apple has adjusted this feature carefully to provide the best balance between protecting the hard drive and preventing unwanted activation of the Sudden Motion Sensor. Most PowerBook G4 owners will never need to turn this feature off, and Apple suggests that you not modify the settings unless absolutely necessary.

In some environments, such as live concert halls, recording studios, or dance clubs, external vibrations may be major enough to cause the module to unexpectedly park the hard drive heads, resulting in interrupted sound or video playback. In these situations, you may find that you want to disable the feature temporarily.

To disable the Sudden Motion Sensor:

First, find the current status of Sudden Motion Sensor:

1. From the Finder's **Go** menu, choose **Utilities**.
2. In the Utilities folder, open Terminal.
3. When the command line appears, type `sudo pmset -g` and press Return.
4. Type in the administrator password when prompted and hit Return. This command queries the computer for the current setting of the Sudden Motion Sensor, which you can determine by locating the ams entry (in Mac OS X 10.3) or the sms entry (in Mac OS X 10.4) and looking to the right to determine its value. The default setting is "1" (turned on).

Disabling the Sudden Motion Sensor in Mac OS X 10.3:

1. In Terminal, which should still be open from the previous step, you can disable the Sudden Motion Sensor by typing `sudo pmset -a ams 0` and pressing Return (changing the setting to a zero disables the module).
2. Type your administrator password when you are prompted and press Return.
3. Type the `sudo pmset -g` command again to be sure that the setting has been applied.

Disabling the Sudden Motion Sensor in Mac OS X 10.4:

1. In Terminal, which should still be open from the previous step, you can disable the Sudden Motion Sensor by typing `sudo pmset -a sms 0` and pressing Return (changing the setting to a zero disables the module).
2. Type your administrator password when you are prompted and press Return.
3. Type the `sudo pmset -g` command again to be sure that the setting has been applied.

Any changes that you make to the Sudden Motion Sensor setting remains in effect even after you restart the computer. If you choose to disable the Sudden Motion Sensor, Apple recommends that you re-enable it as soon as possible in order to take full advantage of the feature.

To re-enable the Sudden Motion Sensor:

First, find the current status of Sudden Motion Sensor:

1. From the Finder's **Go** menu, choose **Utilities**.
2. In the Utilities folder, open Terminal.
3. When the command line appears, type `sudo pmset -g` and press Return. Type your administrator password when you are prompted and press Return. If you have the Sudden Motion Sensor turned off, the value of the ams entry (in Mac OS X 10.3) or sms entry (in Mac OS X 10.4) will be a zero (0).

Re-enabling the Sudden Motion Sensor in Mac OS X 10.3:

1. If the above command returns a zero, you can re-enable the Sudden Motion Sensor by typing `sudo pmset -a ams 1` and pressing Return.
2. Type your administrator password when you are prompted and press Return.
3. Type the `pmset -g` command again to be sure that the setting has been applied.

Re-enabling the Sudden Motion Sensor in Mac OS X 10.4:

1. If the above command returns a zero, you can re-enable the Sudden Motion Sensor by typing `sudo pmset -a sms 1` and pressing Return.
2. Type your administrator password when you are prompted and press Return.
3. Type the `pmset -g` command again to be sure that the setting has been applied.

iMovie HD: Effects display in black bars of clips with different aspect ratios

This article has been archived and is no longer updated by Apple.
In iMovie HD 5.0, you should be aware of unusual things that can happen when mixing clips with different aspect ratios within the same project. One thing that can happen is when you import a clip that has a different aspect ratio than the project you're bringing it into and then apply certain effects (such as Fog), the effect will also render over the black bars outside of the video image in the frame.

In the following example, we imported a DV widescreen clip into a standard DV project (4:3 aspect ratio) and added the Fog effect. Note how the Fog appears over the entire frame and not just the image:

As a workaround, you can create a new iMovie HD project in the same aspect ratio as the clip in question, import the clip, apply the effect, and export the rendered clip as a movie. Then import the revamped clip into your original project. You can also cut and paste between projects.

Keynote 2: Text containing ligatures may not behave as expected in an object build slide

This article has been archived and is no longer updated by Apple.
If you're creating a slide in Keynote 2 and want to animate the text, some of the characters may not behave as expected if a word contains a *ligature*. A ligature is a feature used by some fonts to combine two or more text characters into one. For example, a font may combine the "fi" in "find" into one character so that the dot on the "i" gets absorbed by the top curve of the "f" instead of having the two characters interfere with each other.

In Keynote 2, you can combine text characters with ligatures if the font you're using supports this feature. However, some individual characters in a ligature combination, such as "fl" (as in "flower") and "ff" (as in "caffeine"), will move together as a single entity when you apply certain character effects, such as Expand or Typewriter.

This is normal. If you don't want this to happen (you want each character to behave independently), set the font to not use ligatures (from the **Font** menu, choose **Ligature**, then **Use None**).

Update to iMovie HD 5.0.1 to avoid sync issues

This article has been archived and is no longer updated by Apple.
To avoid synchronization issues during playback, update iMovie HD 5.0 to version 5.0.1 if your projects contain any of the following:

- Titles
- Transitions
- Video effects

This includes projects in Widescreen, standard, PAL, and NTSC formats.

You can download the update using Software Update. - Audio/video sync while playing back standard DV movies is better. - HDV exports to tape longer than 8 minutes are now possible. - compatibility with certain analog-to-digital converter boxes is improved. - it is now possible to record video sent by a DV camera when there is no tape in the device (e.g. analog passthru or live camera images).

Importing a Motion or iMovie project into Final Cut Express HD

This article has been archived and is no longer updated by Apple.
If you want to import Motion or iMovie projects into Final Cut Express HD, you will need to have the corresponding application installed on the same computer. In other words, if you want to import a Motion (or iMovie) project, Motion (or iMovie) must also be installed on the same computer that houses Final Cut Express HD.

If the corresponding application is not installed, you will get an "Unrecognized File" alert when you try to import the project into Final Cut Express HD. To avoid seeing this message, be sure that the project's native application is installed on your target machine.

iDVD 5: Create DVDs from a DV camera with OneStep DVD

This article has been archived and is no longer updated by Apple.
iDVD 5 has a new feature called OneStep DVD that allows you to create DVDs directly from your DV camera in one step without having to use iMovie. The resulting DVD will play your movie automatically when you insert it in a DVD player.

Although OneStep DVD makes DVD creation quick and easy, it does have the following caveats:

- You will not be able to edit your movie in any respect.
- The DVD cannot be customized. No menus or slideshows can be added.
- The DVD will not have chapter markers.

If you're OK with all the above, then here's how to create a DVD using OneStep DVD:

1. Connect your DV camera to your computer.
2. Turn on the camera (no need to rewind the tape).
3. Set the camera to VTR mode.
4. Open iDVD and click the OneStep DVD button in the welcome screen (or from the **File** menu, choose **OneStep DVD** if another project is already open).
5. Insert a recordable DVD disc into your computer.

That's it! iDVD takes over from there. If you're interested in finding out more about the creation process, read on.

Capturing video
In OneStep DVD mode, iDVD automatically rewinds the tape in your DV camera and then captures video to your computer's hard drive. If you press the Play button on your camera while it's being rewound, iDVD will begin to capture at that point. While capturing, iDVD displays a thumbnail image that shows the current point in the video.

iDVD also displays two time indicators. The first indicates the amount of video that iDVD has captured so far. The second indicates the amount of video that could potentially be captured, based on the available space that remains on your hard drive. You may notice that the second indicator decreases a little faster than the amount that the first one increases. This is because iDVD needs to make sure that there will be extra hard drive space left available to encode your video and audio and then structure that material into the DVD-Video format.

Stopping the capture
You can press the Stop button on screen at any point while your video is being captured. If you do this, a dialog appears, giving you options to cancel the current project or continue creating the DVD using the video that was captured up to that point. If you don't manually stop the capture, iDVD will stop capturing video automatically when the tape ends or after 10 seconds of sensing that no video is coming from the camera.

Creating the DVD
After capturing, iDVD prepares the DVD structure and begins to process the video that was captured. During this stage, iDVD encodes the captured DV video into MPEG-2 format, which is used in standard DVDs (you'll see a thumbnail image, representing the frames being encoded). When it's done, iDVD transcodes the audio into uncompressed PCM audio. You can cancel the OneStep project at any time up to this point, and your DVD will be left blank.

The last stage in the process is burning the content to a recordable DVD disc. After iDVD completes the burn, it will eject the disc.

Note: OneStep DVD will only capture from recorded tape on a DV camcorder or deck. OneStep DVD will not work with analog-to-DV converters. It will also not work if you are using your camcorder or deck as a pass-through device to digitize from an analog source (such as VHS or Hi-8). In order to function, OneStep DVD reads the timecode from your DV tape and it relies on DV device control to communicate with the camera or deck.

Some DVD-RW discs cannot be played in DVD Player

This article has been archived and is no longer updated by Apple.

Some SuperDrive models are capable of burning DVD-Video content onto certain types of DVD-RW media that the Mac OS X DVD Player cannot recognize.

If DVD Player doesn't recognize a disc, you may see a "Not Permitted" or "Supported disc not available" message in the Viewer window when you try to play the disc. This issue may occur with a variety of SuperDrives and media types or brands.

As a workaround, use DVD-R disc media when burning DVD-Video content.

Mac OS X: Asian language characters are unreadable when pasted into a Classic application

This article has been archived and is no longer updated by Apple.
Asian text may become unreadable if you copy text from a native Mac OS X application (such as TextEdit) and paste it into a Classic application (such as SimpleText). This may happen if you're using Mac OS X 10.2 or later.

To resolve this issue, instead of copying and pasting text, drag and drop it like this:

1. Open both applications so that you can see the original text and the document in which you want to place the text.
2. Select the text in the original document that you want to transfer. If you want to select it all, press Command-A.
3. Drag the selected text and drop it in the Classic application's document window. That's it!

iDVD 5: 12-bit audio may result in sync issues when using OneStep DVD

This article has been archived and is no longer updated by Apple.
Most DV cameras allow you to record using one of two audio settings: 12-bit or 16-bit audio. If you used both of these settings on one tape (some of the footage was shot with 12-bit audio, and some was shot with 16-bit) and then use iDVD 5 to create a OneStep DVD project, iDVD may have difficulty keeping the audio synchronized with the video.

To avoid this issue, always keep your camera set to 16-bit audio, if possible. This will ensure higher quality audio and better compatibility with iLife applications.

Mac OS X 10.3 and later: IP over FireWire may prevent using other FireWire devices

This article has been archived and is no longer updated by Apple.

If you network two Macs over FireWire, such as using IP over FireWire, you may not be able to use other devices on that FireWire bus. This means that a connected iPod or iSight, for example, may not be recognized properly, or may even appear on another Mac computer that is part of your FireWire network.

To prevent this from happening, disconnect your other Macs from the FireWire network before using any FireWire devices that exhibit this issue. If you have a FireWire card installed (or an open PCI or PC card slot to install one), you can alternatively use it to connect the computers on a different FireWire bus from your FireWire devices (connect these to your computer's built-in FireWire ports.

GarageBand 2.0: Songs cannot exceed 999 measures

This article has been archived and is no longer updated by Apple.

In GarageBand 2.0, the end-of-song marker cannot be moved beyond measure number 999. However, it is possible to record a Real Instrument track beyond that point, but if you do, the portion of the recording that extends beyond measure 999 will not be playable. If you want to use that portion in your song, split the region at the end-of-song marker (at the end of measure 999) and drag the overmatter into any area between measures 1 and 999.

Tip: Consider creating a new Real Instrument track to move the split region into - otherwise, you might overlap regions.

In GarageBand 3.0 or later, this limit increases from 999 to 1999.

PowerBook G4 (12-inch 1.5GHz), PowerBook G4 (15-inch 1.67/1.5GHz), PowerBook G4 (17-inch 1.67GHz): Installing individual applications from iLife ‘05

This article has been archived and is no longer updated by Apple.

iLife 05 is preinstalled on PowerBook G4 (12-inch 1.5GHz), PowerBook G4 (15-inch 1.67/1.5GHz), and PowerBook G4 (17-inch 1.67GHz) computers. However, if you ever need to reinstall certain applications from iLife 05, you can do so. When you go through the installer, you may not be able to select an individual application. (When you try to select just one application, all the applications are checked.) Simply uncheck the applications that you do not want to install.

About the Apple Remote Desktop 2.2 Update

This article has been archived and is no longer updated by Apple.

The Apple Remote Desktop 2.2 Update improves reliability and compatibility, and it's recommended for all users of Apple Remote Desktop 2. Note: Be sure to quit the Remote Desktop administration application before updating to version 2.2. If the admin application is open when the updater is run, you will have to add your client computers again and recreate your computer lists.

Here are some of the improvements included with this version:

Software Distribution

- Now correctly copies files to symlinked directories such as "/tmp".
- Improved reliability for installing from .mpkg files.
- Can now install iTunes 4.7 and iTunes 4.7.1.

Asset Management

- Improved reliability for generating system and software reports.
- Correctly reports systems that have more than 2 GB of memory installed.

Remote Assistance

- During control sessions, keys typed on Japanese keyboards will display correctly.
- Improved reliability for the Share Screen command.

Remote Administration

- Brightness is no longer reset when a client is shut down during display sleep.

Other

- Compatibility with Mac OS X 10.4 Tiger.
- Scanners now retain settings across Admin sessions and/or changed locations.
- Improvements in reporting the correct status of computers.
- Improved launch time of the Apple Remote Desktop application.

Using Aatrix Top Pay in Canada

This article has been archived and is no longer updated by Apple.

PowerBook G4 (12-inch 1.5GHz), PowerBook G4 (15-inch 1.67/1.5GHz), and PowerBook G4 (17-inch 1.67GHz) computers in North America come bundled with Aatrix QuickBooks, including Top Pay. The default installation of Top Pay has a payroll feature that uses United States information. If you want to use the payroll feature but live in Canada, you will need to switch out a file.

To modify Top Pay for use in Canada:

1. Open the QuickBooks NUE folder (it's in the Applications folder).
2. Open the Aatrix Top Pay 15 folder.
3. Locate the Aatrix Top Pay icon and drag it to the trash.
4. Double-click the For Users in Canada.zip icon. The file will unzip and create a folder called For Users in Canada.
5. To run Aatrix Top Pay Canada, from QuickBooks, go to the Employees option and choose Payroll.

About Security Update 2005-001 for Mac OS X

This article has been archived and is no longer updated by Apple.
This document describes Security Update 2005-001, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How To Use The Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Security Update 2005-001

- at commands
  Available for: Mac OS X v10.3.7, Mac OS X Server v10.3.7
  CVE-ID: CAN-2005-0125
  Impact: Updates the "at" commands to address a local privilege escalation vulnerability
  Description: The "at" family of commands did not properly drop privileges. This could allow a local user to remove files not owned by them, run programs with added privileges, or read the contents of normally unreadable files. This update patches the commands at, atrm, batch, atq, and atrun. Credit to kf_lists[at]digitalmunition[dot]com for reporting this issue.

- ColorSync
  Available for: Mac OS X v10.3.7, Mac OS X Server v10.3.7, Mac OS X v10.2.8, Mac OS X Server v10.2.8
  CVE-ID: CAN-2005-0126
  Impact: Malformed ICC color profiles could overwrite the program heap, resulting in arbitrary code execution.
  Description: An out-of-specification or improperly embedded ICC color profile could overwrite the program heap and allow arbitrary code execution. There are no known exploits for this issue. With this update, ColorSync will reject incorrectly-formed ICC color profiles.

- libxml2
  Available for: Mac OS X v10.3.7, Mac OS X Server v10.3.7
  CVE-ID: CAN-2004-0989
  Impact: The libxml2 library contains unsafe code that may be exploited in applications linked against it.
  Description: This update fixes several functions in the libxml2 library that have been identified as unsafe due to potentially exploitable buffer overflows.

- Mail
  Available for: Mac OS X v10.3.7 Client, Mac OS X Server v10.3.7
  CVE-ID: CAN-2005-0127
  Impact: Email messages sent from a single machine can be identified
  Description: A GUUID containing an identifier associated with the Ethernet networking hardware was used in the construction of an RFC-822 required Message-ID header. Mail now hides this information by computing the Message-ID using a cryptographic hash of the GUUID concatenated with data from /dev/random. Credit to Carl Purvis for reporting this issue.

- PHP
  Available for: Mac OS X v10.3.7, Mac OS X Server v10.3.7, Mac OS X v10.2.8, Mac OS X Server v10.2.8
  CVE-ID: CAN-2003-0860, CAN-2003-0863, CAN-2004-0594, CAN-2004-0595, CAN-2004-1018, CAN-2004-1019, CAN-2004-1020, CAN-2004-1063, CAN-2004-1064, CAN-2004-1065
  Impact: Multiple vulnerabilities in PHP, including remote denial of service and execution of arbitrary code
  Description: PHP is updated to version 4.3.10 to address several issues. The PHP release announcement for version 4.3.10 is located at http://www.php.net/release_4_3_10.php.

- Safari
  Available for: Mac OS X v10.3.7, Mac OS X Server v10.3.7, Mac OS X v10.2.8, Mac OS X Server v10.2.8
  CVE-ID: CAN-2004-1314
  Impact: When Safari's "Block Pop-Up Windows" feature is not enabled, a malicious pop-up window could appear as being from a trusted site
  Description: If the "Block Pop-Up Windows" feature is enabled, then this issue does not occur. If the "Block Pop-Up Windows" feature is not enabled, a user can be mislead about the content of a Pop-up window if they used an untrusted link to navigate to a site they wanted to view. This update corrects the issue regardless of the "Block Pop-Up Windows" setting. Credit to Secunia Research for reporting this issue.

- SquirrelMail
  Available for: Mac OS X Server 10.3.7
  CVE-ID: CAN-2004-1036
  Impact: SquirrelMail is updated to address a cross-site scripting vulnerability
  Description: A cross-site scripting vulnerability in SquirrelMail allowed email messages to contain content that would be rendered by a user's web browser. SquirrelMail is updated to address this issue. Further details are available from the SquirrelMail website: http://www.squirrelmail.org/.

Keynote 2: Printing issues with HP DeskJet 970 and DeskJet 995 printers

This article has been archived and is no longer updated by Apple.
When you print from Keynote 2 to an HP DeskJet 970 or DeskJet 995 printer, you may see one or more of the following issues:

- Chart labels and Axis labels are incorrect.
- Pie charts lose their form and scatter.
- When two charts are printed on a page, they have the wrong series fills.
- Chart colors have intermittent issues with the following Keynote themes:
  - Letterpress
  - Notebook
  - White
  - Parchment
  - Crayon Line
  - Pushpin
  - Gradient

This document will be updated when additional information is available.

iWork: Images print incorrectly on some printers

This article has been archived and is no longer updated by Apple.

When you print documents from Pages or Keynote 2, some images may be randomly swapped for others when printing to some printers. This can happen with documents that contain images with drop shadows (such as those in the Travel Journal template in Pages 1.0).

Upgrading to Mac OS X 10.4 or later will resolve this issue. However, if you are still using Mac OS X 10.3.x and are unable to upgrade, follow these steps to workaround the issue:

1. In the Pages or Keynote 2 Print dialog, click the "Save as PDF" button to save a PDF file of your document.
2. Open your PDF file in the Preview application.
3. Print the document from Preview.

This document will be updated as more information becomes available.

Apple Hardware Test: PowerBook trackpad response may be slow or jumpy

This article has been archived and is no longer updated by Apple.

When you use Apple Hardware Test on a PowerBook G4 (12-inch 1.5GHz), PowerBook G4 (15-inch 1.67/1.5GHz), or PowerBook G4 (17-inch 1.67GHz) computer, the trackpad will track very slowly and the pointer may seem to move unevenly across the screen.

This behavior is normal for the trackpad when used with Apple Hardware Test. To improve navigation when using this software, use an external mouse or use the following keyboard shortcuts:

Key	Action
Arrow up/down	Pick a language to use
Return/Enter	Select a language to use
Tab	Cycle through the tabs (Hardware Test, Hardware Profile, Apple)
G	Start the Quick Test
E	Start the Extended Test
Shift-R	Restart
Shift-S	Shut down
Command-period	Stop the testing

AirPort 4.1: Network status may display incorrectly on a Graphite base station

This article has been archived and is no longer updated by Apple.
When AirPort Admin Utility 4.1 is used in Mac OS X 10.3 Panther, it may display an incorrect Network status for the first-generation AirPort Base Station (Graphite).

The Network tab information will always show that "Enable DHCP server on Ethernet" and "Enable AirPort to Ethernet bridging" are off, even after you've turned them on.

If you have selected these checkboxes and saved the configuration, these features will be active, despite the status message.

This document will be updated as more information becomes available.

iMovie displays a -43 error when exporting or importing files

This article has been archived and is no longer updated by Apple.
When using iMovie 3.0 or later, you may get a -43 error message when you try to do the following:

- Send an iMovie project to iDVD.
- Import files into iMovie.
- Export projects to QuickTime using iMovie's Share feature.

If you come across this error, check to see if you have any third-party plug-ins installed in the following locations:

~/Library/iMovie/
/Library/iMovie/

If so, temporarily disable the plug-in by renaming or removing the iMovie plug-ins folder where the plug-in resides. Then open iMovie again and test to see if the export (or import) succeeds.

For example, older versions of the Slick plug-ins suite may cause this symptom. Gee Three has an update for their Slick plug-ins here. If you have plug-ins from another company, check with the plug-in developer for possible plug-in updates which may resolve this issue.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Keynote 2: Exported QuickTime slideshow‘s audio sounds doubled when played

This article has been archived and is no longer updated by Apple.
If you export a Keynote 2 presentation with audio in QuickTime format, save it as an Interactive Slideshow movie, and then open the exported movie from the Finder by double-clicking the movie file, you might hear what sounds like an echo. This may happen if you have your Finder window set to Columns view and the Preview pane is set to display content (the Preview disclosure triangle is open).

In this situation, the first time that you click the slideshow file in the Finder to select it, the audio will start playing in the Preview pane. If you then double-click the file to open the slideshow, the slideshow will be playing both in the Finder's Preview pane and in QuickTime Player.

To break-up the double play, either click the Preview disclosure triangle or click a different file in the Finder to stop the Preview pane play. To prevent this from happening in the future, switch the Finder from Columns view to List or Icons view.

Logic Pro won‘t open after updating it in Software Update

This article has been archived and is no longer updated by Apple.
Logic Pro may not open after being updated by Software Update, due to an issue with your active languages configuration.

If you encounter this issue, reinstall from the original Installation disc (such as version 7.0 or 7.1) then re-run an update (such as 7.0.1 or 7.1.1), using these steps:

1. Locate the Logic Pro application in the Finder and drag it to the Trash.
2. Reinstall Logic Pro from the Installation DVD.
3. Use Software Update to update Logic Pro.
4. After the update is finished, customize your languages again.

Before installing future updates to Logic Pro, be sure to activate each language again.

Xserve RAID: Not a replacement for a data backup strategy

This article has been archived and is no longer updated by Apple.

The Xserve RAID is a robust device designed to provide fast and reliable access to large amounts of data. An Xserve RAID can compensate for single drive failures (in a RAID 5 configuration), but it is not designed to be a replacement for a backup strategy. As with any computing device, unforeseen circumstances can lead to data loss.

To prevent permanent data loss, it is important to maintain a regular backup strategy. Keeping multiple staggered copies of important data is best, and it is even better to keep backups of data in an offsite location. Tape libraries or additional Xserve RAIDs can provide the storage capacity required for large amounts of backup data.

Power Mac G5 won‘t capture high definition video

This article has been archived and is no longer updated by Apple.
If you aren't getting the performance you hoped for when you capture high definition video using a third-party video capture card and Power Mac G5, here are some things to try.

- Review the set-up instructions that came with your card to ensure that you have installed it in the correct PCI slot (some cards only work in certain slots).
- Consult with the video capture card manufacturer and make sure that the card will work with your configuration. You should also check the manufacturer's website to see if there's a list of computer configurations that have been qualified to work with their cards.
- If you're using Final Cut Pro, visit the Final Cut Pro specifications website to view a list of devices that have been qualified to work with Final Cut Pro.
- If you're using a non-Apple application, consult with its manufacturer to verify whether your Power Mac G5's configuration is compatible with their product.

iPhoto: Do not use the Revert to Original command after removing or renaming the original

This article has been archived and is no longer updated by Apple.
iPhoto automatically manages both original and working copies of your pictures inside your iPhoto Library. If you interfere with its management by removing or renaming the originals manually or via a third-party utility (such as iPhoto Diet), then you must not use the Revert to Original command.

If you remove the original by moving it somewhere else, the Revert to Original command in iPhoto will replace your working copy with the "nothing" that it finds in the original's place (basically, a zero-K file). If this happens, you will need to re-import the original from wherever you moved it. If you didn't keep a copy of the picture outside of iPhoto, then your only copy is erased (as long as you're not using a secure delete option, an erased file will persist on your disk for an indefinite amount of time, and it might be recoverable by third-party software).

Warning: If you want to try file recovery, stop using the computer immediately and consult the documentation for your third-party file recovery software, or consult a file recovery specialist. By not using the computer, you will increase your chances of recovering the file.

Additionally, iPhoto will unexpectedly quit if you try to edit a RAW photo for which the original has been removed.

To prevent this issue:

1. Leave the contents of your iPhoto Library folder alone, and allow iPhoto to manage the images as designed.
2. Update to iPhoto 5.0.1 or later. This update will prevent the loss of non-RAW images, but it does not eliminate issues with RAW files.
3. Minimize the risk of image loss by keeping good backups:

    - Export your current library as a backup copy.
    - Back up new photos as soon as possible after taking them.

    If you already have good backup habits and copies of all your images outside of iPhoto, then obviously there is no need to export your current library. For those of you who haven't been backing up, exporting your current library will start you on the right path.

When the original of a non-RAW image is missing in iPhoto 5.0.1, iPhoto will detect this when you use the Revert to Original command, and it will make this command unavailable to that image. If you then edit this surviving image, it will subsequently be copied to the Originals folder, and your new changes will become the edited working copy.

For RAW images, the issues persist as described above (both for image loss and unexpected quitting).

Exporting your current library

This will require that you have free space on your hard disk equivalent to 50 to 100 percent of your iPhoto Library, with the exact amount dependent on the state of your library. If you don't have and can't free up that much space, the next easiest alternative would be to export to an external USB 2.0 or FireWire hard disk, or to another computer via File Sharing.

1. **Click the Finder icon in the Dock.**
2. **In the Finder Window, select Desktop.**
3. **From the File menu, choose New Folder, and name the folder Exported iPhoto Library.**
4. **Open iPhoto, and select your Library from the Source list.**
5. **Click the Keywords button.**

6. **Check your keywords list for RAW. If RAW is in your keywords list, stop here and review For libraries containing RAW images, below. Otherwise, continue to the next step.**
7. **Be sure that no keywords are selected. A selected keyword will be blue or red. Click it to turn it gray (deselected).**
8. **From the Share menu, choose Export.**
9. **Click the File Export tab.**
10. **Set the Format pop-up menu to Original.**
11. **Click the Export button.**
12. **In the navigation sheet that appears, click Desktop, then click the Exported iPhoto Library folder.**
13. **Click OK.**

For libraries containing RAW images

If your library contains both RAW and non-RAW images, you will need to export your Library once for each type. This means that you would follow the steps above twice. Do your first pass for the non-RAW images by replacing step 7 with this alternate:

> **7. To see everything that is not RAW, click the RAW keyword while pressing the Option key on your keyboard. The keyword turns red when you Option-click it, which indicates that you are doing a "not" search.**

Do the RAW images on your second pass, by replacing steps 7 and 10 with these alternates:

> **7. To see only RAW images in a selected album or in your Library, click the RAW keyword in your Keywords list. The keyword will be blue when it is selected.**

> **10. Set the Format pop-up menu to JPEG (this may seem confusing -- see Notes for explanation).**

Notes:

1. **Under normal circumstances, you can export a RAW image as Original (step 10), and you will get a copy of the original RAW file. However, if you have removed any RAW originals, what you will have left is the JPEG working copies with the RAW keyword, so you would not be able to export them as "Original" (doing so would result in a file not found message). This article is geared toward readers who have removed some originals, so setting the menu to JPEG in step 10 ensures that you will get JPEG copies of RAW images for which the original RAW file has been removed. If you are certain that you have not removed any originals, and you just want to start a backup regimen, then it's OK to select Original.**
2. **If your situation requires exporting as JPEG, then it's likely that within those RAW-keyworded images you have both missing originals and present originals. After doing the JPEG export to get copies of them all, you can then use the Finder to search your iPhoto Library folder for the present originals, which are identifiable by the filename extension that your camera uses (such as .nef, .cr2, .crw, and so forth). This way you can save the RAW originals that are present without having to negotiate the "file not found" messages in iPhoto.**
   a. **Click the Finder icon in the Dock.**
   b. **From the File menu, choose Find.**
   c. **Set the "Search in" menu to "Specific Places".**
   d. **Click the Add button.**
   e. **Navigate to your Pictures folder, and select the iPhoto Library folder.**
   f. **Click Choose.**
   g. **Deselect the checkbox for other locations so that only your iPhoto Library is being searched.**

   h. **Search for items whose name contains the file extension used by your camera (such as .nef or .cr2). This is shown in the picture above.**
   i. **Click Search.**
   j. **You can drag the RAW files you find in the results window to another folder in the Finder for safe keeping.**

Backing up new photos as you take them

Here are two different ways to go about backing up your photos as you take them. If you like to connect your camera directly to the computer, you could use this method:

1. **Import into iPhoto as you normally would.**
2. **In the Source list, select Last Roll.**
3. **From the Share menu, choose Export.**
4. **Click the File Export tab.**
5. **Set the Format pop-up menu to Original.**
6. **Click the Export button.**

7. **In the navigation sheet that appears, select a location (such as Desktop or Pictures) where you want to make a folder for backing up your latest shoot.**
8. **Click the New Folder button, name the folder, and click Create.**
9. **Click OK.**

If you prefer to use a card reader, try this method:

1. **Use the Finder to copy your images from the card reader to a folder on your computer. (This will be your backup copy.)**
2. **In iPhoto, from the File menu, choose Add to Library to import them from the desktop into iPhoto.**

Now that you have an extra copy, the safest thing to do is move it to an external hard disk, copy them to another computer via file sharing, or burn a disc. External hard disks (USB 2.0 and FireWire) are nice to have, because they're fast, flexible, and allow you to save pictures until you have enough to fill a DVD. Following this backup strategy will eliminate the risk of losing images due to your management of the iPhoto Library.

iMovie HD: Supported video formats

This article has been archived and is no longer updated by Apple.
iMovie HD supports multiple video formats and allows you to create projects that are tailored to your specific video format. You can use the following formats in iMovie HD:

- DV
- DV Widescreen
- HDV 1080i (25 and 30 fps)
- HDV 720p (25 and 30 fps)
- MPEG 4 Simple Profile
- iSight

When you create a new project in iMovie HD, click the Video Format disclosure triangle (if it isn't open already) and choose the format for your footage at hand from the pop-up menu.

Make sure that you choose the correct format that matches your footage to avoid additional video clip transcoding. This ensures the highest quality import and may save disk space, depending on the format.

Note: If you attempt to import footage from a camera (other than iSight) that does not match the project format you selected, one of two things will happen:

- If this is the project's first import, iMovie HD may automatically change the project format to match the footage that you're importing.
- iMovie HD may display a warning message that it cannot import the footage because it does not match the project's format.

iMovie HD also allows you to import most QuickTime-compatible formats. For more information on how to do this, click here. If you need to mix different footage formats from multiple cameras, click here to find out how to use them all together in one iMovie HD project.

Published Date: Oct 10, 2016

iMovie HD: How to mix video formats within a project

This article has been archived and is no longer updated by Apple.
You'll get best results from iMovie if you use the same video format for all of the footage in a project. If you don't have this option, then these steps may allow you to mix various media footage (DV, HDV, MPEG-4) in the same project using iMovie HD.

Normally, when you attempt to import footage from a different camera type than what's used in your current iMovie project (iSight footage is the exception—you can import it into any project format), iMovie won't let you and may give you the following warning message:

> "The attached camera uses a different video format than your project's format. To use this camera, disconnect any other tape-based cameras, then create a new, empty project."

Don't worry; it can be done. If you need to mix footage from different camera types, follow these steps:

1. Import the additional footage into a new iMovie project.
2. Select the imported footage in the clips pane or timeline and copy the clips to the clipboard (from the **Edit** menu, choose **Copy**).
3. Close the project and open the project in which you want the clips to appear.
4. Paste the clips into the clips pane or timeline (from the **Edit** menu, choose **Paste**).

iMovie HD will automatically convert the footage so that it can be used in this project. Please be aware that depending on the project and footage formats, the footage may be converted to a lower quality.

If your footage is of a different aspect ratio, it may be letterboxed or pillarboxed to fit the project you are pasting into. If you need to add an effect to such footage, consider adding the effect in the clip's original project before cutting and pasting it into the new project.

Remote Desktop 2: How to specify a port number for a VNC client

This article has been archived and is no longer updated by Apple.

Remote Desktop administration software, by default, uses port 5900 to communicate with a VNC server. Occasionally, it's necessary to add a VNC server that listens on another port. Here's how to use Remote Desktop to change the port number for a VNC client:

1. Add the VNC client to your list.
2. Select the VNC client, and Get Info for it.
3. Click the Edit button.
4. Edit the IP Address field to include the port number. For example, to change the number to port 5902, add it like this:

```
10.0.0.5:5902
```

5. Click Done to apply the changes.

Note: This only works for the IP address. If you edit the DNS name, it will not have the same effect.

Mac OS X: Some applications are not selectable when using Limitations, Capabilities, or Parental Controls

This article has been archived and is no longer updated by Apple.
Some applications do not work properly with the Accounts preference option known by the names "Limitations" (10.2), "Capabilities" (10.3), and "Parental Controls" (10.4). Mac OS X 10.4 will actually warn you when such an application is selected, by giving the alert message:

> "Application_Name does not work with the limitations you have selected."

However, Mac OS X 10.2 and 10.3 do not have this warning. If you set a user to have "Some Limits" or a "Simple Finder," and then allow access to one of these particular applications before quitting System Preferences, that application will no longer be selected in the Allow list the next time you open System Preferences and access this user's account. This affects Mac OS X and Mac OS X Server versions 10.2 and later.

Note: This issue sounds similar to one involving unbundled applications, but is different.

If you have an application that exhibits this behavior, contact the developer of the application to report this issue.

Software developers should note that Cocoa applications must have a unique Bundle ID, and Carbon and Classic applications must have a unique Creator code as stated in the Mac OS X Developer System Overview documentation.

Mac OS X 10.3 or later: Printing in Classic using a Mac OS X inkjet printer driver

This article has been archived and is no longer updated by Apple.

If you're using a Classic application, you can print from it using a Mac OS X printer driver. This applies only to inkjet (raster) printers that use a single driver to print from either Mac OS X or Classic applications. Here's how to do this in Mac OS X 10.3 or later.

Note: Mac OS X 10.4 or later automatically sends Classic print job to the Mac OS X print queue, but the steps in this article can be used if you are unable to print normally from Classic.

1. From the Finder **Go** menu, choose **Go to Folder**.
2. In the resulting dialog, type `/Applications (Mac OS 9)/Utilities` and then click Go (or press Return).

   Note: This command only works if your Mac OS 9-related folders are on the same volume as Mac OS X. If they are on a different volume (or partition), navigate to the Utilities folder in the Applications (Mac OS 9) folder on that volume.

3. Double-click Desktop Printer Utility to open it.
4. In the New Desktop Printer dialog, select "Translator (PostScript)" and click OK.
5. In the resulting dialog, click Create.
6. Type a name for your new desktop printer, such as "PostScript Translation," then click OK.
7. Quit Desktop Printer Utility.
8. Open the Classic application from which you wish to print. When you're ready to print, choose **Print** from the **File** menu.
9. In the resulting Print dialog, choose your new desktop printer ("PostScript Translator," or whatever you named it) from the pop-up menu, and click Save.
10. In the resulting dialog, give your file a name (or use the name that is provided automatically), select a location where the file will be easy to find later (such as your desktop), and click Save. (The file may take a moment to appear on the desktop or in a Finder window.)
11. To print the PostScript file, drop it on a desktop printer icon, or on the name of a printer in Printer Setup Utility. If you drop the file on the Printer Setup Utility icon in the Dock, it will be printed to the default printer.

Tip: You can view and print your new file from the Preview application, where advanced printing options, such as print quality and duplex settings, can be used.

Mac OS X 10.3.5 through 10.3.7: Slow application launch or delayed network activity

This article has been archived and is no longer updated by Apple.
After you install the Mac OS X 10.3.5, 10.3.6, or 10.3.7 Update, some applications may take longer to open (launch), and some network activities may exhibit unusual delays. This can affect:

- Finder
- iChat
- Mail
- Apple Remote Desktop

To resolve this issue, update to Mac OS X 10.3.8 or later.

If you called Apple technical support for assistance with this issue, and you were instructed to use the Terminal utility to modify your system, you can reverse those changes now (before or after updating). If you had to change your "hosts" file, reverse the change by typing this command in the Terminal and then pressing Return:

```
sudo mv /etc/hosts.org /etc/hosts
```

If you were instructed to make changes to your NetInfo database using the command `sudo nicl . create /config/lookupd/hosts Timeout 5`, reverse it by typing this command in the Terminal and then pressing Return:

```
sudo nicl . delete /config/lookupd
```

You must restart the computer after using either of these commands for the changes to take place.

iPhoto 5: Fixing blank, gray thumbnails

This article has been archived and is no longer updated by Apple.
Some iPhoto 5 users may experience an issue in which thumbnails appear as blank, gray images.

To resolve this issue, update to iPhoto 5.0.1 or later, and then rebuild your iPhoto Library. It's a good idea to make a backup copy of your iPhoto Library folder (located in your Pictures folder) before rebuilding it. To rebuild the library:

1. If iPhoto is open, quit it.
2. Hold down the Command and Option keys, and open iPhoto
3. iPhoto opens and rebuilds your library.

Display reverts to native resolution after restarting

This article has been archived and is no longer updated by Apple.

Have you ever restarted your computer and found that your display changed its resolution, making all the icons and menus smaller than before?

If you're using Mac OS X, 800 x 600 is the minimum recommended resolution for most displays. However, sometimes you may see that other resolutions, such as 600 x 400 or 800 x 500, are available when you're running Classic, playing certain games, or using some multimedia applications. If you set your display to use one of these resolutions, the computer will default back to the minimum 800 x 600 when you restart it.

iPod shuffle: Using AirPort Express to charge

This article has been archived and is no longer updated by Apple.
AirPort Express has a USB port for printer sharing, but it can also be used to charge your iPod shuffle. While this port was not intended for this purpose and it's not supported by Apple, iPod shuffle can be safely charged from an AirPort Express.

When an iPod shuffle is connected to AirPort Express, please note that its LEDs will flash orange, indicating that it is in disk mode, and that its front and back LEDs will not turn green when it's fully charged. To check the charge of iPod shuffle, disconnect it from AirPort Express and then press the battery indicator light.

iPod shuffle will not be able to play music while connected to the AirPort Express USB port.

iPod mini (Second Generation): Temporary delay in appearing in iTunes when large battery icon is visible

This article has been archived and is no longer updated by Apple.
If iPod mini (Second Generation) has little or no charge left, the following may occur when you connect it to the computer via USB:

- A large battery icon appears on the display for several minutes (this icon does not animate).

- Takes longer to appear in iTunes or on the Mac desktop or Windows' My Computer.
- Takes longer to appear in the iPod Software Updater.

Note: This delay can last up to five minutes until it regains enough battery charge to resume normal behavior while charging.

When the large battery icon appears, it signifies that the iPod mini (Second Generation) does not have enough charge to do anything but charge (it won't go into disk mode, display menus, or display any screen animation).

This won't happen if you connect via FireWire or to an iPod USB Power Adapter.

iPhoto 5 Frequently Asked Questions (FAQ): Working with slideshows

This article has been archived and is no longer updated by Apple.

Questions answered in this document:

1. I created a slideshow in an album (by clicking the slideshow button), but the next time I tried to view it, all the slideshow changes I made were gone! Where did they go?
2. What types of slideshows can I make in iPhoto?
3. Why does iPhoto display two Play buttons when I'm working on a slideshow?
4. Does the Ken Burns effect soften my photos?

See also:

iPhoto 5 FAQ: Working with RAW images
iPhoto 5 FAQ: Using the Adjust palette

Working with slideshows

1. **I created a slideshow in an album (by clicking the slideshow button), but the next time I tried to view it, all the slideshow changes I made were gone! Where did they go?**

   iPhoto 5 has two different kinds of slideshows, and you probably confused the old kind with the new one. (Don't worry, a few of us did that too.) Look at the bottom of your Source list (the column on the left side of the window). With iPhoto's new "cinematic" slideshow, all slideshows appear as their own entries in the Source list; you'll probably see that you've created more than one copy of your slideshow there. Each copy will still have the changes that you saved in it. Just pick the one you want to keep, and delete all the extras.

2. **What types of slideshows can I make in iPhoto?**

   You have two choices. In older versions of iPhoto, you could play an album as a slideshow, and the album could even retain slideshow settings. You can still do that, but you can also create an improved type of slideshow that exists on its own in the Source list. These highly customizable "cinematic" slideshows allow mixed transitions, varied slide durations, and the pan-zoom Ken Burns effect, for example.

   When you click the Slideshow button, iPhoto creates one of the new slideshows in the Source List, like "London Slideshow" in this picture.

   The old type of slideshow is still there too, but its control has moved. Select a regular album, then click the Play button at the bottom left corner of the iPhoto window. When you click this Play button, you'll get the older, familiar format.

3. **Why does iPhoto display two Play buttons when I'm working on a slideshow?**

   The round Play button only appears when you're editing a cinematic slideshow, and is used to control its playback. The rectangular Play button is used to play the old-style slideshows that don't appear in the Source list (you can ignore it when editing a cinematic slideshow).

4. **Does the Ken Burns effect soften my photos?**

   Because Ken Burns images are animated, iPhoto must scale them down to ensure reasonable performance on a range of computers. This will cause some images to look softer than they actually are, though the softening effect may not be noticeable on lower-resolution displays. For example, a landscape-oriented (horizontal) Ken Burns-effected image on an Apple 20-inch Cinema Display (1680 pixels wide) would be downsampled to an animation texture of about 1024 pixels, and then rescaled to fill the screen. This should be more noticeable than if you were viewing the slideshow on a display that was only 1024 pixels wide.

iPhoto 5: Using the RAW image format

This article has been archived and is no longer updated by Apple.
Images captured in RAW format allow for greater image quality and editing flexibility when you bring them into an image editor, such as iPhoto. RAW is like having insurance against your shooting mistakes—your camera settings are saved separately from the image data.

RAW files are comprised of raw image data and metadata that contains all of your camera settings you used to take the picture. When you shoot RAW, your camera retains (in theory) all of the light information that strikes its sensor (CCD or CMOS) in an "as-is" state, and then stores the file, along with the camera settings information, in a lossless compression format. Basically, your selected color profile and color balance settings don't matter; you can simply change them retroactively on your computer because the RAW file saved all the relevant data.

iPhoto uses the 16-bit RAW data to facilitate your edits before converting the RAW file to JPEG. This gives you greater editing flexibility since the RAW image's superior exposure latitude is retained. (An image's "exposure latitude" refers to how far you can adjust the exposure or white balance while still retaining acceptable quality.)

When you shoot straight to JPEG, your camera looks at your white balance and color profile settings, then discards all information that is not required to make a JPEG of your selected grade with those color settings when it produces the image.

Because information is discarded, a JPEG has less latitude for retroactive correction than a RAW file does. Say, for example, that you had your camera set to ISO 400 when it should have been set to ISO 1000; your exposure will be underexposed (it'll come out too dark). That's not a big problem if you captured a RAW image because you can just bump the exposure a stop and a half without worrying too much about image degradation. With a JPEG image, you'd have less color information to work with, so loss of image quality will factor into play.

The flexibility of RAW shines most when you wind up with a really bad exposure. Take, for example, this overexposed picture of Sidekick, the lounging brown tabby. While the camera exposed the back of the play tunnel correctly, our intended subject is looking pretty washed out.

In fact, the lighting in this exposure is so uneven that we can't make it uniformly perfect in iPhoto, so we'll just concentrate on making Sidekick look as good as possible instead of trying to perfect her play tunnel too. To demonstrate how RAW and JPEG photos react differently, we applied the exact same adjustments (shown on the right) to both images.

Here's Sidekick after we applied the adjustments to the original RAW image:

And here she is again after we made the adjustments to a JPEG:

Note how the color, contrast, and detail in Sidekick's fur remain at a higher quality in the RAW version than in the JPEG image. In this particular case, the front of the tunnel below Sidekick is a bit bright, but remember that our goal was to make her look good.

iPhoto 5 or later: Using Tint, Temperature, and advanced color concepts

This article has been archived and is no longer updated by Apple.

Using Tint and Temperature

The Tint and Temperature controls go hand-in-hand with the fundamental concepts for light and photography. And luckily, they're not hard to learn. To use these controls effectively, all you need to know is what impact each has on the classic lighting issues each was built to address.

In a nutshell, the Tint slider lets you control the amount of red or green tones in your image (just like the Tint control on your TV). Move the slider to the left to add more red and lessen the amount of green. Move it toward the right to add more green and lessen the amount of red. This slider comes in handy when you're trying to make skin tones look good, want to balance out scenery that contains a lot of plants, or forgot to use your camera's fluorescent white balance setting.

The Temperature slider is kind of like a "white balance" corrector in that it allows you to introduce more warmth (more orange tones) or coldness (more blue tones) to an image. For example, if you shot an image using the camera's Auto white balance and your prized polar bear picture is looking mighty blue, move the Temperature slider to the right to warm up the image, or you can move it left to give the image even more of an Arctic chill.

Advanced color concepts

Have you ever taken a picture in a room lit by fluorescent light and sunlight pouring in through an open window, and then your flash went off too? You might notice that the color in the resulting image looks a little funny. This is because each one of those lighting sources emphasizes a different color in the visible light spectrum (like the colors in a rainbow), and they're all mixed up in your photo. iPhoto's Temperature and Tint sliders allow you to correct for that.

To see how this works first hand, change the white balance setting on your camera from Auto to Daylight. Then get a sheet of white paper, and take a picture of it in each of these conditions:

a. Outdoors on a clear day at mid-afternoon
b. Indoors with no lighting, using the flash
c. Indoors with an incandescent (tungsten) light bulb only
d. Indoors with a fluorescent light bulb only

Once you download the pictures to your computer, you should see these results:

a. Mid-afternoon sunlight: The paper looks white. This lighting condition is what's considered a "neutral" color temperature.
b. Flash only: The paper looks a little blue. Flash photography generally produces "cold" temperature light.
c. Tungsten bulb: The paper looks orangey-yellow. This is "warm" temperature lighting.
d. Fluorescent: These vary the most. In addition to looking a little warm or cold, they may also have a green or purple tint.

Tungsten, sunlight, and flash are all light sources that represent a full light spectrum, but with emphasis at different points. Because the spectrum is complete and continuous, you can move iPhoto's Temperature slider to remove a warm or cold cast, revealing the full range of color underneath.

However, most fluorescent lights, as well as certain types of outdoor lighting, have gaps in the light spectrum they emit. This is why images taken under these types of lights can't be color corrected effectively using the Temperature slider, which only works its magic on the warm-cold continuum. However, moving the Tint slider can remove a green or purple cast from the fluorescent light. But because the fluorescent spectrum is incomplete, a Tint correction generally can't achieve the look of natural light in the way that a temperature correction can, because certain colors are missing from the light, and you can't reveal what's not there. For this reason, it often helps to mix flash with fluorescent light, to round out the spectrum.

Sudden Motion Sensor and video editing performance

This article has been archived and is no longer updated by Apple.
Beginning with the PowerBook G4 (12-inch 1.5GHz), PowerBook G4 (15-inch 1.67/1.5GHz), and PowerBook G4 (17-inch 1.67GHz), PowerBook G4 computers feature a Sudden Motion Sensor.

If you have a computer with the Sudden Motion Sensor and you have video editing applications, such as Final Cut Pro, Final Cut Express, or iMovie that exhibit performance issues (like dropped frames), then temporarily turn off the Sudden Motion Sensor while working in those applications.

Mac OS X Server 10.3.7: Setup Assistant asks for Disk 2 after installation

This article has been archived and is no longer updated by Apple.
When installing Mac OS X Server 10.3.7 from the Installation DVD that ships with the Xserve G5, the Server Assistant may prompt you to insert "Disk 2." This message is erroneous. There is no second disc.

After the Assistant ejects the Installation DVD and prompts you to install Disk 2, simply reinsert the Installation DVD to continue.

iLife ‘05: Alert when installing from CD

This article has been archived and is no longer updated by Apple.

When you try to open the iLife '05 installer on the iLife '05 Install CD, you may see an alert that says the computer contains a DVD drive, and that you must install iLife from the install DVD.

If you know you have a CD-ROM drive, then just click Continue. If you're not sure what drive you have, you can check Apple System Profiler or you can just try putting the DVD disc in. If it automatically ejects after a moment, then you don't have a DVD-ROM drive and you should use the CD to install and click Continue if the alert appears again.

Mac OS X 10.3.8: Free disk space disappears after updating to 10.3.8

This article has been archived and is no longer updated by Apple.
After updating to Mac OS X 10.3.8, free disk space may slowly "disappear" if a certain third-party gaming device driver is installed.

This issue can occur when the Macally iShock game controller device driver (used for devices such as the iShockII) is installed, but the device isn't connected. The "missing" disk space is actually being filled by one or more system.log files that are recording iShock driver issues.

To resolve this issue, first check out Macally's Drivers webpage and read the section, "Attention: iShock/iShockII users and Panther OS 10.3.8 update," which tells you how to remove iShock drivers that can cause this issue, as well as how to install newer drivers that avoid this issue.

Once you've removed the old driver and installed the newer one, reclaim the missing disk space by deleting system.log files:

1. Open Terminal (/Applications/Utilities/Terminal)
2. Type this command at the prompt:

```
sudo sh -c "echo > /var/log/system.log"
```

3. Press Return. Enter the admin password if prompted.

Tip: If removing the system.log file does not restore all the missing disk space, delete the archived system log files; for example, system.log.X.gz (where X is a number). These files are also stored in /var/log. You can access the files from the Finder.

1. From the Finder **Go** menu, choose **Go to Folder**.
2. In the "Go to this folder" field, type: `/var/log`
3. Delete any large system.log.X.gz files.

Mac OS X 10.4: Using Spotlight to search disk images or archives

This article has been archived and is no longer updated by Apple.

Mac OS X 10.4 Tiger features Spotlight, which you can use to quickly find information on your computer.

If you want to search a disk image's contents with Spotlight, just remember this tip: The image needs to be mounted. If it's not mounted, Spotlight can tell you where the image itself is located, but not what's on it. Double-click the image file to mount it and make it available to the system.

To search an archive with Spotlight, such as a .zip file you created in the Finder or other file compression utility, open (uncompress, expand) the file first.

Logic Pro, Logic Express: Unable to bounce QuickTime Music Synthesizer tracks

This article has been archived and is no longer updated by Apple.
If you have tracks that trigger the internal QuickTime Music Synthesizer in a Logic project and then select them as part of a bounce, these tracks will not be included in the audio output. This is because it's not possible to directly bounce the audio output from the QuickTime Music Synthesizer within a Logic Pro or Logic Express session.

As a workaround, assign the affected track to the AU-Audio Instrument DLSMusicDevice. This uses the same QuickTime synthesizer, including the ability to listen to program changes. Like any Audio Instrument, you can bounce it both realtime and offline.

Additional information
The reason this doesn't work the way you might expect is because Logic's audio engine is not actually processing QuickTime synth tracks. Instead, Logic sends MIDI data to QuickTime, and QuickTime handles the audio in parallel with Logic. Thus the tracks are not part of the bounced file.

Logic Pro and Logic Express 7: How to create an Autoload Song template file

This article has been archived and is no longer updated by Apple.
In earlier versions of Logic, if you saved a file named Autoload in the same directory as the Logic application, that file would be used as the default song template whenever you launched Logic or created a new song. You can still use this method in Logic Pro and Logic Express 7, but the location for storing your Autoload template has changed.

With Logic's expanded Templates feature, you can create an unlimited number of templates. To create an Autoload Song:

1. Open an existing song file that you'd like to use as the default template, or create a new one and configure it to your needs.
2. Choose File > Save As Template.
3. In the resulting dialog, type Autoload in the Save As field.
4. Make sure that the Song Templates folder appears as the chosen location from the Where pop-up menu (the default setting).
5. Click Save.

The template will be saved to ~/Library/Application Support/Logic/Templates. Any templates you create should be saved to this location.

Notes:

- When you create a new song and do not select the "Use template" checkbox in the New dialog, or if you select the checkbox but fail to specify a particular template, the Autoload Song will be used.
- If you have Logic's global preferences set to "Automatically load most recent song at startup," the Autoload Song will not load when you launch Logic. However, it will load whenever you create a new song.

Logic Pro: Using multiple outputs with Ultrabeat

This article has been archived and is no longer updated by Apple.
Logic Pro can route audio from various software instruments to different destinations. This allows you to process different voices of the same instrument with independent DSP plug-ins, or to route different streams of audio to different outputs on your audio hardware.

Logic's integrated drum machine, Ultrabeat, is one instrument that can greatly benefit from this feature, allowing you to process each drum voice (kick drum, snare, toms, cymbals, and other percussive sounds) within a kit individually. Here's how to set up Ultrabeat to use multiple outs:

1. In the Arrange window, select an Audio Instrument track that you want to use.
2. In the channel strip pane (on the left side of the Arrange window), insert the Ultrabeat plug-in as an input: Click the slot directly below I/O and from the pop-up menus, choose **Multi Channel > Logic > Ultrabeat**.

3. The Ultrabeat interface opens, listing its 25 drum voices on the left side.
4. Load the kit that you want to use before proceeding. Initially, all sounds are routed to the Main output pair, Output 1-2, as dictated in the Audio Instrument channel strip (the assigned output pair appears in the slot directly below the Ultrabeat insert).
5. To select a different destination for a drum sound, select the voice in the Ultrabeat interface and click its output destination. A pop-up menu opens, allowing you to choose from seven additional stereo outputs. Choose one.

6. Repeat this process for each drum sound that you would like to send to a different destination than the Main output. In the picture above, we routed a Kick drum to Output 3-4.
7. When you're done assigning outputs, open the Track Mixer window.
8. Click the Global button in the upper left corner, and then click the Aux button a few buttons below it. (Logic Pro uses auxiliary channels as routing destinations for multichannel instruments.)
9. Click the input slot (the slot below I/O) for Aux 1; a pop-up menu opens. Besides the usual Input and Bus source submenus, the menu now has an instrument channel submenu for assigning Ultrabeat's multiple channels.

10. From the Instrument submenu, choose which output stream you would like the Aux channel to use as its input source. If the Aux channel is set to mono, then the streams will appear as individual channels (such as Ultrabeat 3, Ultrabeat 4). If the Aux channel is set to stereo, then the the streams will appear as pairs (such as Ultrabeat 3-4, Ultrabeat 5-6, and so on). In our example, we set Aux 1 to accept input from Ultrabeat 3-4. Therefore, any Ultrabeat voice that we assigned to Output 3-4 (such as the Kick drum), can now be processed on the Aux 1 channel.
11. Repeat as necessary to assign more Aux channels to support the number of output pairs that you have coming from Ultrabeat.

You can insert plug-ins on the Aux channel, use Sends, and so forth. If your audio interface offers more than two outputs, you can even route the Aux to different physical outputs for external processing.

Note: After using the Logic Setup Assistant, you may only have two Aux channels. Please see the Logic manual for information on setting up additional Aux channels. As a shortcut, you can make a new song using the Basic Production template, which starts out with eight Aux channels.

Keynote 2: Printing to a network PostScript printer takes a long time

This article has been archived and is no longer updated by Apple.

When you print a Keynote 2 file to a network PostScript printer, it may take an unusually long time to print. This printing delay only occurs with Keynote 2 documents that contain objects with an alpha transparency of less than 100 percent opacity on computers using Mac OS 10.3.6 through Mac OS 10.3.8.

This issue does not occur with printers that are connected directly to a computer through USB.

Published Date: Oct 10, 2016

Windows Printing doesn‘t work after Windows password is changed (Mac OS X 10.3, 10.4 or later)

This article has been archived and is no longer updated by Apple.

In Mac OS X 10.3 or later, when using Printer Setup Utility to add a printer shared by a Windows PC, a dialog box appears, requesting you to enter the username and password of a Windows user who has access to the printer. This username and password is used each time a document is printed to the printer, making all print jobs coming from this computer appear to be generated by the same Windows user, regardless of which *Mac OS X user* is actually printing.

However, if the Windows user's password is changed on the PC, printing will fail because Mac OS X is still trying to use the old password. When this happens, the Mac OS X printer status will display the message, "ERROR: Connection failed with error NT_STATUS_LOGON_FAILURE."

Solution

Delete the printer in Printer Setup Utility, and then add it again with the updated password.

This document will be updated as more information becomes available.

Mac OS X‘s Shut Down schedule will only work when one user is logged in

This article has been archived and is no longer updated by Apple.

With Mac OS X 10.3 or later, if no user is logged in, or if more than one user is logged in at the same time, the computer cannot shut down automatically at a time specified in Energy Saver Schedule preferences.

If you want to schedule your computer to Shut Down automatically at a scheduled time, be sure that one—and only one—user is logged in.

Mac OS X 10.4 tip: Update to Mac OS X 10.4.6 or later to allow the computer to shut down at the scheduled time while at the login window.

Check out Mac OS X 10.3 and later: Computer must be awake for scheduled shutdown to occur, too.

Logic Pro and Logic Express 7: PlatinumVerb Mix level is not 100 percent

This article has been archived and is no longer updated by Apple.
In Logic Pro and Logic Express 7.0 and later, PlatinumVerb will play below the indicated Mix level whenever you insert it in a bus. Though the PlatinumVerb interface shows a Mix level of 100 percent, it actually plays at about 20 percent. This affects every instance of PlatinumVerb that you insert in a bus.

To resolve this issue, move the Mix level fader down a bit, and then bring it back to 100 percent.

This document will be updated as more information becomes available.

Certain versions of Mac OS X may cause iPod mini (Second Generation) to not be recognized on USB

This article has been archived and is no longer updated by Apple.
iPod mini (Second Generation) can be connected to a high-power USB port, but it requires Mac OS X 10.2.8 or Mac OS X 10.3.4 or later. Using other versions of Mac OS X may cause iPod mini (Second Generation) to not be recognized in the Finder or iTunes via USB.

If you're using Mac OS X 10.3 through 10.3.3:
Update to 10.3.4 or later (the update is available from Apple Downloads or through Software Update). Make sure you are also using iTunes 4.7 or later.

If you're using Mac OS X 10.2.7 and earlier:
To connect iPod mini (Second Generation) over USB, you must update (or upgrade) to Mac OS X 10.2.8 (the update is available from Apple Downloads or through Software Update). You must also install the software from the included CD. Make sure you are using iTunes 4.7 or later.

If you don't update your OS to a required version of Mac OS X, you won't be able to use the iPod mini (Second Generation) over USB. Without an update to the OS, you can use FireWire instead of USB to connect and sync, using the optional iPod Dock Connector to FireWire cable.

Final Cut Express HD does not support the use of mixed media formats on tape

This article has been archived and is no longer updated by Apple.

Capturing footage from a tape that has had a different format previously recorded on it will not work in Final Cut Express HD.

For example, if you previously recorded a project onto a tape using a 720p30 format camera, you shouldn't use a 1080i60 format camera to record over the footage on that same tape (or vice versa). Likewise, a tape that you previously used with a DV-NTSC camera should not be used again with an HDV camera.

If you do try to capture footage from such a tape, you may experience the following issues in Final Cut Express HD:

- Frame stalls
- Frame freezes
- Dropped frames

You can reuse a tape (despite its format history) without issue if you have a way to "black and code" or stripe the tape with the format you want to use (Final Cut Express does not offer a way to do this).

Logic Pro, Logic Express: Error -40 when bouncing a session or freezing a track

This article has been archived and is no longer updated by Apple.
Sometimes when you try to freeze a track or bounce a session in Logic, a dialog appears with this alert message:

> Attempt to position before start of file. Result code = -40

Logic has a maximum audio file size of 2 GB when freezing tracks or bouncing sessions. If the file to be created by the bounce or freeze operation will exceed that size, you will get this error message. In practical terms, this will only occur with very long sessions or tracks.

The actual time limit is determined by the bit depth and sample rate in use. Frozen tracks are always stored as 32-bit audio files; at a sample rate of 44.1 kHz, mono files require approximately 10 MB per minute, and stereo tracks require about 20 MB/minute. With this in mind, if you have a 44.1 kHz project and plan on freezing tracks, the time length limitation is about 200 minutes for mono tracks and 100 minutes for stereo. At higher sample rates, the time limit is reduced proportionately. For example, at 88.2 kHz, the track time limit will be half as long.

When bouncing a session to a stereo file, the time limit depends on both the sample rate and bit depth selected for the bounce. A 16-bit, 44.1 kHz stereo file requires approximately 10 MB/minute; therefore, the time limit for a bounced file in this format is about 202 minutes. If the bounce is set to 24-bit/44.1 kHz, then the time limit will be about 134 minutes. Increasing the sample rate, of course, reduces the available time.

When bouncing tracks, you can effectively double the available maximum time by setting the Stereo File Type in the Bounce Output dialog to Split (L+R). In this format, Logic writes a separate mono file for each stereo channel. Each of these files can be up to 2 GB in size; therefore, the total of the left and right channels can now be up to 4 GB.

Logic Pro, Logic Express: Instrument not triggered as expected

This article has been archived and is no longer updated by Apple.
Sometimes you won't be able to trigger an instrument on an Audio Instrument or MIDI track as expected. This can happen if you inadvertently disable the Record-Enable button on the selected track. (Normally, a track's Record-Enable button will be enabled when you select the track.)

In order to monitor Audio Unit instruments, MIDI instruments, or incoming signals, this button must be turned on. When turned on, the button will be red.

When the button is turned off (it appears gray) on a selected Audio Instrument track, then incoming MIDI from your controller will not be able to trigger the instrument. You will, however, be able to hear anything that's already recorded on the track during playback.

To resolve the issue, simply reactivate the button as shown above.

Logic Pro 7: Changing the Record Path for DAE Channels 33 and Higher

This article has been archived and is no longer updated by Apple.

When using DAE, the Recording Path setting in the Set Audio Record Path window only applies to tracks 1 through 32. If a higher track is record-enabled, a dialog opens, asking you to set another record path for the higher numbered tracks. If you accidentally set it to an undesired location, or you need to change it later, you cannot change the path in the Set Audio Record Path window.

Instead, re-initialize the record path from the Audio Configuration window:

1. Open the window by choosing **Audio > Audio Configuration** in the Logic Pro main menu.
2. Choose **Device > DAE** in the Audio Configuration window.
3. Choose **Edit > Remove Record Path**.

This will re-initialize the record path for all DAE channels. You can then set channels 1 to 32 the usual way by choosing **Audio > Set Audio Record Path**. To set the record path for channels 33 and higher, just record-enable one of the tracks to open the dialog that lets you set another record path for the higher channels.

This is not an issue when using Core Audio. The Recording Path setting applies to all channels, and can be freely reset.

Published Date: Feb 20, 2012

GarageBand: High audio levels can cause distortion

This article has been archived and is no longer updated by Apple.
When recording audio in GarageBand, you may get distortion if your audio levels are too high (or "hot" in audio engineering parlance). This can be caused by one or more of the following instances:

- The audio source volume is set too high.
- The audio interface's gain level or output level is set too high.
- The Input volume in Sound preferences is set too high.
- The track or master volume level in GarageBand is set too high.

If you hear distortion in one of your Real Instrument tracks, play your sound while doing the following steps until you no longer hear distortion.

1. Listen to your source (the instrument or thing that you're recording). If it sounds distorted outside of your computer, turn down its volume until the distortion stops. If your source sounds fine, keep reading.
2. Check your audio interface—if you're not using an audio interface, skip to step 3. Depending on your device, you may have two areas to control volume—the input and the output gain. Adjust your level or levels accordingly, making sure that the meters on your device show a strong signal without signal peaks (if you see red lights on any level meter, turn down that gain level just until the red stops lighting). If you're still getting distortion, read on.
3. Check the Input level in the computer's Sound preference pane. Set the "Input volume" slider so that the input level meter shows a strong signal without lighting up the last meter light. Still hear distortion? Then keep reading.
4. In GarageBand, move the volume slider on the affected track to the point where you get a strong signal but the clipping indicators (the tiny dots to the right of the level meters) do not light. Check the master volume too—if the clipping indicators light up, turn down the volume level just until they no longer light. This should resolve the issue.

Logic Pro: Using multiple outputs with EXS24

This article has been archived and is no longer updated by Apple.
Logic Pro can route audio from various software instruments to different destinations. This allows you to process different voices of the same instrument with independent DSP plug-ins, or to route different streams of audio to different outputs on your audio hardware.

The Logic Pro integrated software sampler, EXS24, is one instrument that can greatly benefit from this feature, allowing you to process sampler instrument groups individually. Here's how to set up EXS24 to use multiple outs:

1. In the Arrange window, select an Audio Instrument track that you want to use.
2. In the channel strip pane (on the left side of the Arrange window), insert the EXS24 plug-in as an input: Click the slot directly below I/O and from the pop-up menus, choose **Multi Channel > Logic > EXS24**

3. The EXS24 instrument interface opens. Though you can configure the EXS24 to have multiple outputs for various instruments, one of the most common uses for this feature is to configure a drum kit that allows you to independently process and control the kit's individual drum elements. Let's take an existing drum kit and set it up for multiple output.

4. From the instrument selection menu, choose **Factory > 08 Drum Kits > Rock Kit**. This loads the rock drum kit that is included with the Logic Pro 7 installation.
5. To the right of the instrument selection, click the Edit button.

The EXS24 Instrument Editor opens.

The zones that appear along the left side of the window define which samples are triggered by MIDI notes. These zones are then assigned to the groups that make up each instrument sound, shown on the right side of the window.

6. Click the disclosure triangle for the group BD02 to reveal the group settings for the bass drum sound. By default, all groups are assigned to the Main output pair, Output 1-2, as dictated in the Audio Instrument channel strip (the assigned output pair appears in the slot directly below the EXS24 insert). Note: If the EXS Output is not displayed, select the option **View > Group: EXS Outputs. Alternatively you may want to select View > View All.**
7. **To change this setting, click the current EXS Output for the group and select another output from the pop-up menu. In our example, we routed the bass drum sound to the output pair 3-4.**

You can assign a group to any of the single outputs or output pairs you like. Repeat with all other groups.

8. **When you're satisfied with the assignments, save the instrument by choosing Instrument > Save from the EXS24 Instrument Editor window.**
9. **Close the EXS editor window and open the Track Mixer window.**
10. **Click the Global button in the upper left corner, and then click the Aux button a few buttons below it. (Logic Pro uses auxiliary channels as routing destinations for multichannel instruments.)**
11. **Click the input slot (the slot below I/O) for Aux 1; a pop-up menu opens. Besides the usual Input and Bus source submenus, the menu now has an instrument channel submenu for assigning the EXS24's multiple channels.**

12. From the Instrument submenu, choose which output stream you would like the Aux channel to use as its input source. If the Aux channel is set to mono, then the streams will appear as individual channels (such as EXS24 3, EXS24 4). If the Aux channel is set to stereo, then the the streams will appear as pairs (such as EXS24 3-4, EXS24 5-6, and so on). In our example, we set Aux 1 to accept input from EXS24 3-4. Therefore, any EXS24 voice that we assigned to output 3-4 (such as the bass drum), can now be processed on the Aux 1 channel.
13. Repeat as necessary to assign more Aux channels to support the number of outputs that you have coming from the EXS24. Note that EXS outputs that are assigned to Aux channels are automatically removed from the EXS's Main output.

You can now use any Aux channel to process the EXS24 stream in any way you like. You can insert plug-ins, use Sends, and so forth. If your audio interface offers more than two outputs, you can route the Aux channel to different physical outputs for external processing.

GarageBand 2.0: Notes may stick when you partially extend or trim a MIDI Software Instrument loop

This article has been archived and is no longer updated by Apple.
In some cases, when you partially extend or trim a MIDI loop in GarageBand, some notes may *stick* (play continuously instead of stopping when they should) on playback. This can happen if the loop contains a sustain pedal effect, which allows notes to sound a bit longer when the effect is employed, such as in a piano loop. This can affect both prerecorded and self-recorded Software Instrument loops.

Loops that contain sustain pedal events use "on" and "off" messages to control when the sustain pedal is used. When a sustain pedal "on" message is sent, all subsequent notes will be prolonged until a sustain pedal "off" message is sent.

However, if you shorten or extend a loop to the point where the sustain "on" message is included but the following sustain "off" message will not play, some notes may stick. The severity of the issue depends on whether the instrument in use has a natural decay (such as with a drum or other percussive instrument loop) or a sound that has the potential to be sustained almost infinitely (such as with string loops or other bowed or blown sounds).

If you need to partially extend or trim a loop, try this workaround:

1. To extend a loop, hold down the Option key (this will make a copy of the loop) and drag the loop to the right of the original. To trim a loop, start at step 2.
2. Select the copied region (if extending) or the original (if trimming), and open the region editor by clicking the Editor (scissors) button or double-clicking the region.
3. If the Advanced pane in the editor isn't displayed, click the disclosure triangle on the right side of the Region header.
4. In the Advanced pane, from the top pop-up menu, choose **Sustain**.
5. Locate the needed sustain "off" event, and move it to the left so that it occurs before the point at which you want the loop to end. (You can press Play to watch the playhead move across the events to get a visual idea of where to move it.) This picture shows a sustain event that has had its sustain "off" message trimmed away--it needs to be corrected:

   This image shows a proper sustain event:

6. In the timeline, drag the bottom right corner of the region to the left to the desired length.

iLife ‘05: How to custom install applications

This article has been archived and is no longer updated by Apple.

If you don't want to install the entire iLife '05 package, you can custom install one or more applications from the iLife CD or DVD. Here's how:

1. Launch the installer on your iLife '05 CD or DVD and click the Customize button on the last pane of the installer.
2. The installer displays a list of items that can be installed individually from the package. Select only the items you want to install.
3. Click Install to install your selected items.

If you're trying to reinstall an application but it appears dimmed in the custom install list, quit the installer, delete the item from the Applications folder, and delete its associated receipt files from /Library/Receipts/. Then reopen the iLife installer and try custom installing again.

Important: After installation is complete, immediately use Software Update to make sure that all the applications are up to date before you launch them.

.Mac: iDisk folder and file names that contain non-Roman characters may appear as gibberish

This article has been archived and is no longer updated by Apple.

If you use Goliath to upload files or folders that contain non-Roman characters in their names to your iDisk, the names may appear as gibberish.

This can happen if you use the following languages:

- Chinese Simplified
- Chinese Traditional
- Korean
- Japanese
- Russian

Note: There may be additional languages that are also affected by this issue.

For now, please rename any affected files or folders on your iDisk manually.

This article will be updated as more information becomes available.

iMovie HD, iDVD 5: White frames appear at chapter markers in some DVD slideshows

This article has been archived and is no longer updated by Apple.

If you create a slideshow movie in iMovie HD containing chapter markers it may produce white frames when burned to DVD using iDVD 5.

As a workaround, follow these steps:

1. In iMovie HD, add your images and transitions as desired.
2. Export to a Full Quality QuickTime movie.
3. Import that movie into a new iMovie HD Project.
4. Add chapter markers in the iDVD pane.
5. Export to iDVD and burn your disc as usual.

This document will be updated as more information becomes available.

iPhoto: Book orders may get canceled if books contain Type 1 PostScript fonts

This article has been archived and is no longer updated by Apple.
If you create a book in iPhoto using certain Type 1 PostScript fonts, your book order might get inadvertently canceled. For now, you can get your book back on track by changing the font to one that isn't Type 1 PostScript, and then resubmitting your book order.

So how can you tell which fonts are Type 1 PostScript?

There's a couple of different ways. If you're using Mac OS X 10.3, use Font Book. If not, you can find this information in the Info or Inspector window in the Finder.

Using Font Book

1. Open Font Book (in the Applications folder).
2. Be sure that both the Preview and Font Info panes are displayed. If Font Book opens without the Preview pane visible, it looks like this:

   To display the Preview pane, from the **Preview** menu, choose **Show Preview**.

   If you don't see any "Font type" or font "Family" information at the bottom of the Preview pane, from the **Preview** menu, choose **Show Font Info** to display the Font Info pane.

3. Select the font that you want to use in your book from the Collection and Font columns. The font type will be clearly displayed in the Font Info pane (next to the words "Font type"), like this:

4. Make sure that the font you've chosen is not a Type 1 PostScript font.

Using the Finder

Though you could open an Info window for every font you're interested in using, the Inspector is more convenient, since you'll only have to open it once.

1. Click the Finder icon in the Dock.
2. While holding down the Option key, choose **Show Inspector** from the **File** menu (or just press Command-Option-I).
3. Open a Finder window and navigate to the Fonts folder that contains fonts you want to use. Remember that Mac OS X uses several Fonts folders for different purposes.
4. Select a font in your chosen Fonts folder, then look at the Inspector window that you opened earlier (it updates its information for each new item that you click). It will display the font name and type, like this:

5. Make sure that the font "Kind" is not Type 1 PostScript.

Tip: Make sure that you select only one font at a time. A dash (-) appears in all Font Info fields if you select more than one font.

iDVD 5.0: Settings pane is blank

This article has been archived and is no longer updated by Apple.

When you attempt to customize your iDVD project, sometimes the Settings pane (the place where you customize backgrounds, text, and buttons) may not load properly. This can happen if Multiple Master (MM) fonts are installed on your system. MM fonts are an extension to the Adobe PostScript font format.

Update to iDVD 5.0.1 or later.

Mac OS X Server 10.2: Protecting your Windows (SMB) shares from remote attacks

This article has been archived and is no longer updated by Apple.
On Mac OS X Server versions 10.2 to 10.2.8, a remote attacker may be able to gain access to files that exist outside of an SMB share's defined path. The attacker must still be using an account that has read permissions for the targeted files.

To prevent this scenario, locate your smb.conf file, and open it in the text editor of your choice. Search the file for the entry, `wide links = yes`. If it's present, change the `yes` to `no`. If the line isn't present, add the following line to the file:

```
wide links = no.
```

Mac OS X and Mac OS X Server 10.3: Copying files over network may result in incorrect locked file messages

This article has been archived and is no longer updated by Apple.
Sometimes you might get a message that says a file is "locked," even though the Info window clearly indicates that the file isn't. This can be the result of file permissions.

This can happen when you copy a file to your computer over a network, using protocols such as AFP (Apple File Service or Personal File Sharing) or SMB (Windows file sharing), from a share point to which you have read-only access. The "locked" message may appear if you try to save changes to the file in certain applications, though it may work normally in others.

To resolve the issue, use the Info window to give yourself read-write permissions to the affected file or files.

1. If only one file is affected, select it in the Finder. If multiple files are affected, put them in a new folder and select the folder.
2. From the **File** menu, choose **Get Info**.
3. In the Info window, click the disclosure triangle next to Ownership & Permissions.
4. From the **You can** pop-up menu, choose **Read & Write**. (You may be asked to enter an administrator password.)
5. If you selected a folder, click the Details disclosure triangle and then click the "Apply to enclosed items" button.
6. Close the Info window.

About Security Update 2005-002

This article has been archived and is no longer updated by Apple.
This document describes Security Update 2005-002, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How To Use The Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Security Update 2005-002

Available for: Java 1.4.2
CVE-ID: CAN-2004-1029
Impact: Updates Java to address an issue where an untrusted applet could gain elevated privileges and potentially execute arbitrary code.
Description: A vulnerability in the Java Plug-in may allow an untrusted applet to escalate privileges, through JavaScript calling into Java code, including reading and writing files with the privileges of the user running the applet. Credit to Sun for reporting the issue, and to Dino Dai Zovi for assisting us in the analysis.

Available for: Java 1.4.2
CVE-ID: CAN-2005-0418
Impact: Updates Java to address an issue in Java Web Start that allows an untrusted application to elevate its privileges
Description: A vulnerability in Java Web Start allows an untrusted application to elevate its privileges. For example an application may grant itself permissions to read and write local files or execute local applications that are accessible to the user running the Java Web Start application. Releases prior to Java 1.4.2 are not affected by this vulnerability.

Logic Pro, Logic Express: Logic unexpectedly quits when you try to scroll

This article has been archived and is no longer updated by Apple.
Sometimes Logic unexpectedly quits when you try to use a scrollbar. This may be due to a compatibility issue with version 5.0 of WaveShell (a third-party product) for Audio Units.

Waves has released a 5.01 update, which resolves this issue. You can get the updated version from the Waves website.

Note: After updating the WaveShell, Logic will rescan your installed Audio Units the next time it is launched. This will take several minutes.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

PowerBook G4 sound balance

This article has been archived and is no longer updated by Apple.
The 15-inch "aluminum" PowerBook G4 computers, starting with the PowerBook G4 (15-inch FW 800), have a midrange-enhancing speaker that's designed to produce a separate channel of midrange sound. The midrange speaker is located underneath and to the left of the space bar. The location of the three speakers is indicated by circles in the picture below.

There are no settings in the Sound pane of System Preferences to adjust the midrange speaker independently. Increasing and decreasing the system volume changes both the stereo speakers and the midrange speaker at the same time.

You may notice that when you move the Balance slider in Sound preferences far to the right, you can still hear sound coming from what you may perceive as the left speaker. In reality, the sound is coming from the midrange-enhancing third speaker, but because of its placement, the audio appears to be coming from the left side. This is normal.

How Finder lists items that are sorted by name (Mac OS X)

This article has been archived and is no longer updated by Apple.

Finder lets you sort your files and folders in windows in all kinds of ways—by name, by date modified, by size, and so forth. But have you ever wondered how Finder decides to organize these items when you view a window as a list by name (beyond alphabetizing them)?

In a nutshell, Finder uses these guidelines when it sorts names:

- The character letter case in a file or folder's name doesn't matter. Finder treats "AAA" the same as "aaa"—in fact, you can't even have two items in the same folder with those names. Files or folders that have names in all capital letters aren't sorted before or after similarly-named items with only lowercase letters.

- Punctuation and symbols are very significant for sorting. Usually, if a file or folder's name begins with a punctuation mark (such as "_" or "~" or "!"), it will appear before all other items when sorting by name (or at the end when reverse sorting by name). **Tip**: If you want certain files or folders to always appear first (at the top) in a view-by-name Finder window, put one or two punctuation marks before the name, such as "__BestPhotoEver.jpg."

- Finder treats whole numbers numerically instead of by single digit, so "1 2 10" would come before "1 10 2," but if you take away the spaces, "1210" would come after "1102." Also, Finder does not sort according to the fractional parts of numbers. Any digits that appear after a decimal point are sorted as a different number.

Taking these guidelines into consideration, if you had items named aaa, 111, zzz, _zzz, 11 10, 1110, and a0 in a window, Finder would sort their names as follows in a window viewed as a list:

- _zzz
- 11 10
- 111
- 1110
- a0
- aaa
- zzz

Note: If you select all these items in the Finder window (Command-A), copy their names to the Clipboard (Command-C), and then paste them into a text document (or email), they will appear in a slightly different order.

Mac OS X 10.4 Tiger adds options

In Mac OS X 10.4, you can select language-specific sort orders in the Finder (or elsewhere). Open International preferences and click Language. Drag languages into the order your prefer to use in application menus, dialogs, and sorting. You can also choose from the "Order for sorted lists" pop-up menu.

The Unicode standard

Technically speaking, Finder sorting is based on the Unicode Collation Algorithm, defined by the Unicode Consortium. This standard provides a complete and unambiguous sort ordering for all Unicode characters, and is available on the Unicode Consortium website. Other operating systems or applications may use different rules that can make the same list of items sort in a different way.

Xserve G5: About 2 GB DIMM Support

This article has been archived and is no longer updated by Apple.
Standard Xserve G5 systems support up to 8 GB of RAM, using 1 GB PC3200 ECC unbuffered, unregistered SDRAM DIMMs. However, in March 2005, Apple qualified a 2 GB DIMM for use with Xserve G5, allowing a system to now support up to 16 GB of RAM. This article provides more information about 2 GB DIMM support for Xserve G5 and the related issues.

About the 2 GB DIMM for Xserve G5

The 2 GB DIMM is offered as a configure-to-order option for Xserve G5. The DIMM is a special high-density design, engineered to be industry compatible and deliver 2 GB-per-DIMM capacity at full PC3200 performance. The DIMM supports error correction code (ECC) and like all memory installed in Xserve G5, it must be installed in matching pairs.

All Xserve G5s that are ordered with any 2 GB DIMM option use a different logic board that provides hardware support for up to 16 GB of RAM. You can only install 2 GB DIMMs in logic boards that specifically support it.

How to determine if your main logic board supports 2 GB DIMMs

Xserve G5 main logic boards that support 2 GB DIMMs will either have a "DDR 2GB" label affixed between the PCI expansion slots and the DIMM slots, or will have "DDR 2GB" imprinted on the board. See the diagram below for the exact placement.

Xserve logic boards that do not have this label do not support 2 GB DIMMs. If you install a pair of 2 GB DIMMs in an Xserve that doesn't support them, the DIMMs will not be recognized by the system and won't be utilized.

If you need to perform a main logic board replacement, be sure that the replacement board has the same level of memory support as the original one by checking for this label.

Installing 2 GB DIMMs

Along with 2 GB DIMM support, Xserve G5 continues to support 1 GB, 512 MB, and 256 MB DIMMs. Remember that all memory must be installed in matching pairs. When mixing higher density and lower density DIMMs in the same system, you may need to reconfigure your memory. Install the larger DIMMs, in pairs, from the center out.

If extra slots are available and you want to install more memory, install additional DIMMs in pairs, one per bank, from the center outward.

Mac OS X Server Software

For 2 GB DIMM support, Xserve G5 systems require Mac OS X Server version 10.3.7 (7T66) or later. Earlier versions of Mac OS X Server are not supported.

Xserve Remote Diagnostics and 2 GB DIMMs

Use Xserve Remote Diagnostics (XRD) version 1.0.2 or later to test Xserve G5 systems with 2 GB memory modules (DIMMs) installed. Earlier versions of the software might erroneously report memory failures. If you must run the older software, you can avoid the erroneous reports by installing 2 GB DIMMs in the inside slots and working your way outward with smaller DIMMs, as shown in the illustration above.

Final Cut Express: DV Converter Easy Setup and Print To Video Incompatibilities

This article has been archived and is no longer updated by Apple.

If you use a DV converter in Final Cut Express and choose either DV-NTSC DV Converter or DV-PAL DV Converter in the Easy Setup dialog to configure it, Final Cut Express may stop responding (hang) whenever you choose "Print to Video" (the "Print to Video" dialog never appears).

To use Print to Video with a DV Converter, follow these steps as a workaround:

1. From the **Final Cut Express** menu, choose **Easy Setup**.
2. From the **Setup For** pop-up menu, choose either **DV-NTSC** or **DV-PAL**.
3. Click Setup.
4. From the **File** menu, choose **Print to Video**
5. Deselect the "Automatically Start Recording" checkbox. If you don't, the following error will appear:
   "Unable to perform edit operation. The tape appears to be write protected."

When capturing additional video, you must reselect your DV-NTSC DV Converter or DV-PAL DV Converter in the Easy Setup menu or else the capture will fail and the following error will appear:

"Waiting for Timecode Device. Must be in VTR mode when Device Control is enabled"

If this occurs, press the Escape (Esc) key to stop the capture, change the Easy Setup back to DV-NTSC DV Converter or DV-PAL DV Converter, and begin the capture again.

Published Date: Oct 10, 2016

iMovie: Black bars around video

This article has been archived and is no longer updated by Apple.

When you import video footage into iMovie, you may see black bars (or black space) on the top and bottom or the sides of the video image. This is normal. Digital video footage is recorded using standard ratios of width to height measurements, called the *aspect ratio*.

Standard definition video has an aspect ratio of 4:3, meaning for every four pixels of width, the frame has 3 pixels of height. A television screen has a 4:3 aspect ratio. Widescreen video has a 16:9 aspect ratio, meaning that the width of the frame is almost twice its height. Movie theaters have screens that can display this aspect ratio.

Depending on the aspect ratio of your footage (your camera may support both standard and widescreen formats), you may see one of the following black bar displays.

Black bars on the top and bottom (letterboxing)

If you see black bars on the top and bottom of your video image, your footage is being displayed in letterbox format. This happens when widescreen video footage (16:9 aspect ratio) is displayed on a 4:3 aspect ratio screen (like watching a widescreen DVD movie on a standard TV).

Black bars on both sides (pillarboxing)

If you see black bars on both sides of the video image, your footage is being displayed in pillarbox format. This happens when standard definition video footage (4:3 aspect ratio) is displayed on a 16:9 aspect ratio screen (like watching a standard definition broadcast on a widescreen HDTV).

Logic Pro: Custom presets may be missing from the pop-up menu

This article has been archived and is no longer updated by Apple.

If a custom plug-in setting, an EXS instrument, or a channel strip setting does not show up in its respective pop-up menu, check to see if you may have saved the affected item under a name that begins with a minus sign (-), such as "-3 dB." Logic excludes files with names that begin with a minus sign from its pop-up menus.

If this is the case, rename the affected file to resolve the issue. You will need to locate the file in its appropriate subfolder in `~/Library/Application Support/Logic/Plug-In Settings/`.

Mac OS X Server 10.3: Man pages for Cyrus and Postfix master programs

This article has been archived and is no longer updated by Apple.
Mac OS X Server stores the man (manual) pages for Cyrus and Postfix controller pages at separate locations within its man page system. If you try to read the man page for the Cyrus master program, you may get the man page for the Postfix master program instead.

Because both programs use the name "master" for the controller process that handles all daemon control, their man pages now use distinct names so you can access both programs' man pages.

To access the man page for the Cyrus mail master program, use `man cyrus-master`. To access the man page for the Postfix mail master program, use `man master`.

iDVD 5: "Invalid drawable" message in Console

This article has been archived and is no longer updated by Apple.
When you open iDVD, the Mac OS X Console application (in the Utilities folder) may display an "invalid drawable" message. Please note that this message does not indicate an error or an issue with iDVD. While the Console is normally the place to look for possible clues when you're troubleshooting an issue, this particular message can be ignored.

To learn about viewing log files in the Console, click here.

Logic 7: Changes to preference location, file name, and troubleshooting practices

This article has been archived and is no longer updated by Apple.

Logic Pro 7 and Logic Express 7 both have different preference file names, compared to earlier versions. Additionally, these preferences are now set apart in a Logic subfolder of your Preferences folder. The new preference files are stored as follows:

Logic Pro 7: `~/Library/Preferences/Logic/com.apple.logic.pro`
Logic Express 7: `~/Library/Preferences/Logic/com.apple.logic.express`

If Logic 7 detects that the current preference file is missing (if you moved it for troubleshooting, for example), it will seek and load an older preference file if one exists on your computer. If you have an older version of Logic installed, its preference file is stored here:

```
~/Library/Preferences/info.emagic.logic
```

Older versions of both Logic Pro and Logic Express used this earlier version of the preference file. Therefore, if you move your current preferences file for troubleshooting, be sure to move the older version as well (if applicable).

Additionally, there are some legacy preference files that you may wish to remove for troubleshooting Logic Pro and Logic Express 7.

```
~/Library/Preferences/info.emagic.logic.cs
~/Library/Preferences/info.emagic.logic.plist
~/Library/Preferences/info.emagic.logicsetupassistant.standard.plist
```

The first of these legacy files stores control surface preferences. The second stores information regarding recently used folders, and so forth. The third is created by the Setup Assistant, and it stores the default song setup.

Finally, you may also find the Project Manager database from older versions of Logic Pro needs to be removed. This is found at:

```
~/Library/Preferences/Logic PM Data
```

Remove the Logic PM Data folder before launching Logic Pro 7.

With Logic Pro 7, the Project Manager database is located at `~/Library/Preferences/Logic/PM Data`

AirPort: Software changes with AirPort 4.1 for Mac OS X 10.3

This article has been archived and is no longer updated by Apple.
When you install AirPort 4.1 for Mac OS X 10.3 (Panther), some of the names and the number of AirPort administration utilities on your computer will change. AirPort software prior to version 4.1 included AirPort Admin Utility, AirPort Setup Assistant, and possibly AirPort Express Assistant.

AirPort 4.1 includes a new version of AirPort Setup Assistant that makes AirPort Express Assistant obsolete—AirPort Express Assistant will be removed when you install AirPort 4.1 if the application is present on your system.

The old version of AirPort Setup Assistant is retained, but will be renamed as "AirPort Setup Assistant for Graphite or Snow." This is because the new assistant in version 4.1 is for AirPort Express and AirPort Extreme use only. Be sure to select the older, renamed assistant when administering an original AirPort Base Station (Graphite) or AirPort Base Station (Dual Ethernet), also known as "Snow."

AirPort Admin Utility will be updated, and will continue to work with all models of AirPort base stations.

iPhoto 5 or later: "Error occurred while exporting the slideshow" message

This article has been archived and is no longer updated by Apple.
When you choose **Send to iDVD** or **Export** from the **Share** menu in iPhoto 5 or later, there's certain circumstances in which you might get a message that says, "An error occurred while exporting the slideshow."

This can happen if you rename, move, or delete the Movies folder found in your home directory; because iPhoto tries to save to the Movies folder specifically. To resolve this issue, put the Movies folder back in your home directory (or create a new one if necessary).

This can also happen with some versions of Norton Anti-Virus. Try temporarily disabling Norton Antivirus to see if it helps.

Mac OS X: Using the Active Directory plug-in in a multi-domain controller environment

This article has been archived and is no longer updated by Apple.
Sometimes the Active Directory plug-in won't bind to Active Directory in a domain with multiple domain controllers (DCs). In this situation, you may get a message that warns of insufficient privileges or an incorrect name or password, and the subsequent binding won't happen. This issue affects Mac OS X and Mac OS X Server versions 10.3 and later.

To resolve the issue, enter a name of a domain controller in the "Prefer this domain server" field in the Advanced Options section of the Active Directory plug-in. This will ensure that the Active Directory plug-in binds to this domain controller first if that domain controller is available on the network.

Tip: If you are new to configuring Directory Services plug-ins, you can access the Active Directory plug-in by opening the Directory Access utility (located in your Utilities folder) and selecting Active Directory.

Logic Pro 7 does not offer variable bit depth for freeze files

This article has been archived and is no longer updated by Apple.
Logic Pro 6 offered a way to change any freeze file's bit depth from the default 32-bit float to 24- or 16-bit. Though Logic Pro 7 does not offer this feature, it has new features that support the same goals.

Logic stores freeze files at a resolution of 32-bit float to preserve the massive dynamic range (almost 1000 db) that its audio engine affords. This prevents extreme plug-in settings from causing clipping in files when they are rendered, ensuring that the frozen tracks will sound identical to their unfrozen states.

Previous versions of Logic Pro offered the option of freezing files at 16- or 24-bit depth to allow these rendered files to be used in other songs, or even other applications. However, there was some danger that the frozen tracks could clip, depending on the plug-in settings used. Logic Pro 7 offers a wealth of new export features that make changing the bit depth of frozen tracks unnecessary.

To export a track (with all its DSP rendered), simply choose **File > Export > Track as Audio File**. To export all audio tracks in your Arrange window as separate audio files, choose **File > Export > All Tracks as Audio Files**. To export an individual region with its DSP rendered to a file, choose **File > Export > Region as Audio File**.

When exporting tracks, note that any reverb or delay tails will be included with the exported file, but the files created from exported regions will be exactly the same length as the original region. This allows you to easily create loops using the export region feature.

You can export tracks and regions as AIFF, WAV, or SDII files, making them compatible with virtually any other audio application available. If you export regions as WAV files, they will be written as Broadcast Wave Files (BWF), which means they will include time-stamp information. Tracks are always exported starting at bar 1 in a Logic song, so time-stamping is not needed for them.

Logic Pro 7: Using the External Instrument

This article has been archived and is no longer updated by Apple.

One of the little known but most useful new features in Logic Pro 7 is the External Instrument. This is a special instrument plug-in that allows you to route MIDI information to an external MIDI hardware module and, utilizing your audio interface, feed that module's audio output directly into Logic. This allows you to treat the MIDI module like a software audio instrument in Logic; you can add plug-ins, bounce it as part of your mix, and so on.

Here's how to set up an External Instrument track for your MIDI device:

1. Select an available Audio Instrument track in your Arrange window.
2. In the channel strip to the left, click the input insert (the field directly below "I/O") and choose **Stereo > Logic > External** (for stereo) or **Mono > Logic > External** from the menus.

3. The External Instrument window opens.

Note: If it does not open, double-click the plug-in (preference).

4. Click the MIDI Destination insert area to display a menu that lists the MIDI devices defined in your Environment, and choose an instrument. (In our example, we chose the strings channel in our Roland JV1080.) Your menu items will vary, depending on what MIDI modules you own, and how you have them configured in your Environment.

5. To configure the External Instrument with your audio interface input (make sure that you physically connected your MIDI module's audio output to your audio interface's input), click the Input insert area to display a menu of available audio inputs for your audio interface.
6. Choose the audio input that your MIDI module is physically connected to from the menu. If you need to adjust the gain from the module, use the Input Volume slider to adjust the volume from -24db to +12db.

You can now record MIDI to the Audio Instrument track. Logic will route MIDI to the external module, and will see its audio at the input you defined. You can insert DSP plug-ins and (as with a software instrument) use sends to busses, and so on. You can also include sounds from External Instruments when you bounce your mix, but keep this in mind: You must perform your bounce in "Realtime"—not "Offline"—for this to happen. Logic cannot process the audio from an external device offline.

Mac OS X 10.4, 10.5: Where is StuffIt Expander?

This article has been archived and is no longer updated by Apple.

Allume StuffIt Expander doesn't come with Mac OS X 10.4 or later.

However, Mac OS X 10.4 and Mac OS X 10.5 Leopard or later let you compress and decompress archive (.zip) files that work with both Mac OS X and Microsoft Windows.

If you'd like to use StuffIt Expander too, for example, to open .sit or .sitx compressed files, you can download it from the Allume Systems website.

Final Cut Pro: Different alpha channel types may produce different results

This article has been archived and is no longer updated by Apple.

When you import assets, Final Cut Pro uses the imported alpha channels to composite image layers over one another. You can import graphic files that use different methods of handling alpha channels, such as graphics that contain straight or premultiplied alpha channels. Or you can use one image to impose an alpha channel onto another.

Depending on the type of alpha channel used by the assets in your project, the end results may differ slightly. In most cases, graphics that have a premultiplied alpha layer will yield the best results. For more information on alpha channels and compositing in Final Cut Pro, please see the Final Cut Pro Help guide (choose **Help** > **Final Cut Pro Help**).

Logic Pro and Logic Express 7.1: Loop Browser displays collections instead of all installed loops

This article has been archived and is no longer updated by Apple.
In Logic Pro and Logic Express 7.1 and later, the Loop Browser does not display all indexed loops in the system.

Instead, Logic 7.1 offers a new Advanced Loop Management feature in the Loop Browser that allows you to view loops from specific collections. For example, you can choose to view only loops that are included with GarageBand (which is the same loop collection that is installed with Logic), from a specific Jam Pack, from a specific third-party vendor, or only loops you created yourself.

If you are unable to locate a loop that you know is installed and indexed in your system, make sure that the Jam Pack Management setting in the upper right portion of the Loop Browser is either set to the collection that your desired loop belongs to, or to Show All.

Mac OS X 10.4: DVD Player closed captioning may be unreadable at half size

This article has been archived and is no longer updated by Apple.

If you size your DVD Player window to half size and play a DVD, the captions may be hard to read. But you can easily resolve this.

One thing you can do is resize the DVD Player window so that it's larger.

Another option you have is to display captions in their own window. From the **Controls** menu, select **Closed Captioning > Separate Window**.

There's also a third option:

- From the **Apple** menu, choose **System Preferences**.
- In the System Preferences window, click Appearance.
- In the sentence, "Turn off text smoothing for font sizes __ and smaller," choose **6** from the font size pop-up menu.

Logic Pro 7: Locations of EXS24 files

This article has been archived and is no longer updated by Apple.

The EXS24 Sampler plug-in in Logic Pro uses several types of files to generate sound. An EXS24 "Instrument" consists of an instrument file, which contains information on the samples used and how they map to the MIDI notes that trigger them, as well as information on zone and group assignments. The instrument files for Logic's EXS Factory sounds are located at:

```
/Library/Application Support/Logic/Sampler Instruments
```

Any instruments you create will be stored at:

```
~/Library/Application Support/Logic/Sampler Instruments
```

Note: The tilde (~) represents your Home folder.

The audio files that the instruments refer to can be stored on any local drive. The samples for the sampler instruments that are installed with Logic are located at:

```
/Library/Application Support/Logic/EXS Factory Samples
```

How to install additional fonts included with Mac OS X 10.3

This article has been archived and is no longer updated by Apple.

Mac OS X 10.3 comes with additional language fonts that aren't part of the default install set, but you can easily install them at any time, no matter what version of Mac OS X 10.3 you're currently using. These language fonts include:

- Arabic
- Hebrew
- Thai
- Cyrillic
- Devanagari
- Gujarati
- Punjabi
- Armenian
- Cherokee
- Inuktitut

If you'd like to install any of these fonts, follow these steps:

1. Insert Mac OS X 10.3 Install Disc 3 (if you have install CDs) or the Mac OS X 10.3 Software Install DVD.
2. If you have an Install CD, open the Packages folder that's on the disc. Then skip to step 4. If you have an Install DVD, continue to the next step.
3. Note the name of the DVD on the desktop (such as "iMac Software"). In the Finder, choose **Go to Folder** from the **Go** menu, and type

   ```
   /volumes/name of DVD/System/Installation/Packages
   ```

   (where "name of DVD" is the name of your DVD), then click Go.

4. Double-click "AdditionalFonts.pkg" to open the installer.
5. Follow the onscreen instructions to install the fonts.

About additional Asian fonts

Your Mac OS X 10.3 disc also includes an installation package called Additional Asian Fonts, which contains additional fonts supporting Simplified Chinese, Traditional Chinese, and Korean. This package is installed by default with Mac OS X 10.3. However, if you customized your original Mac OS X 10.3 installation and didn't install these fonts, you can install them later using the same steps above.

The AdditionalAsianFonts.pkg is located on Mac OS X 10.3 Install Disc 2 (for CD installations) or the Mac OS X 10.3 Software Install DVD.

Logic Pro and Logic Express 7.1: Loop Type options may be unavailable when adding regions to the Loop Library

This article has been archived and is no longer updated by Apple.
Logic 7.1 allows you to add audio regions from audio tracks or MIDI regions from audio instrument tracks to your Loop Library. To do this, highlight the region you wish to add, and then from the Arrange window's menu bar, choose **Region > Add to Apple Loops Library**.

A dialog appears, allowing you to set the tags for the loop. You can set the loop Type by selecting either the Loop radio button (the loop will conform to the tempo of the song) or the One-shot radio button (the loop will maintain a fixed duration, ignoring the song tempo).

However, sometimes these radio buttons may appear dimmed, with the Type set to One-shot.

This can happen if the selected region is not precisely trimmed to contain a number of whole bars. Only regions that are set to whole bar lengths will give you the option of selecting the loop type (either Loop or One-shot); all others can only be added as a One-shot. There are several ways to work around the issue:

- Trim the region so that its length spans a number of whole bars at the current song tempo.
- Change the tempo of the song to conform to the region.
- Add the loop using the Apple Loop Utility application. You can do this from within Logic; just highlight the region and, from the Arrange window's menu bar, choose **Audio > Open in Apple Loops Utility**.

Apple Loops Utility allows you to define the intended length of the loop, regardless of the song tempo. Please note that the utility only works with audio regions—not with MIDI regions on Audio Instrument tracks.

Xsan: New folders may have unexpected group ownership

This article has been archived and is no longer updated by Apple.
When creating folders on an Xsan volume, the group owner of a new folder is the primary group of the user who created it—not the group owner of the parent folder.

Because of this, users who are members of a common group, but who have other primary groups, may create folders with varying ownership inside the folder of their common group. Members of this group may expect to have access to everything inside of the common group's folder, but that won't be the case.

To resolve the issue, log in as an administrator, select the affected folder, and Get Info. In the Ownership & Permissions section of the Info window, change the ownership to the desired group.

Logic: Where custom key commands get stored

This article has been archived and is no longer updated by Apple.
Logic Pro and Logic Express give you the ability to customize the key commands that trigger various commands and functions. Logic stores these key commands in its preference file. It's a good idea to keep a backup copy of this file in case you ever have an issue with the original, or you want to import your key commands into a different system. Here's where this file is stored:

Logic Pro: `~/Library/Preferences/Logic/com.apple.logic.pro`
Logic Express: `~/Library/Preferences/Logic/com.apple.logic.express`

If you ever want to import key commands from a backup copy of the file, you can do so by opening the Key Commands window, as follows:

1. Choose **Logic Pro** (or **Logic Express**) **> Preferences > Key Commands**.
2. In the resulting Key Commands window, choose **Import Key Commands** from the **Options** pop-up menu.
3. In the resulting dialog, navigate to and select the backup copy of your preferences file and click Open.

The key commands from your backup copy will be imported into the current preference file, replacing all previous commands.

PowerBook G4 (12-inch 1.5GHz), PowerBook G4 (15-inch 1.67/1.5GHz), PowerBook G4 (17-inch 1.67GHz): Troubleshooting intermittent trackpad issues

This article has been archived and is no longer updated by Apple.
If you find that the trackpad cursor on your PowerBook G4 (12-inch 1.5GHz), PowerBook G4 (15-inch 1.67/1.5GHz), or PowerBook G4 (17-inch 1.67GHz) temporarily stops tracking or behaves erratically, try the following steps to resolve the issue.

1. Make sure you're using just one or two fingers. Using more than two fingers could cause erratic behavior.
2. Make sure you have installed the latest version of the system software. For Mac OS X 10.3, this is Mac OS X 10.3.9.
3. Reset the trackpad by placing your entire palm directly onto the whole trackpad for 3 to 4 seconds, and then remove your hand from the trackpad in one smooth motion.

In most cases, trackpad operation will return to normal. If you have updated your system software and reset the trackpad and operation is still not working as expected, test the computer for five to ten minutes. If, after that length of time, there is still no improvement, you may need to contact Apple using the support phone number that is listed for your country.

iMovie: MPEG artifacts or blank video bands in footage

This article has been archived and is no longer updated by Apple.
If you're importing footage from your camera and you see see large blocks of MPEG artifacts or blank bands of video interspersed in the footage, the tape may be damaged or your camera may need cleaning. Consult the documentation that came with your camera to see if there is a way to clean the camera heads using a cleaning tape or similar procedure.

If you are using a camera that can record in multiple formats (such as HDV, DV, and/or DV Widescreen) and you see similar symptoms, you may have footage on the tape that was shot in different formats from multiple recording sessions. Avoid capturing different video formats on the same tape. Try using a fresh tape and record in one format to troubleshoot the issue.

Xsan is disabled after installing Security Update 2005-002

This article has been archived and is no longer updated by Apple.

If you're running Xsan and just installed Security Update 2005-002, you may come across an issue where the Xsan filesystem becomes disabled and won't start up. This happens because this security update overwrites the hostconfig file in the /etc directory, which removes the command to start the Xsan filesystem.

To resolve this issue, modify the hostconfig file as follows:

1. Launch the Terminal (/Applications/Utilities).
2. Change to the root user by typing `su root`. Type your password when prompted.
3. Type `cd /etc` to navigate to the /etc directory.
4. Open your preferred editor (such as vi, emacs, or pico), and use it to add the following line to the bottom of the hostconfig file: `ACFS=-YES-`.
5. Save the file and then close your editor application.
6. Restart your computer.

Note: You will need to modify the hostconfig file on all Xsan clients and Metadata Controllers after installing Security Update 2005-002.
Published Date: Feb 19, 2012

Logic Pro/Express 7: Logic stores opened GarageBand files in the same location as the original

This article has been archived and is no longer updated by Apple.

When you open a GarageBand song in Logic Pro or Logic Express, a folder is created at the same location as the original GarageBand song to hold the corresponding Logic song and all audio files that are needed to play it back. For example, if you have a GarageBand song named "My Hit Song" stored in your GarageBand folder (~/Music/Garageband), Logic will create a folder named "My Hit Song" in that same folder.

If you would rather store the song at another location, choose **File > Save as Project** in Logic to save the song and all audio files to another location on your computer.

About Security Update 2005-003

This article has been archived and is no longer updated by Apple.
This document describes Security Update 2005-003, which can be downloaded and installed using Software Update, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred, and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How To Use The Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Security Update 2005-003

- **AFP Server**
  Available for: Mac OS X v10.3.8, Mac OS X Server v10.3.8
  CVE-ID: CAN-2005-0340
  Impact: A specially crafted packet can cause a Denial of Service against the AFP Server.
  Description: A specially crafted packet will terminate the operation of the AFP Server due to an incorrect memory reference. Credit to Braden Thomas for reporting this issue.

- **AFP Server**
  Available for: Mac OS X v10.3.8, Mac OS X Server v10.3.8
  CVE-ID: CAN-2005-0715
  Impact: The contents of a Drop Box can be discovered.
  Description: Fixes the checking of file permissions for access to Drop Boxes. Credit to John M. Glenn of San Francisco for reporting this issue.

- **Bluetooth Setup Assistant**
  Available for: Mac OS X 10.3.8, Mac OS X Server 10.3.8
  CVE-ID: CAN-2005-0713
  Impact: Local security bypass when using a Bluetooth input device.
  Description: The Bluetooth Setup Assistant may be launched on systems without a keyboard or a preconfigured Bluetooth input device. In these cases, access to certain privileged functions has been disabled within the Bluetooth Setup Assistant.

- **Core Foundation**
  Available for: Mac OS X v10.3.8, Mac OS X Server v10.3.8
  CVE-ID: CAN-2005-0716
  Impact: Buffer overflow via an environment variable.
  Description: The incorrect handling of an environment variable within Core Foundation can result in a buffer overflow that may be used to execute arbitrary code. This issue has been addressed by correctly handling the environment variable. Credit to iDEFENSE and Adriano Lima of SeedSecurity.com for reporting this issue.

- **Cyrus IMAP**
  Available for: Mac OS X Server v10.3.8
  CVE-ID: CAN-2004-1011, CAN-2004-1012, CAN-2004-1013, CAN-2004-1015, CAN-2004-1067
  Impact: Multiple vulnerabilities in Cyrus IMAP, including remotely exploitable denial of service and buffer overflows.
  Description: Cyrus IMAP is updated to version 2.2.12, which includes fixes for buffer overflows in fetchnews, backend, proxyd, and imapd. Further information is available from http://asg.web.cmu.edu/cyrus/download/imapd/changes.html.

- **Cyrus SASL**
  Available for: Mac OS X v10.3.8, Mac OS X Server v10.3.8
  CVE-ID: CAN-2002-1347, CAN-2004-0884
  Impact: Multiple vulnerabilities in Cyrus SASL, including remote denial of service and possible remote code execution in applications that use this library.
  Description: Cyrus SASL is updated to address several security holes caused by improper data validation, memory allocation, and data handling.

- **Folder permissions**
  Available for: Mac OS X v10.3.8, Mac OS X Server v10.3.8
  CVE-ID: CAN-2005-0712
  Impact: World-writable permissions on several directories, allowing potential file race conditions or local privilege escalation.
  Description: Secure folder permissions are applied to protect the installer's receipt cache and system-level ColorSync profiles. Credit to Eric

Hall of DarkArt Consulting Services, Michael Haller (info@cilly.com), and (root at addcom.de) for reporting this issue.

- **Mailman**
  Available for: Mac OS X Server v10.3.8
  CVE-ID: CAN-2005-0202
  Impact: Directory traversal issue in Mailman that could allow access to arbitrary files.
  Description: Mailman is a software package that provides mailing list management. This update addresses an exposure in Mailman's private archive handling that allowed remote access to arbitrary files on the system. Further information is available from http://www.gnu.org/software/mailman/security.html.

- **Safari**
  Available for: Mac OS X v10.3.8, Mac OS X Server v10.3.8
  CVE-ID: CAN-2005-0234
  Impact: Maliciously registered International Domain Names (IDN) can make URLs visually appear as legitimate sites.
  Description: Support for Unicode characters within domain names (International Domain Name support) can allow maliciously registered domain names to visually appear as legitimate sites. Safari has been modified so that it consults a user-customizable list of scripts that are allowed to be displayed natively. Characters based on scripts that are not in the allowed list are displayed in their Punycode equivalent. The default list of allowed scripts does not include Roman look-alike scripts. Credit to Eric Johanson (ericj@shmoo.com) for reporting this issue to us. More information is available here.

- **Samba**
  Available for: Mac OS X v10.3.8, Mac OS X Server v10.3.8
  CVE-ID: CAN-2004-0882, CAN-2004-0930, CAN-2004-1154
  Impact: Multiple vulnerabilities in Samba including remote denial of service and possible remote execution of arbitrary commands
  Description: Several security vulnerabilities were addressed in recent Samba releases. Security Update 2005-003 installs Samba version 3.0.10 to provide these fixes. Further information is available from the Samba security site located at http://www.samba.org/samba/history/security.html

- **SquirrelMail**
  Available for: Mac OS X Server v10.3.8
  CVE-ID: CAN-2004-1036, CAN-2005-0075, CAN-2005-0103, CAN-2005-0104
  Impact: Multiple vulnerabilities in Squirrelmail including cross-site scripting and html injection
  Description: SquirrelMail 1.4.4 addresses several security issues including various cross-site scripting exposures and the possibility of using webmail.php to include web pages from remote servers. CAN-2005-0075 is an issue fixed in SquirrelMail 1.4.4, but which does not affect the default configuration of Mac OS X Server since register_globals is not enabled. Further information is available from the SquirrelMail security site located at http://www.squirrelmail.org/changelog.php

- **Telnet**
  Available for: Mac OS X v10.3.8, Mac OS X Server v10.3.8
  CVE-ID: CAN-2005-0468, CAN-2005-0469
  Impact: Malicious telnet servers may cause local code execution
  Description: This update addresses two buffer overflows in the telnet client that could lead to local code execution by a malicious telnet server. Credit to iDEFENSE for reporting this issue.

Logic Pro/Express 7: Audio region does not play as expected after being split

This article has been archived and is no longer updated by Apple.

Sometimes after you split an audio region into two or more shorter regions, the first part of your new regions won't play back as expected. Specifically, the beginning part may not play back properly or at all if the region's anchor point appears at the very end.

This can happen if you split an audio region at the same point as its anchor. In the example below, our region starts a bit before bar 5 and ends at bar 21 in the Arrange window.

If we look at the region in the Sample Edit window, the anchor for the region appears exactly at bar 5 (the black triangle below the region). We set it this way because the downbeat falls exactly on bar 5 in this audio region (the audio before bar 5 is a pickup).

When we split the region at bar 5 and again at bar 13, our region looks like this in the Arrange window:

When we open the first region—the short one that starts a bit before bar 5—in the Sample Edit window, the anchor still appears at bar 5, but it's now at the very end of the region.

This is the cause of the issue—Logic won't play a region back properly if its anchor is at the very end. To resolve the issue: In the Sample Edit window, choose **Edit > Update Arrange Position**, then drag the anchor back to the beginning of the region, or to a point before the very end, as in this image:

Published Date: Feb 19, 2012

Logic Pro/Express 7: Core Audio driver cannot be selected

This article has been archived and is no longer updated by Apple.

In some situations, the Driver selection menu and other settings in the Core Audio preference pane of Logic Preferences (from the **Logic Pro** or **Logic Express** menu, choose **Preferences**, then **Audio**, click the Drivers tab, then click the Core Audio tab) may appear dimmed (unavailable).

This happens if Core Audio is disabled, which can occur after you remove your Logic preferences or install Logic on a fresh system without running the Setup Assistant.

To select a driver:

1. Click the Enabled button in the upper left corner of the Core Audio pane in the Preferences window. A dialog appears, asking you to reboot Logic:

2. Click OK. All the settings should now be accessible.

3. To select a driver, choose an audio interface from the **Driver** pop-up menu.

4. Another dialog appears, asking you to reboot. This time click Try (Re)Launch to initialize your selected driver.

Logic Pro/Express: 7.0: Applying fades to Apple Loops makes them play in their original key

This article has been archived and is no longer updated by Apple.

If you apply a fade to an Apple Loop in the Arrange window, the portion of the loop encompassed by the fade will play at the loop's original key and tempo, rather than the key and tempo of the song. This issue occurs with Logic Pro 7.0 and Logic Express 7.0.

The core issue is that Apple Loops do not support fades, so you shouldn't assign a fade directly to one. If you'd like to achieve the effect, export the Apple Loop (in the Arrange window, choose **File > Export > Region as Audio file**). Then bring the exported file back into the Arrange window and apply the fade to it.

Logic 7.1 and later prevents this issue by disallowing fade application to an Apple Loop.

Published Date: Feb 19, 2012

Logic Pro 7: First note may be missing from exported audio file

This article has been archived and is no longer updated by Apple.

If you have a pickup note (a note that starts right before measure 1) in an Audio Instrument track and export the track as an audio file, the pickup note will be missing from the exported file.

As a workaround, move the pickup note so that it falls on or after bar 1. For example, if a MIDI note falls slightly before bar 1 (say, at 0 4 4 235), you can move the note to somewhere within bar 1. If your song has a pickup of several beats before bar 1 (or if moving the first note is impractical), select all the regions in the Arrange window and move them (including all automation data) to the right one bar so that the pickup starts at or within bar 1.

Using Apple displays with computers running Windows

This article has been archived and is no longer updated by Apple.

The Apple Cinema Display product line features the industry standard DVI connector, which allows it to be connected to a variety of computer systems, including both Apple and Windows-based computers. The DVI connection, along with the VESA DDC support, removes the barriers to using an Apple display with a non-Macintosh PC. As long as your graphics card supports the full single link and/or dual link bandwidth defined in the DVI specification and incorporates DDC technology, your PC graphics card will support the Apple Cinema Display line.

The 23-inch Apple Cinema HD Display and the 20-inch Apple Cinema Display require a single link DVI signal. The 30-inch Cinema HD Display requires dual link DVI support to drive its massive amount of pixels.

The table below includes a list of video cards from a number of different manufacturers that Apple has verified to provide VESA DDC as well as DVI single link and/or dual link support. Video cards from other manufacturers that are not listed may also be compatible.

Nvidia Quatro FX by PNY Technologies

Model tested:	Apple Cinema Display (20-inch DVI)	Apple Cinema HD Display (23-inch DVI)	Apple Cinema HD Display (30-inch DVI)

Logic Pro 7.0: Stops responding when initializing nodes in Mac OS X 10.4 Tiger

This article has been archived and is no longer updated by Apple.

If nodes are enabled in Logic Pro 7.0 or 7.01, Logic will stop responding when it tries to initialize Core Audio on Mac OS X 10.4 Tiger systems. To use the distributed audio feature in Tiger, you must upgrade to Logic Pro 7.1.

Logic Pro/Express 7.1: US-2400 control surface detected incorrectly

This article has been archived and is no longer updated by Apple.

If you have a Tascam US-2400 connected to your computer, it will be detected incorrectly when Logic initially scans for control surfaces. The Tascam US-2400 should be detected as if it were a Logic/Mackie Control and two Logic/Mackie Control XTs. Instead the unit is detected as if it were a Logic/Mackie Control and two Mackie C4s. Additionally, the fader banks are in the wrong order. As a result, the control surface will not operate properly with Logic.

To resolve this issue, delete the control surfaces that Logic has automatically scanned and manually rescan the US-2400 by doing the following:

1. From the **Logic Pro** or **Logic Express** menu, choose **Preferences > Control Surfaces > Setup**.
2. In the window, delete the icons for any detected control surfaces.
3. From the Setup window's menu bar, choose **New> Install**. An install window appears.
4. Select Tascam US-2400 in the list.
5. Click the Scan button in the upper left corner of the Install window.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Logic Pro/Express: Plug-ins from old songs not available

This article has been archived and is no longer updated by Apple.

When you load an old song into Logic Pro or Logic Express, sometimes the plug-ins won't appear on the inserts or if they do, they appear crossed out with a diagonal line. This happens when you load a song that was created with a different type of audio driver (for example, you created the song in Mac OS 9 with an ASIO driver). Logic will often offer to automatically convert the song to Core Audio, but here are some situations where this will not occur:

- The Universal Track Mode setting for the current audio driver does not match the setting on the system that the song was created.
- The song was created with multiple audio drivers.

In this situation, it will also be impossible to insert new plug-ins. Clicking on an insert will only display No Plug-in because the wrong driver is specified in the parameter box for audio objects in the song's Environment. There are several steps you can take to resolve this issue:

1. Go to the Environment, and select all of the audio objects (take care not to select any other types of objects).
2. Go to the parameter box on the left side of the Environment window, and change the Device setting from whatever it was set to originally (ASIO, AW, and so forth) to CoreAudio. Depending on how your Environment is set up in your song, you may have to go through multiple layers in the Environment to get all of the audio objects.

Notice that all of the inserted plug-ins on your audio channel strips will disappear. The following steps correct this.
3. Choose **Audio > Audio Configuration** to open the window.
4. Choose the driver that your song was originally saved with from the window's **Device** menu.

5. From the window menu bar, choose **Edit > Copy**.
6. From the window menu bar, choose **Device > CoreAudio**.
7. From the window menu bar, choose **Edit > Paste**.

The plug-ins should reappear in their proper insert slots on each audio channel strip. If they do not, choose **Logic Pro > Preferences > Audio** and click the Drivers tab in the resulting window. Toggle the Universal Track Mode checkbox from whatever it is currently set to and then repeat steps 3-7 above. You can reset your Universal Track Mode selection after you've pasted the configuration to Core Audio.

Logic Pro 7.1: Progress bar stops progressing when loading Elastic Audio tracks into RAM

This article has been archived and is no longer updated by Apple.

A new feature in Logic Pro 7.1 is Elastic Audio, which enables your recorded tracks to follow any tempo changes you make after you've recorded them. However, the progress bar that displays when Logic loads Elastic Audio tracks into RAM may stop progressing if there isn't enough RAM to load the files.

If this happens, abort the process by pressing Command-period (.).

So how much audio can you load into RAM at any given time? This will depend on the following:

- The amount of physical RAM in your computer
- The number of other open applications
- The amount of RAM being used by other applications
- The bit depth and sample rate of the audio files you're working with
- The length of the audio files
- The number and length of any Apple Loops in use
- The amount of RAM being used by the EXS-24 or other sample-based audio instruments

You can do a number of things to use the RAM on your system more efficiently:

1. Quit any other running applications.
2. Enable the Virtual Memory option for the EXS-24.
3. Work at lower sample rates or bit depths where possible.
4. Install more RAM in your computer.

Mac OS X 10.4: Adding a Bluetooth fax device

This article has been archived and is no longer updated by Apple.

Faxing over Bluetooth is possible in Mac OS X 10.4 Tiger (and Mac OS X 10.3 Panther), but not all wireless carriers and phones support faxing—and this function is not supported by AppleCare.

If you do want to add a Bluetooth-Modem fax device in Mac OS X 10.4 or later, you must add it manually. **Note**: Faxing must be supported by the phone and wireless carrier, too, for this to work. Follow these steps to add the device in Tiger:

1. If you're using a Bluetooth adapter, connect it to your computer if it isn't.
2. From the **Apple** menu, choose **System Preferences**.
3. Click Print & Fax to display the preferences.
4. Click the Printing tab.
5. Click the plus sign (+) button; the Printer Browser window opens.
6. Option-click the More Printers button.
7. In the sheet that appears, choose **Advanced** from the top pop-up menu. (If you don't see Advanced in the menu, click Cancel and repeat the previous step.)
8. From the **Device** pop-up menu, choose **Bluetooth-Modem**. (If this doesn't appear, be sure that your Bluetooth adapter is connected.)
9. From the **Printer Model** pop-up menu, choose **Other**.
10. In the resulting "Choose a File" dialog, select your Mac OS X volume icon.
11. Click on the following folders—in this order—to navigate to the PrintCore.framework Resources folder:
    System
    Library
    Frameworks
    ApplicationServices.framework
    Frameworks
    PrintCore.framework
    Resources
12. Select the appropriate folder for the language you are using. For example, North American English users should select English.lproj.
13. Select Fax.ppd and click Choose.
14. Click Add.

Your Printer Browser window should look something like this after you've completed the steps:

Once you pair your Bluetooth mobile phone with your computer, you should have the ability to send faxes using the Bluetooth-Modem (of course, faxing must be supported by the phone and wireless carrier too).

Logic Pro/Express: Automating plug-in bypasses is not sample accurate

This article has been archived and is no longer updated by Apple.

When you bypass DSP plug-ins in an automated mix, the actual change in state may sometimes occur slightly late. Setting the Audio preference for Sample Accurate Automation to "Volume, Pan, Sends, Plug-In Parameters" won't help.

For optimization reasons, bypassed plug-ins are removed from the CPU load, so it's not possible to change a plug-in's bypass state and have it be sample accurate. Instead, place the automation nodes for the plug-in's bypass and enabled states slightly earlier in your tracks.

Mac OS X 10.4: Archived file does not retain Extended Attributes or ACLs

This article has been archived and is no longer updated by Apple.

Archiving files in the Finder (from the **File** menu, choose **Create Archive**) with Mac OS X 10.4 Tiger is a great way to "bundle up" seldomly-used files. However, doing this will cause archived files to lose any set Extended Attributes (EAs) or Access Control Lists (ACLs) metadata. This issue applies to Mac OS X 10.4 and Mac OS X Server 10.4.

Not all metadata is lost when archiving—only EAs and ACLs. Other metadata, such as EXIF information in a photo file, won't be lost.

EA and ACL metadata usually comes from a Mac OS X Server administrator. So, if you don't use files that are stored on a Mac OS X Server, you probably won't notice the difference. If you want to avoid losing EAs and ACLs, don't archive files using the Create Archive feature, or use a third-party file-archiving utility that can preserve this kind of file data.

iDVD 5.0: Free Position feature may cause buttons to be incorrectly positioned

This article has been archived and is no longer updated by Apple.
In iDVD 5.0, you can change the button positions in a theme and then save the customized theme as a favorite to create your own template. However, this may have an impact on the buttons in the original theme, causing them to be incorrectly positioned.

This can happen if you select "Free Position" in the Button section of the Settings Pane, move folders around in the menu, and then click "Save as Favorite." If you then try to use the original theme in a new project, the buttons may not be positioned correctly because your custom button positions are saved in both the favorite and in the original theme when you save a theme as a favorite.

To avoid this, update to iDVD 5.0.1.

Published Date: Oct 10, 2016

iDVD 5: Supported languages

This article has been archived and is no longer updated by Apple.

You can add additional languages to the Mac OS X default language list by clicking the Edit button in the International pane of System Preferences, and then selecting any language checkbox in the resulting dialog.

iDVD 5 supports the following languages: English, Japanese, French, German, Dutch, Italian, Spanish, French Canadian, Simplied Chinese, Korean, Traditional Chinese, Swedish, Danish, Norwegian, and Finnish.

If you move a language that iDVD does not support to the top of the Languages list and then either logout and login or restart your computer, iDVD may unexpectedly quit when you use it to burn a project to DVD or save a project as a disc image. This can occur with Mac OS X 10.3 or later.

To resolve this issue, make sure that the language at the top of the Language list in the International pane of System Preferences matches one of the supported languages when you burn iDVD projects. If it doesn't, drag one of the supported languages to the top of the list, burn your project, and then move your chosen language back to the top.

You will need to logout and login or restart the computer before trying iDVD again.

This document will be updated as more information becomes available.

iPod photo: Use your camera‘s erase function to erase a media card completely

This article has been archived and is no longer updated by Apple.

You can use the Erase Card option on iPod photo (it's in the Photo Import screen) to erase files from a media card after importing photos from an attached camera or media reader. However, keep the following issues in mind:

- Selecting Erase Card can take longer than expected to complete; you may want to use your camera to erase the pictures instead.
- The Erase Card option does not delete files outside of the DCIM folder on the media card. If you want to erase your card completely, use your camera's format or erase card feature to do this.
- Certain Nikon cameras connected in PTP mode may not erase pictures. If this affects you, try connecting your camera in Mass Storage mode, or just use your camera to erase the pictures instead.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

iPod photo: How to delete imported photos from iPod

This article has been archived and is no longer updated by Apple.

Remove imported photos from iPod

Delete a roll of photos directly from iPod

1. Navigate to the main Menu.
2. Select Extras, then Photo Import.
3. Select the roll name, then Delete Roll, and then Delete.

In iTunes 7 or later

Imported photos can also be deleted from the iPod disk while it is attached to a computer.

1. Connect your iPod to your computer.
2. When the iPod icon appears in the iTunes Source list (below Devices), select it.
3. If the Summary pane isn't showing, click the Summary tab.
4. Click "Enable disk use".
5. All imported photos are located in the "DCIM" folder on the iPod disk.

Remove imported photos from iPod using iPhoto

After you import TIFF images or movie files from an iPod photo into iPhoto with the "Delete items from camera after importing" checkbox selected, the photos and movie files will still appear to be present on your iPod.

iPhoto does in fact delete these files from the iPod, but it doesn't delete the thumbnail files that iPod with color display creates to indicate that you have imported these files into it from your camera or media reader. So although the files will still appear to be in your iPod, they're not. This doesn't happen with other image formats.

Instead of using the "Delete items from camera after importing" iPhoto option to delete photos from iPod with color display, use the Delete Roll function on your iPod to delete the photo and movie files—as well as the thumbnail files—after you've imported them into iPhoto.

Published Date: Oct 10, 2016

iPod photo may seem to stop responding when importing movies

This article has been archived and is no longer updated by Apple.

Your iPod photo may appear to get stuck or stop responding while importing photos and movies from your camera or media reader. Don't worry. Most likely, your iPod is still hard at work.

This apparent situation can happen because iPod photo only generates thumbnails of images that it can display. Since it doesn't display movies, you won't see a thumbnail for a movie as it's being imported; instead you'll see the thumbnail of the previously imported image.

If the movie you're importing is very large, it may appear that your iPod is no longer responding when, in fact, it's still importing the file. Here are some ways you can tell if your iPod is still importing files:

- You will see the progress indicator and the number of items imported update on your iPod.
- The word "Importing" will flash on and off during the photo import.
- If you set your iPod to display the time in the title bar, you will see the time update.

iPod: Understanding Browse Roll icons

This article has been archived and is no longer updated by Apple.

With the latest iPod Software Update you can browse a roll of imported photos on an iPod that works with the iPod Camera Connector (currently iPod photo, iPod with color display, and Fifth Generation iPod), but you may see certain icons displayed instead of a photo thumbnail. Here are the icons you may see and descriptions of what they represent.

Video camera—This indicates that the imported file is a movie. You can't view these movie files on iPod, however, you can view it on your computer after you connect your iPod to your computer and transfer the file. If you select the file on your iPod, you will see the following message: "This media file cannot be viewed or played on iPod. Use QuickTime to open this file on your computer."

Audio—This indicates that the imported file is an audio file. If you select the file on your iPod, you will see the following message: "This media file cannot be viewed or played on iPod. Use QuickTime to open this file on your computer."

Question mark—A question mark (?) in a circle means that the imported image is either not a compatible media type or the image is corrupted. For further identification, you may want to connect your iPod to your computer and locate the file in the DCIM folder. The question mark icon can also appear as a result of the following circumstances:

- You disconnected your camera during a photo import. Please note that the proper way to cancel an import is to select "Stop and Save."
- The iPod or camera ran out of power during a photo import. Make sure that both devices are fully charged prior to using Photo Import.

RAW image—This indicates the file is an unprocessed photo image file. If you select the file on your iPod, you will see the following message: "This photo format cannot be viewed on iPod. Transfer imported photos to your computer and synchronize through iTunes to display them on iPod."

Click here for more information on how to use the iPod Camera Connector.

Safari 2.0: Changes to the keyboard shortcuts for selecting tabs

This article has been archived and is no longer updated by Apple.

In Mac OS X 10.4 Tiger, Safari 2.0 has new keyboard shortcuts for selecting tabs. The new keyboard shortcut for Select Next Tab is Command-Shift-right bracket (]). The shortcut for Select Previous Tab is Command-Shift-left bracket ([).

Note: Because `Shift-]` results in `}`, you may also see this key combination abbreviated to the form "Command-}", as it appears in the Window menu in Safari.

The original combinations, Command-Shift-left arrow (←) and Command-Shift-right arrow (→), still work except in these two situations: Your keyboard focus is in a text field, or you switch to a blank tab. Be sure to use the new method in these situations.

About Safari International Domain Name support

This article has been archived and is no longer updated by Apple.
Security Update 2005-003 updates Safari's support for International Domain Names (IDN) to prevent lookalike characters from being used to spoof the URL displayed in the address field, SSL certificate, or status bar. Here's more information about IDN support in Safari and how Security Update 2005-003 affects it.

The Issue

Safari can display Unicode characters in URLs, allowing you to access foreign language websites using their native language. For example, you could enter the Japanese language URL "�?島.jp" to visit the website instead of using the Latin alphabet that represents that domain name to get there.

However, lookalike characters could be used to make users believe that they are viewing a different site than what they actually are. For example, the Cyrillic letter "a" could be used in place of the Latin letter "a," making it difficult for a user to tell if they are at "www.apple.com" or a malicious imposter website that's designed to look like the real one. These sites can be used to collect account numbers, passwords, and other personal information. This can affect any web browser with support for International Domain Names. Security Update 2005-003 addresses this issue.

The Solution

Security Update 2005-003 provides a user-editable list of scripts that are allowed to be displayed natively in domain names. The default list does not include Latin lookalike scripts (Cherokee, Cyrillic, and Greek) that could be used to trick users into navigating to malicious sites.

Domain names containing scripts that are not in the allowed list will be displayed in an ASCII format called "Punycode." For example, an imposter website with the URL "http://www.apple.com/" that uses the Cyrillic letter "a" would be displayed as "http://www.xn--pple-43d.com" for your protection. This conversion prevents disabled scripts from being confused with other scripts.

You can edit the list of allowed scripts to specify exactly what scripts you want displayed. Please note that adding Cherokee, Cyrillic, and Greek will enable Safari to display all scripts, and will expose you to known IDN vulnerabilities. If you have an empty list of scripts, all non-ASCII characters will be displayed in their Punycode equivalents.

You can modify the list of allowed scripts using any text editor as long as you have administrative access. This list is located at:

/System/Library/Frameworks/WebKit.framework/Versions/A/Resources/IDNScriptWhiteList.txt

QuickTime 6 for Windows: QuickTime Player unexpectedly quits when selecting Hot Picks

This article has been archived and is no longer updated by Apple.

If you are using QuickTime 6 for Windows and you have modified QuickTime Player Preferences so that the "Open movies in new players" option is not selected, QuickTime Player may unexpectedly quit when you click the Hot Picks button.

To prevent this, reselect the "Open movies in new players" option in QuickTime Player Preferences.

Logic Pro 7: Node drops offline when loading an Ultrabeat Kit

This article has been archived and is no longer updated by Apple.

If an Ultrabeat kit that contains samples is assigned to a node, the connected node may drop offline after the samples are loaded, and an error dialog may appear, indicating that the connection to the node has been lost.

This issue only occurs on systems using 100-Megabit Ethernet for node connections. The system requirement for nodes in Logic Pro specifies Gigabit Ethernet for Distributed Audio Processing. When assigned to a node, Ultrabeat will only work reliably when both the master and node computers are Gigabit Ethernet-enabled. Applicable network hardware (such as switches or hubs) must also be Gigabit-enabled.

Final Cut Pro: Modifications to Photoshop layers may cause unexpected scaling

This article has been archived and is no longer updated by Apple.

If a layered Photoshop image (.PSD) is imported into a Final Cut Pro project, and then later modified in Photoshop (via Final Cut Pro's Open In Editor command), changes made to a layer's content may appear to be the wrong size or aspect ratio when viewed in Final Cut Pro. This can happen with Photoshop layers that are partially, or mostly empty.

When Final Cut Pro first imports a layered .PSD file, it evaluates each layer in the file to determine how it should be handled. One part of this evaluation process sets the boundary size for the layer. Although the .PSD file might have an image size of 1280 X 720, a layer in that file might have visible content which covers only a portion of that area. Final Cut Pro sets the boundary size for each layer based on the extent of visible image content in that layer.

If the Open In Editor command is used to make changes to the .PSD file, Final Cut Pro can update the project to reflect those changes, but the boundary size for a layer remains fixed. Changes made to the layer in Photoshop will be scaled in Final Cut Pro to the same dimensions that described the visible extent of that layer when it was originally imported.

The following images illustrate how layer content might be unexpectedly scaled after modification.

This image shows an imported two-layer Photoshop file in Final Cut Pro's Canvas, displayed in Image+Wireframe mode. The wireframes show that the white background on track 1 takes up the full area of the Canvas. The green circle is a layer in the .PSD file, and its wireframe shows that its boundary describes a square which encompasses just the circle.

This image shows the same .PSD file after being sent from Final Cut Pro to Photoshop via the Open in Editor command. The red circle has been added to the same layer which contains the green circle.

This image shows what happens after the file is saved in Photoshop. Upon return to Final Cut Pro, the layer is updated to reflect changes, but the layer's boundary size and shape are not updated. The boundary which described the extent of the layer's visible content at the time of its import now contains the modified visible extent of the layer.

To compensate for the scaling behavior in this scenario, you can use Final Cut Pro's wireframe handles in the Canvas, or Motion parameters in the Viewer to adjust size, aspect ratio and position. If that's not sufficiently precise, you can prevent the scaling by predefining the extent of the layer's visible content in Photoshop before you import the .PSD file into Final Cut Pro. Since you probably don't want to compromise the look of your project, consider a method such as the one outlined below to unobtrusively predefine the boundary of the layer's content.

Example

1. In Photoshop, select the layer and select a single pixel in a corner of the image. (i.e., the absolute, upper left-hand corner of the image).
2. Fill the pixel with a color that will match as closely as possible the background color in your project.
3. Set the pixel to have 1% opacity.
4. In the diagonally opposite corner, set another pixel the same way.
5. Create the rest of the layer as you normally would, or use this as a template.

These steps will define the boundary of the layer's visible area to be the the entire area - the same as the image's dimensions. If content is added to the layer after being imported into Final Cut Pro, the scaling described above will not occur. And because the pixels are in the far corners of the image, and are 99% transparent, they should be hard to detect by viewers (and will also be in the overscan area, and thus unseen on standard televisions).

Note: Avoid creating additional layers in a .PSD file that has already been imported into a Final Cut Pro Project.

TA22999_Final_Cut_Pro_Modifications_to_Photoshop_layers_may_cause_unexpected_scalin

For more information about using .PSD files in Final Cut Pro, please refer to Final Cut Pro Help.

This document will be updated as more information becomes available.

Logic Pro 7: Audio artifacts when using Pitch Correction

This article has been archived and is no longer updated by Apple.

When you use the Pitch Correction plug-in on audio tracks that have sudden large changes in pitch, the plug-in may introduce audio artifacts if the Pitch Correction "Response" parameter is set to respond too fast. To resolve this issue, try lowering the Response setting until the artifacts are no longer audible.

Shake: Motion projects are ignored in Render Disk FlipBook

This article has been archived and is no longer updated by Apple.

If an imported Motion project is included in a Shake script, and you choose Render Disk FlipBook, the Motion project contents will not be included in the resulting Disk FlipBook. Other nodes will be rendered appropriately, but the Motion node will not be rendered.

As a workaround, choose Render FlipBook instead, or output the node tree using a FileOut node.

Logic Pro 7: Grooveshifter causes a track‘s initial audio to fade in

This article has been archived and is no longer updated by Apple.

When you insert the Grooveshifter plug-in on a track, it causes the track's initial audio transient to fade in over a period of a second or so, rather than play with its normal attack. Playback is normal from that point onward, even when cycling.

This happens because Grooveshifter needs to be "primed" with audio before it can play, which causes the initial bit of audio fade in. You can compensate for this by choosing **File > Song Settings > Audio**, then turning on "Playback Pre-roll." With Playback Pre-roll enabled, the initial audio transient played through the Grooveshifter plug-in will be preserved.

iPod: Compilations menu option in Music menu

This article has been archived and is no longer updated by Apple.

If you have an iPod with a color display (including iPod photo and iPod nano) you can add a Compilations option to the Music menu on iPod to display songs that are part of a compilation. To enable this menu option:

1. Select **Settings** in the main menu.
2. In the Settings menu, select **Compilations** to turn the setting on or off

The Music menu now displays a menu option called Compilations. When you select it, iPod will display all songs that are part of a compilation. If you see songs listed in the Compilations menu that shouldn't be there, or if certain songs are missing from the menu, follow these steps:

1. In iTunes, select a song.
2. From the **File** menu, choose **Get Info**.
3. Click the Info tab.
4. To make the song display as part of a compilation, select the "Part of a compilation" checkbox. To change it so that it's not part of a compilation, deselect this checkbox.

If you have an iPod photo, your iPod may need to be updated with the latest iPod Updater to see the Compilations option.

If you're not sure what iPod model you have you can check here.

Logic Pro 7.1: Follow Tempo setting changes without explanation

This article has been archived and is no longer updated by Apple.

In some situations, regions that you haven't explicitly set to "Follow Tempo" will have this feature enabled. In other cases, regions that had been previously enabled to Follow Tempo are no longer enabled.

Although the Follow Tempo parameter for elastic audio can be enabled and disabled in the Region Parameter box, it's actually a property of the audio file. This means that if you enable Follow Tempo for a region, all other regions derived from the same audio file will also have Follow Tempo enabled. Likewise, if you disable Follow Tempo for a region, all other regions derived from the same audio file will have Follow Tempo disabled.

If you want to have independent control over the Follow Tempo parameter for different regions derived from a single audio file, there are a few methods. You can select the regions that you don't want to follow the tempo, and then choose **Audio > Convert Regions to New Audio Files** from the Arrange window's local menu. The regions will be converted into normal, independent audio files that will not follow the tempo if you change it. This method works best if the song is still in the same tempo that the audio file was originally recorded at; converted audio files will always play at the original recorded tempo.

If you've changed the tempo of the song and wish to "lock" some regions to the new tempo, use the Export Region function instead. Select a region that you want to follow the tempo, and choose **File > Export > Region as Audio File**. Be sure to select the "Add resulting files to Audio Window" checkbox so that the exported region is added to your song. Then drag the region from the Audio window into the Arrange window in place of the original. This file will now play at the tempo that the song was set to at the time of export, rather than the tempo at which the region was originally recorded.

Apple Location Manager: Frequently Asked Questions (1 of 3)

This article contains frequently asked questions (FAQ) and answers regarding Apple Location Manager. Additional Apple Location Manager FAQ articles are listed at the bottom of this article.
This article has been archived and is no longer updated by Apple.
Questions answered in this article:

1. What is the Apple Location Manager?
2. How does the Location Manager work?
3. What are the hardware and software requirements to run Location Manager?
4. How can I obtain Apple Location Manager?
5. How do I install the Location Manager?
6. What if I do not want to install all of the Modules that come with Location Manager? Somehow a module has became damaged, and I only want to install just that Module?
7. What if I decide I want to remove the Location Manager?
8. How do I open the Location Manager? Where is it located?
9. Is there on-line help or an Apple Guide for the Location Manager?
10. How do I create a Location in the Location Manager?
11. What are the capabilities of the different Location Manager Modules?
12. How do I add a Module to a Location that I have created?
13. I created a Location and have added the Modules I want, and do not want to ever change it, can I use the Lock check box in the Get Info window to lock it?
14. I want the Location Manger to ask me which Location I wish to use on startup?
15. I have set the Location Manager's Preferences to always ask for a Location on startup. I turn on my computer and go get a cup of coffee but when I come back I already have the desktop?
16. How do I change to the different Locations I have created?

Question 1: What is the Apple Location Manager?

Answer: Apple Location Manager software makes it easy for PowerBook users to move from one Location to another without having to spend a lot of time manually reconfiguring their computer with every move. The Location Manager allows you to quickly change many settings at one time.

Question 2: How does the Location Manager work?

Answer: Apple Location Manager allows users to assign specific settings for a variety of capabilities including networking, printers, time zone, file sharing, sound, frequently used applications, and even which extensions need to be in use. Once a Location is set up, a user simply selects that Location and the system recognizes the user's preferences for that environment.

For example, a typical PowerBook user might have two Locations, named "Home" and "Office", defined for a single PowerBook. When "Home" is selected, the printer becomes a StyleWriter printer connected via serial port, File Sharing is turned off, and Apple Remote Access and Claris E-mailer are automatically opened. When "Office" is selected, the printer becomes the office LaserWriter, File Sharing is turned on, and the network connection is changed to the correct office Ethernet settings.

Question 3: What are the hardware and software requirements to run Location Manager?

Answer: You must be running 7.6 or greater, and it will only install on a PowerBook. Also, version 2.0.1 is available for use with Mac OS 8.1 and is supported on any Macintosh computer that supports Mac OS 8.1.

Question 4: How can I obtain Apple Location Manager?

Answer: The Location Manager comes preinstalled on some PowerBook units. Check your control panels to see if it is already installed. You may also download it from the Older Software Downloads page of Apple Downloads (search for the link "Macintosh/System/Mac_OS_8.1_Update/Location_Manager_2.0.1.smi.bin"). This file will decompress into a folder named "Location Manager Install" which contains:

- Apple Location Manager Read Me
- Installer
- Install Location Manager
- Tome

For directions on how to install, please read the "Apple Location Manager Read Me" file.

Question 5: How do I install the Location Manager?

Answer: Always use the Installer program to install Apple Location Manager. The software may not work correctly if you try to copy or drag it to the System Folder. For directions on how to install, please read the "Apple Location Manager Read Me" file.

Question 6: What if I do not want to install all of the Modules that come with Location Manager? Somehow a module has became damaged, and I only want to install just that Module?

Answer: The Location Manager Installer supports custom installing. You can choose to install any of the following:

- Apple Location Manager control panel
- All the Location Manager Modules or you can click on the arrow and chose to install any of the following:
  - Auto-Open Item
  - Default Printer
  - Extensions Manager
  - File Sharing
  - Network
  - Sound
  - TimeZone
- Control Strip Module for Location Manager
- Location Manager Apple Guide

Question 7: What if I decide I want to remove the Location Manager?

Answer: The Installer also has a Custom Remove. You may choose this option by using the pop-up menu in the top left hand corner in the Location Manager Installer.

Question 8: How do I open the Location Manager? Where is it located?

Answer: You can access the Location Manager through the control panels in the Apple Menu, or by using the Location Manager's Control Strip.

Question 9: Is there on-line help or an Apple Guide for the Location Manager?

Answer: Yes, the Location Manager has both Balloon Help, and an Apple Guide. To access either of these use the Guide menu in the right hand side of the menu bar and select either Show Balloons or Mac OS Guide. Also you can bring up the Location Manager's Apple Guide by clicking on the yellow question mark in the top right hand corner of the Location Manager window.

Question 10: How do I create a Location in the Location Manager?

Answer: Open the Location Manager. In the Location Manager window click the New button on the right hand side. It will bring up a new "untitled" window. Type in a name for this Location in the "Location Name" field. Then select "Save Location" in the File menu. It will rename the window to what you typed in the "Location Name" field. You can also see the "How do I create a new location?" in the "How do I" topic area of the Location Manager Guide, available by clicking on the yellow question mark in the top right hand corner of the Location Manager window. Note: To avoid confusion, do not use the name "None (off)" for a location you create with Apple Location Manager. This is the phrase you use to turn off Location Manager or to select none of the existing locations in the control panel's pop-up menu.

Question 11: What are the capabilities of the different Location Manager Modules?

Answer: Overview of the Modules that come with Location Manager 1.0.

- Auto-Open Item
  This Module will open a file or program automatically when you change to a Location that contains this Module. When you add this Module to your Location it brings up an Open Dialog box for you to choose the application or document you wish to have opened. Select the file or program you wish to Auto-Open and then click the Add button in the middle of the window. To open more than one item when changing to a Location, add this Module multiple times.
- Default Printer
  Choosing this Module will change the default printer. To use this Module select the printer you wish to have in the Chooser and then add the Module Default Printer. For instructions on how to change your default printer, see "How do I print?" in the "Printing" topic area of the Mac OS Guide, available in the Guide menu.
- Extensions Manager
  This Module changes the extensions that are to be in effect for this Location. Before trying to add this Module, create a Set inside the Extensions Manager control panel for the Location you will be using. (See note below)
- File Sharing
  This Module will turn File Sharing on or off. First set the Sharing Setup control panel to the state you wish to save with this Location. For instructions on how to set the Sharing Setup control panel, see "How do I give others access to my files?" in the "Sharing Files" topic area of the Mac OS Guide, available in the Guide menu. Then open a Location and add this Module.
- Networking
  This Module will switch between Configurations of the AppleTalk and TCP/IP control panels only. This Module will not allow you to save a setting named "Default". You will need to use the AppleTalk and TCP/IP control panels to create multiple Configurations prior to saving the current setting with Location Manager. NOTE: It is usually best to name these Configurations after the Location you will be using it in, and not after what the Configuration changes. Choose names like "Office" or "Home" instead of "Ethernet". This way when the computer reports it is changing to the configuration "Ethernet" and for some reason this Configuration has been set to change the AppleTalk control panel to

the Printer/Modem port it will not be so confusing. For instructions on how to create these settings in the AppleTalk and TCP/IP control panel, see "How do I change AppleTalk settings all at once?" and "How do I change TCP/IP settings all at once?" in the "Networks" topic area of Mac OS Guide, available in the Guide menu. NOTE: The current version as of this writing (which is 1.0) of this module is not capable of changing to different Configuration of the PPP control panel that is part of OT/PPP.

- Sound
  This Module saves and restores the volume level for sound out on the computer. For instructions on how to change the sound volume, see "How do I adjust the speaker or headphones?" in the "Sound" topic area of the Mac OS Guide, available in the Guide menu.
- Time Zone
  This Module will save the settings of the Date & Time and Map control panels. Use the Date & Time control panel to change your time zone. Use the Map control panel if you wish to set your Location to somewhere that isn't in Date & Time. For instructions on how to change these control panels, see "How do I set my Location?" in the "Customizing Your Computer" topic area of Mac OS Guide, available in the Guide menu.

Note: It is usually best to name this Set after the Location you will be using it in, and not after the Set changes. Choose names like "Office" or "Home" instead of "7.6 Only". You can do this by going into the extensions manager and selecting the Duplicate button in the bottom right hand corner, it will ask you to name the set. You can also see "How do I manage System Folder extensions?" in the "Customizing Your Computer" topic area of Mac OS guide, available in the Guide menu. Then change this new set to have the extensions you want. Leave this set active and then when you go into the Location Manager and Add the Module Extensions Manager it will add this set. This Module only captures the name of the extensions set. If you use the Extensions manager control panel to alter the contents of a set, you do not need to update this Module. When you change to a different Location that changes the Extensions Set you will be given the option to Restart the computer to activate this new set of extensions.

Question 12: How do I add a Module to a Location that I have created?

Answer: After you have created a Location, you can add a Module by clicking on it and then selecting the Add button. Make sure you have the settings for this module set the way you want, before adding it. Some Modules require that you create a configuration with the settings that you wish before adding them, such as the Extensions Manager Module or the Networking Module.

Question 13: I created a Location and have added the Modules I want, and do not want to ever change it, can I use the Lock check box in the Get Info window to lock it?

Answer: The Location Manager can not use Locked Locations or Locations on a locked volume and will ignore them.

Question 14: I want the Location Manger to ask me which Location I wish to use on startup?

Answer: Under the Edit menu, while the Location Manager is the active application, you can select Preferences. In this dialog box you can change the Startup Switching preference. You may select to have the Location Manager at startup ask you to select a Location:

- Never
- Always
- If I hold down the spacebar

Question 15: I have set the Location Manager's Preferences to always ask for a Location on startup. I turn on my computer and go get a cup of coffee but when I come back I already have the desktop?

Answer: The Location Manager will only display this dialog box for a few minutes, and if you do not change it, will leave the currently selected Location as the active one and continue the startup process.

Question 16: How do I change to the different Locations I have created?

Answer: You can change from one Location to another several ways. You can use the Location Manager control strip module. It looks like two foot prints. You can go to the control panel Location Manager and use the pop up menu "Current Location" to change to a different Location. You can also set Location Manager's preferences, located in the Location Manager's Edit menu, to have it either always ask for you to select a Location on startup, or if you hold down the spacebar it will bring up a dialog box asking you to choose a Location.

Mac OS X 10.4 Tiger: "Connection failed" error when connecting to an AFP server

This article has been archived and is no longer updated by Apple.

Apple Filing Protocol (AFP) service is known by several names, including File Sharing, Personal File Sharing, AppleShare, and Apple File Service. Some AFP servers can only share over the AppleTalk protocol; they don't offer sharing over TCP/IP, which is now the preferred protocol. If you try to connect to an AppleTalk-only AFP server from a Mac OS X 10.4 Tiger computer, this message will appear:

> "Connection failed. This file server uses an incompatible version of the AFP protocol. You cannot connect to it."

This happens because Tiger no longer supports connecting to AFP over the AppleTalk protocol.

As a solution, enable the TCP/IP protocol on the AFP server if it offers this option. If no TCP/IP option is available, connect to the Tiger computer from the computer that is the AppleTalk-only AFP server (instead of trying to connect from the Tiger computer to connect to the older computer). This method works because AppleShare client software on the older computer can connect to a Tiger computer over TCP/IP, even if it can't offer service over TCP/IP.

This may also affect third-party AFP server products. Be aware that some affected AFP servers have a TCP/IP option, but others don't.

Some AFP services that *do not* have a TCP/IP option include Personal File Sharing in Mac OS 8.6 and earlier, and the AppleShare server suite. Some AFP services that *do* have a TCP/IP option include Mac OS 9 File Sharing, and the AppleShare IP server suite.

Mac OS X Server: Join Kerberos dialog may show incorrect information

This article has been archived and is no longer updated by Apple.

In Server Admin, if you click the Join Kerberos button immediately after configuring Directory Access to bind to a directory system (such as Active Directory), the Join Kerberos dialog may appear blank or contain incorrect prompts, such as a request for Kerberos realm or DNS server.

Some of the required network information takes a moment to populate after binding to a directory system, so you can avoid the issue by simply waiting 30 to 60 seconds before clicking the Join Kerberos button.

Logic Pro/Express 7.1: Issues with Follow Tempo when opening GarageBand songs in Logic

This article has been archived and is no longer updated by Apple.

When you open GarageBand 2 songs in Logic Pro 7.1 or Logic Express 7.1, there are some differences in how Follow Tempo will work with audio tracks, depending on whether the song was created in GarageBand 2.0 or 2.01.

Audio recorded directly in Logic 7.1 can follow subsequent tempo changes or changes to the Project Key (initial key signature). Likewise, audio recorded in GarageBand 2.0 or later can also follow tempo and key transpositions when the song is opened in Logic 7.1. However, there are a couple of important differences in how this is achieved.

Songs created in GarageBand 2.0

When you open a GarageBand 2.0 song in Logic 7.1 and enable the Follow Tempo feature in the Region parameter box, this allows the audio files to follow tempo changes in Logic, but it doesn't allow them to follow the project key. If you want to transpose audio that was originally recorded in GarageBand 2.0, use the Transpose parameter that appears in the Region Parameter box after you enable Follow Tempo.

Set the Transpose value to whatever number of semitones is necessary for the audio to play in the same key as the Logic song. In the picture above, we transposed our audio up two semitones to change the key from C to D.

Songs created in GarageBand 2.01 or later

When you open a GarageBand 2.01 or later song in Logic 7.1 and enable the Follow Tempo feature, this allows the audio file to follow tempo changes and the project key in Logic. To make audio recorded in GarageBand 2.01 play in the same key as the Logic project (no matter what key it was originally recorded in), just set the initial key signature in the Signature track to the same one you're using in Logic. The audio will automatically be transposed to the proper key.

Published Date: Feb 19, 2012

GarageBand 2.0 song does not automatically follow key change

This article has been archived and is no longer updated by Apple.

When you record a song in GarageBand 2.0.1 or later, all tracks automatically follow any subsequent changes you make to both the key and tempo. However, a song recorded in GarageBand 2.0 will only follow tempo changes—not key changes.

You can easily transpose a GarageBand 2.0 recording to a new key by following these steps:

1. Select an audio recording in the song.
2. Click the Edit button to open the Audio Editor.
3. Set the Region Pitch slider to the number of semitones needed to transpose the region to the song's new key.

   In the example above, we transposed our audio recording up two semitones to change the key from C to D.
4. Repeat for each audio recording in the song.

Final Cut Pro 5 will not open without QuickTime 7

This article has been archived and is no longer updated by Apple.

If Final Cut Pro 5 won't open after you install it, be sure that you have QuickTime 7 installed. QuickTime 7 is required to run Final Cut Pro 5. To see what version of QuickTime you have:

1. Open QuickTime Player.
2. From the **QuickTime Player** menu, choose **About QuickTime Player** to open the About window.

Your QuickTime version number is displayed in the About window. You can download the latest version of QuickTime from here.

For more information on Final Cut Pro requirements, please see "Technical Specifications for Final Cut Pro."

Final Cut Pro: Notes for setting Scratch Disks on Xsan

This article has been archived and is no longer updated by Apple.

This document discusses setting Final Cut Pro's Scratch Disk folders for multiple users on an Xsan volume. Numerous configurations are possible, but planning the Scratch Disk settings is an important consideration, as it may seriously affect the way that Final Cut Pro is able to access resources on Xsan.

- **Don't designate the root level of the Xsan as a Scratch Disk.**
  In general, the root level of the Xsan volume should be write-prohibited for Final Cut Pro users. If you do designate the root level of the volume as Scratch Disk, other users may see an alert message when opening Final Cut Pro that says:

  > "Unable to set scratch disk. The selected directory is on write-protected or non-writable media."

- **Don't share the same Scratch Disk location between two or more users.**
  Ideally, each user should have a unique folder on the Xsan volume that will act as Final Cut Pro's Scratch Disk for that user. Permissions for a user's folder should be set to allow that specific user to have read/write access. While it is possible for multiple users to share a Scratch Disk, Apple advises against this configuration, as it may lead to unexpected behaviors.

- **If using Final Cut Pro 6.0.1 and earlier, use POSIX. If using Final Cut Pro 6.0.2 and later, use an Access Control List (ACL).**
  If you use an ACL to designate a folder's privileges with Final Cut Pro 6.0.1 and earlier (including Final Cut Pro 5.x), it might not perform as expected if set as a scratch disk, or may not be configurable as a scratch disk.

  Instead, for example, if you want to make a user's Capture Scratch folder readable, but not writable by other users, do so with standard UNIX file permissions, as opposed to an ACL.

If a user on the Xsan has set the Scratch Disk location to a shared folder, and other users are subsequently unable to open Final Cut Pro, or make changes the Scratch Disk location, delete the Final Cut Pro preferences for affected users, and then set the Scratch Disk in accordance with the guidelines listed above.

For more information on the topics discussed here, refer to the Final Cut Pro User's Manual, and to the Xsan Admin Guide.

This document will be updated as more information becomes available.

Motion 1: Changing audio sample rates could cause audio not to play

This article has been archived and is no longer updated by Apple.

If your computer's audio output was set to a particular sample rate when you created a Motion project and then you change that sample rate, you may not be able to hear your project's audio tracks when you open it. This can happen even when the audio tracks and waveforms are properly displayed.

This issue can occur with both your computer's built-in audio outputs and third-party sound cards.

For example, let's say you set the Digital Out/Headphones source in Audio MIDI Setup to 44.1 KHz. Then you create a new Motion project, do some work with graphics and audio, and save it. If you go back to Audio MIDI Setup and change the Digital Out/Headphones source to 48 KHz, the next time you open your Motion project, the sound won't be audible.

To correct this, you can edit the project file:

1. Close your Motion project.
2. Make a backup of your Motion project file.
3. Open your original Motion project with TextEdit (you can just drag the project onto the text edit icon in the Dock or your applications folder.)
4. Find in the document (Command-F will bring up the Find window).
5. Look for a line that begins with <audioSampleRate> .
6. Select and delete the entire <audioSampleRate> line (see illustrations below).
7. Save the changed Motion project file.
8. Open your project in Motion and confirm that you can now hear audio.

Audio MIDI Setup is where you can configure the audio input and output settings on your computer. Click here to learn more about Audio MIDI Setup.

Note: There may be a second entry of <audioSampleRate> under <exportSettings>. This should be left in the project file.

This document will be updated as more information becomes available.

This issue does not occur in Motion 2.

iPod photo: Unexpected slideshow behavior after upgrading to 1.1

This article has been archived and is no longer updated by Apple.

After upgrading iPod photo from 1.0 to 1.1, you may experience certain unexpected slideshow behavior. This may occur if you do not connect iPod photo to iTunes 4.7.1 after upgrading.

One or more of the following may occur:

- Certain transitions, such as "Push Across", do not work during a slideshow.
- Selecting Random transitions does not work as expected.
- A black screen may occur during slideshow.
- Photo colors do not appear correctly and may look like "abstract art."

The solution is to connect iPod photo to iTunes 4.7.1 after upgrading iPod photo from 1.0 to 1.1. Allowing iTunes to update your photo library on iPod photo should keep this issue from occurring. Restoring iPod photo software 1.1 instead of upgrading from 1.0 to 1.1 should also prevent this from occurring.

Removing a Palm OS device from the iSync device list

This article has been archived and is no longer updated by Apple.

Before you remove a Palm OS device from your iSync device list, make sure that the Palm HotSync application isn't running. If it is, quit it, then remove the Palm device in iSync. Otherwise, the Palm device may reappear in iSync.

If you decide you want to add the device back again later:

1. Open HotSync.
2. From the HotSync menu, choose Conduit Settings.
3. Select the iSync Conduit in the list.
4. Click the Conduit Settings button.
5. Select "Enable iSync for this Palm device".

The Palm device icon should now appear in the iSync window.

iSync phone syncing issue may be related to third-party software

This article has been archived and is no longer updated by Apple.

If you are having issues syncing your phone with iSync (for example, you may experience unexpected disconnections), temporarily disable any third-party software on the phone. The software may be trying to read or write to the same contacts or calendar data as iSync, which can cause the disruption.

Some such applications include PocketTorch AquaCalendar, and Sony Ericsson Desktop (available on Sony Ericsson P900 series phones).

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X 10.3 or later: System won‘t restart after installing SUIExtras.pkg

This article has been archived and is no longer updated by Apple.

If you install the SIUExtras.pkg on Mac OS X 10.3 or later, it will prevent your system from restarting.

This package is used by System Image Utility for creating Mac OS X 10.3 NetInstall images; it's not meant to be installed under any circumstances. The package's `/etc/rc.cdrom` file is the item that prevents your computer from restarting because it tries to force the Installer to launch. You can resolve this issue by removing the file as follows:

1. During startup, press and hold Command-S to start up in single-user mode.
2. Type each of the following commands, pressing Return after each one.
   Warning: Be sure to type the commands exactly as they appear below. Misusing the "rm" command can cause unintended data loss.

```
fsck -yf
mount -uw /
rm /etc/rc.cdrom
exit
```

After performing these commands, the system will restart normally. The package also installs files at /System/Installation/CDIS and /Applications/Utilities/Startup Disk.app. You can delete these in the Finder after the system starts up.

Mac OS X Server: Migrate data from NetInfo to LDAP only on a NetInfo master

This article has been archived and is no longer updated by Apple.

If you want to migrate data from NetInfo to LDAP, you must do this on the NetInfo master. To verify that the system you are upgrading on is not a clone, execute this command in Terminal:

```
nicl .. read /
```

This displays the master property. Here's an example:

```
master: xserver/network
```

The first part of the master property is the host name. This is the system on which you need to perform the migration. You can find this system's IP address by entering the following command in Terminal, where <master> is the name of your master:

```
nicl .. read /machines/<master>
```

In our example command above, we got the following output:

```
nicl .. read /machines/xserver name: xserver ip_address: 10.1.1.100 serves: ./network xserver/local
```

Therefore, our system at IP address 10.1.1.100 is the master in this case. This would be the system on which we'd perform our migration. Do the same, noting your variables accordingly.

iSync: Can‘t initiate session with Motorola phone via USB

This article has been archived and is no longer updated by Apple.

Are you having trouble syncing your Motorola phone with iSync via USB? If you look at the sync log, you may see a message stating that iSync "Can't initiate session."

To resolve this issue, try disconnecting the phone's USB cable from your computer, then reconnecting it and syncing again.

iSync 2: Uppercase letters in phone numbers get converted to numbers

This article has been archived and is no longer updated by Apple.

When you sync a phone with your computer using iSync 2 (part of Mac OS X 10.4 Tiger), any Address Book phone number that contains uppercase (capital) letters will be automatically converted into all numbers on your phone.

For example, if you have the phone number 800-555-CALL in Address Book and then use iSync 2 to sync contacts with your phone, the phone number will show up as 800-555-2255 when viewed on your phone.

iSync translates uppercase letters into numerals so that the dialing feature works with some phones. Please note that lowercase letters are not translated because some phones use lowercase letters for commands (for example, the letter *p* is used to pause on some phones).

AirPort: Wired client cannot initiate base station modem dialing

This article has been archived and is no longer updated by Apple.

If you use the built-in modem on your AirPort base station to connect to a dial-up Internet Service Provider (ISP), you must initiate the connection attempt from a wireless client. Clients that are connected to the base station LAN port over Ethernet cannot trigger modem dialing.

After the dial-up connection is established, wired clients will be able to use the connection; they just can't start it when the connection is not already open.

This issue affects all AirPort and AirPort Extreme base station models with a built-in modem.

Published Date: Feb 18, 2012

iSync 2: "iSync Agent" error appears when setting up a phone for syncing

This article has been archived and is no longer updated by Apple.

If you have less than 300k of memory available on your Symbian OS-based phone when you try to set it up in iSync 2 (included with Mac OS X 10.4 Tiger), you'll get the following error message:

> "An error occurred while copying iSync Agent to your phone. iSync could not copy iSync Agent to your phone. Please check the following: Your phone is turned on. Bluetooth is turned on on your phone."

Symbian OS-based phones (such as the Sony Ericsson P800 or P900, Nokia 3600, Nokia 3620, Nokia 3650, Nokia 3660, Nokia 6600, Nokia 7650, and Nokia N-Gage) need at least 300k of memory available for iSync 2 to set them up for syncing. A good way to make more memory available on your phone is to delete pictures, sounds, movies, or other applications that you don't want anymore (check the documentation that came with the phone for more information).

After making at least 300k of memory available, turn the phone off and back on again, then use iSync 2 to set it up for syncing.

If you're not sure what type of OS your phone uses, check the documentation that came with it to find out whether it's a Symbian OS device or not.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

About Xsan 1.0.1 Update

This article has been archived and is no longer updated by Apple.

The Xsan 1.0.1 update delivers improved reliability and compatibility for Xsan 1.0, and is recommended for all users of Xsan. For tips on using an update, see Upgrading Xsan Controller Software.

Enhancements

- Use the "mv" command to move files from Xsan (ACFS) to Mac OS Extended (HFS+) volumes.
- Save files over 4 GB via SMB/CIFS to an Xsan volume hosted on Mac OS X Server.
- Greater server stability when resharing Xsan volumes via NFS.
- Eliminates spontaneous metadata controller failovers that can result in decreased file performance.

System Requirements

- Any hardware supported by Xsan 1.0
- Xsan 1.0
- Mac OS X 10.3.9 or Mac OS X Server 10.3.9

Published Date: Oct 10, 2016

About the Xsan 1.1 Updates

This article has been archived and is no longer updated by Apple.

There are three different software updates available for Xsan 1.1. These updates apply to Mac OS X client and Server versions 10.3.9 and later.

Installation

The following updates are available for Xsan 1.1, which can be installed using Software Update or by downloading a standalone update installer from Apple Downloads:

- Xsan 1.1 Update for 10.3.9
- Xsan 1.1 Update for 10.4
- Xsan Admin 1.1 Update

Of the first two, you only need to install the one that corresponds to your operating system version (an upgrade scenario is an exception). The third is required for Xsan 1.1 administration (and is also recommended for Xsan 1.0 administration) but only needs to be installed on admin computers.

Software Update Installation
Software Update may have referred you to this document. For more information on using this feature, see "Mac OS X: Updating your software."

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer
A standalone installer is also available from Apple Downloads .

Remote Installation
If you need to install the update on a remote computer, you can do so using the "softwareupdate" command-line tool.

Enhancements

The following items are some of the enhancements and improvements included in each Xsan 1.1 update:

Xsan Admin 1.1 Update
This update improves reliability for remotely administering, configuring, and maintaining Xsan 1.1 deployments. It includes fixes for:

- Labeling Fibre Channel LUNs and creating new Xsan volumes.
- Displaying progress messages while performing lengthy operations.
- Preventing manually modified configuration settings from being overwritten during a save.
- Accurately reporting Fibre Channel multipathing errors.
- Lock View command in Xsan Admin 1.1 can now monitor a SAN from an unsecured computer without the risk of a passerby mounting, unmounting, starting, or stopping volumes, or otherwise changing the SAN configuration.
- Improvements to email notifications will now alert you if the Xsan software serial number on a controller or client is about to expire.
- Now allows the use of site-licensed product license keys (serial numbers).

Xsan 1.1 Update for 10.4.1 or later
This update improves reliability for Xsan, and is required for all systems with Mac OS X 10.4.1 or later. It includes fixes for:

- Using Xsan on computers with Mac OS X and Mac OS X Server versions 10.4.1 or later.
- Providing metadata controller services to Mac OS X 10.3.9 or later systems with Xsan 1.1.
- Accessing Xsan volumes larger than 16 terabytes in size (up to 1024 terabytes).
- Greater server stability when resharing Xsan volumes through NFS.
- Handling quotas with no associated user or group name.
- Maintaining access to Xsan volumes when metadata controller failovers occur.
- Operating Xsan in environments with a mix of Mac OS X 10.3.9 and 10.4 systems.

Important: If any client system in your SAN is running Xsan 1.1 on Mac OS X 10.4 or later, then your metadata controllers (MDCs) must also be updated to 10.4 or later. Otherwise, Xsan will not work properly.

Xsan 1.1 Update for 10.3.9
This update improves reliability for Xsan, and is recommended for all systems with Mac OS X 10.3.9. It includes fixes for:

- Greater server stability when resharing Xsan volumes through NFS.
- Handling quotas with no associated user or group name.
- Maintaining access to Xsan volumes when metadata controller failovers occur.
- Operating Xsan in environments with a mix of Mac OS X 10.3.9 and 10.4 systems.

TA23026_About_the_Xsan_Updates.pdf

Documentation

Xsan 1.1 includes new documentation, which you can get here. Be sure to read the Xsan 1.1 Administrator's Guide as well as the Xsan Migration Guide for Xsan 1.1, which includes step-by-step instructions for upgrading from Xsan 1.0 to Xsan 1.1.

Pages 1.0: "Template Could Not be Found" error on French systems

This article has been archived and is no longer updated by Apple.

If you set Pages 1.0 to use the template "En Blanc" as the default template for new documents, you may get a "Template could not be found" or "Impossible de trouver le modle" error when you try to open a new document.

If this happens to you, use these steps as a workaround:

1. From the **Pages** menu, choose **Preferences**.
2. In the "For New Documents" section, select the "Show Template Chooser dialog" radio button.
3. Close the Preferences window.
4. Any time you want to use the En Blanc template, choose **New** from the **File** menu.
5. Select the En Blanc template and click Choose.

iSync 2: Reset Sync History enables calendar and contact syncing

This article has been archived and is no longer updated by Apple.

Learn about the iSync 2 (included with Mac OS X 10.4 Tiger) feature "Reset Sync History."

If you're troubleshooting iSync 2, you might wish to reset the computer's sync history by selecting the Reset Sync History option (in iSync preferences). After this, the computer act as though it is being synced for the first time, and you may be asked to merge or replace information on this computer with information from other devices or computers.

Note: This reset will also enable syncing of all calendars and contacts on all devices, even if that was previously disabled. If after performing a Reset Sync History you don't want to sync calendars and contacts with certain devices, reconfigure each device's settings in iSync.

Motorola phone not in iSync 2 after upgrade

This article has been archived and is no longer updated by Apple.

If you were using an earlier version of iSync before upgrading to iSync 2 (part of Mac OS X 10.4 Tiger), your Motorola phone might not be automatically recognized during the upgrade process, even though iSync 2 asked you to connect it. Here's how to resolve this issue.

Note: This document applies to iSync 2 or later.

1. Connect the phone to your computer and turn it on.
2. From the iSync 2 **Devices** menu, choose **Add Device**.
3. Double-click the phone icon in the Add Device window.
4. Configure the phone's settings however you wish.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Logic Pro/Express 7.1: Crossfade parameters disappear for audio regions

This article has been archived and is no longer updated by Apple.

In Logic Pro and Logic Express 7.1, crossfade settings in the Region Parameter box are not consistently displayed for all audio files. Normally, the Region Parameter box will display several settings for adjusting crossfades in selected regions.

Here are some situations where the crossfade settings in the Region Parameter box will not be available:

- The region you are working with is an Apple Loop. Because you can't apply crossfades to an Apple Loop, no crossfade parameters will display when you select one. Instead, you will see a setting for Transpose.

- You've selected the Follow Tempo checkbox for a recorded region (Logic Pro 7.1 only).

  Because you can't crossfade regions that are set to follow subsequent song tempo changes, the crossfade settings are not displayed, though you will see a Transpose parameter.

If you want to apply crossfades to a loop or region in either of the above situations, export the regions as audio files by doing the following:

1. Select a loop or region and choose **File > Export > Region as Audio File**. Repeat for all other Apple Loops or Follow Tempo-enabled regions that you want to crossfade.
2. Replace each Apple Loop or Follow Tempo-enabled audio region with its corresponding exported region.
3. Select a region and apply crossfades using the settings in the Region Parameter box as you normally would.

Important: Do not make any tempo changes to the song after performing this workaround, as the exported regions will not follow subsequent tempo changes.

Mac OS X Server 10.3 or later: Issues when saving disk image to local volume

This article has been archived and is no longer updated by Apple.

If you save a disk image created in Network Image Utility (Mac OS X 10.3) or System Image Utility (Mac OS X 10.4) to the startup volume, the save process may pause for an extended time and ultimately stop. Cache files that get created when you save the disk image to your startup volume may cause your available disk space to temporarily exceed the space available—sometimes regardless of startup volume size.

To resolve the issue:

1. Open the Network Image Utility or System Image Utility.
2. Configure the image name, type, installation options, disk image source, and any other options you wish.
3. When you're ready to create the disk image, click Create.
4. When prompted to save the disk image, choose a volume other than the startup volume.

iSync: Nameless contacts may be duplicated

This article has been archived and is no longer updated by Apple.

If you create a contact on more than one device that has the same phone number or other contact information but you don't provide a contact or company name with it, you may end up with multiple copies of that contact after syncing.

To avoid this issue, make sure that you have either a contact or company name for each contact on every device so that iSync doesn't duplicate contacts.

Published Date: Feb 18, 2012

iSync: Deleting a contact may not occur on all synced devices

This article has been archived and is no longer updated by Apple.

If you delete a contact from the Address Book of a computer or device and then also modify the same contact on another computer or device, the contact may not be deleted after syncing. iSync won't give you any alert message about the conflict.

If you want to delete a contact, avoid modifying the same contact on other devices before performing the sync. If you did but the contact hasn't been deleted, delete the contact and sync again.

Use care when deleting a contact. Be sure to back up your contacts so that if you inadvertently delete a contact, you can easily recover it. See "Working with vCards" and "Backing up Address Book" for more information.

Installing Mac OS X Server 10.3 on a computer that won‘t start up from the Installation CD

This article has been archived and is no longer updated by Apple.

Some computers that work with Mac OS X Server 10.3 may not be able to start up from the Server Installation CD—the computer may display just a blank, gray screen when you try. For this reason, Apple allows you to use a meta package (.mpkg) file on the CD to install Mac OS X Server over a running Mac OS X 10.3 (client) installation.

Note: Mac OS X Server 10.3 is supported on the Power Mac G5, Power Mac G4, Power Mac G3 (Blue and White), eMac, iMac, and Mac Mini.

To install Mac OS X Server 10.3 from the .mpkg file, do the following:

1. Be sure that all software on the target computer is up to date.
   Note: If you decide to start with a fresh system by doing an erase install (this is *not* required), be sure to complete the Setup Assistant while the computer is connected to your network.
2. Be sure that your computer is connected to your network.
3. Restart the computer.
4. Insert Disc 2 from the retail version of Mac OS X Server 10.3.
5. Open the .mpkg Installer from the disc and follow the onscreen steps.
6. When finished, restart the computer.
7. The Server Assistant appears; use it to complete the set-up, making sure that you configure the computer as a standalone server.
8. Use Software Update to install only the Mac OS X Server 10.3.4 Update (do not install the JBoss update for now).
9. Restart the computer.
10. Go back to Software Update and install all the remaining updates, restarting your computer as necessary.
11. If desired, you can now use Server Admin to set up the server as an Open Directory Master.

This procedure also appears on page 85 of the Getting Started manual, found here.

Logic Pro/Express 7: Converted Apple Loops don‘t play at song‘s tempo or key

This article has been archived and is no longer updated by Apple.

When an Apple Loop is converted into an audio file, the resulting file may not play at the song's current tempo and key settings. Instead, the new audio file will play at the original Apple Loop's tempo and key.

This happens when you select an Apple Loop region and choose **Audio > Convert Regions to New Audio Files** from the Arrange window menu and you change the "file format" parameter in the resulting dialog window from "Original file type" to either Wave or SDII. This creates a copy of the original Apple Loop file, but without the transient and category tags. That means the file will only play at whatever tempo and key the original Apple Loop was recorded at—not at the tempo and key of the song.

Logic Pro/Express 7.2 resolves this issue by enabling the Elastic Audio feature for exported files. When you convert regions to new audio files, the Follow Tempo box will be checked for the new audio files created.

If you want to convert Apple Loops to new audio files that will use the song's tempo and key settings in other audio applications, select the loop (or loops) and choose **File > Export > Region as Audio File**. Though this new file will play at your song's current tempo and key, it can't follow subsequent tempo or key changes like an Apple Loop; it's fixed at the tempo and key that your song was set to when you exported the file.

Syncing requirements for Mac OS X 10.4

This article has been archived and is no longer updated by Apple.

You can sync many different kinds of data and devices with Mac OS X Tiger 10.4. **Note**: Compatible devices are subject to change.

To sync using .Mac

To use .Mac syncing in Mac OS X 10.4, you'll need:

- A .Mac subscription (either full or 60-day trial)
- An Internet connection (dial-up modem or high-speed broadband)

Learn more about .Mac here.

Mobile phone syncing

To sync a Bluetooth mobile phone with Mac OS X 10.4, you need one of the following:

- A Tiger-compatible Mac with built-in Bluetooth, or
- A Tiger-compatible Mac with D-Link DBT-120 USB Bluetooth Adapter

To sync a USB mobile phone (through USB), you need a Mac with built-in USB 1.1 or 2.0 port

Learn more about Tiger-compatible phones here.

iPod syncing

To sync information with an iPod, you need a Mac with a built-in USB or FireWire connection (and, of course, an iPod).

Find out more about syncing devices here.

Palm device syncing

To sync a PalmOS-based device in Mac OS X 10.4, you need:

- A Macintosh-compatible PalmOS device
- Palm Desktop software version 4.2.1 or later

Learn more about Palm devices here.

Logic Pro/Logic Express 7: Plug-in "Save Setting" menu item is dimmed

This article has been archived and is no longer updated by Apple.

You may come across a situation when you try to save a plug-in setting in Logic Pro 7 or Logic Express 7, but **Save Setting** in the plug-in settings menu appears dimmed. This can occur after you load an existing setting or when you try to save a new one.

Tip: The "plug-in settings menu" refers to a nameless menu represented by a triangle, as seen in this image.

Here's how to save your plug-in settings in each of these circumstances.

1. If you opened a plug-in, adjusted some parameters, and are saving the setting for the first time, choose **Save Setting as** from the plug-in settings menu since there is no existing setting file to save to. Once you save the setting, you can then open it anytime, make changes, and choose **Save Setting** to save subsequent changes.
2. If you loaded one of Logic's factory settings, you won't be able to modify the settings directly. If you wish to modify one, choose **Save Setting as** from the menu to create an editable copy of the settings file. You can then edit the settings and save them using the Save Setting option.

Helvetica Fractions font may cause text to display improperly in Address Book, iChat, Safari, Mail

This article has been archived and is no longer updated by Apple.

If you have the Helvetica Fractions font installed, text in some applications (including Address Book, iChat, Safari and Mail) may appear as overlapping numbers and symbols.

To avoid this issue in Mac OS X 10.3 and later, use Font Book to turn off the Helvetica Fractions font.

If you're using Mac OS X 10.2.8 or earlier, check these two font locations for the Helvetica Fractions font:

- /Library/Fonts/
- ~/Library/Fonts/ (the tilde represents your Home folder)

If you find a Helvetica Fractions font (or fonts), which may appear as "HelveFra" or "HelveFraBold," remove it from the folders. (To avoid other issues, do not disable the Helvetica font.)

iMovie: Adding effects to a clip with titles may make it become gray or tinted

This article has been archived and is no longer updated by Apple.

If you apply a title to a clip in iMovie 4 or 5 and then add an effect to the same clip, it's possible that the clip may unexpectedly become gray or tinted with the same color as the title text after the effect finishes rendering.

For example, if you add a title using the default white text and then add an effect, the clip might look white or gray. If your title text is blue and you add an effect, you might see that the effect and the clip have taken on a blue tint. This only happens if you use certain combinations of titles and effects.

If this happens to one of your clips after you add an effect, try these steps as a workaround:

1. Undo the effect: From the **Edit** menu, choose **Undo** (or press Command-Z).
2. Save your iMovie project.
3. Quit iMovie.
4. Open iMovie.
5. Add the desired effect back to the clip.

The effect should render normally at this point without causing any color shifts. If it's too late to undo the effect, you can either restore the clip back to its original form (from the **Advanced** menu, choose **Revert Clip to Original**), or bring a fresh version of the clip into the timeline.

This document will be updated as more information becomes available.

Keynote: Bullets do not appear as expected in exported Flash file

This article has been archived and is no longer updated by Apple.

When you export a Keynote presentation to Flash, you may notice that image bullets appear as simple text bullets. This happens because Flash does not support image bullets; all image bullets in a Keynote project will be replaced by text bullets when you export it to Flash.

Note: Please be aware that many of the slide themes in Keynote use image bullets as a default.

Click here for more information on formatting a bulleted list.

Mac OS X Server 10.3: NetBoot images don‘t include all packages by default

This article has been archived and is no longer updated by Apple.

Like a default installation of Mac OS X 10.3 Panther, a NetBoot installation image only includes the essential packages by default.

When you create a NetBoot image from Mac OS X 10.3 client installation discs on a 10.3 server, the image will contain the default selection of packages from the first two Panther discs. If you would like to add more than the default packages to the image, including the packages found on the third Panther disc, you'll need to create a custom image.

To do this, while in Network Image Utility, click the Contents tab, then click the Customize button (this button appears when you choose a CD or DVD from the **Image Source** pop-up menu). A dialog sheet appears, and offers various checkboxes for you to select the packages you want to include.

iDVD: Not all operations are shown in the progress bar

This article has been archived and is no longer updated by Apple.

When you burn a DVD in iDVD, some operations may not be displayed in the progress bar during the process. Sometimes the progress bar doesn't indicate specifically what process is taking place or how long it has to go, which can make it appear as if the process has stopped.

You may notice this more when iDVD is encoding audio or multiplexing, where the progress window may display a "Writing Lead-in" message for a long time (from 5–10 minutes, depending on your content, which can seem like an eternity when you're anticipating that first DVD screening). Don't worry. iDVD is still hard at work—it just won't give you every detail of its progress.

Mac OS X 10.4: Mail may reset to default if it unexpectedly quits twice in row

This article has been archived and is no longer updated by Apple.

In Mac OS X 10.4 Tiger, if Mail (or any other application, but Mail is our focus here) unexpectedly quits twice in a row, you will be given the opportunity to open the application with the default ("safe") settings by clicking a Try Again button in a dialog that appears when you open Mail a third time.

In the unlikely event that Mail unexpectedly quits twice in a row, clicking the Try Again button should successfully open Mail. You will then be guided through setting up your Mail account (or accounts) again. Your previous Mail messages will appear after you complete the account set-up (assuming that you've set up the same account that you were using before).

Important: If you enter different account information than before, Mail will not show messages for the account you were using prior to the two unexpected quits. But it doesn't delete those missing messages either—they'll be available once you set up that account again in Mail preferences.

For example, let's say that you use a POP server-based Mail account named MyMail for the address myfakeaddress@fakeplace.com, and have many messages in your Inbox. If Mail unexpectedly quits twice in a row and you click Try Again when opening Mail a third time, Mail will open and ask you to fill in your account information. If you fill in the same "MyMail" account information, you'll have access to your "MyMail" messages. If you fill in different information, such as an IMAP server or address of myfunaddress@funfakeplace.com, you won't see your original "myfakeaddress@fakeplace.com" messages until you set up the account the same way it was before.

Alternatively, if messages are missing after using the Try Again button, you could import the mailboxes from ~/Library/Mail.

iDVD 5: Project capacity is reported in size and time

This article has been archived and is no longer updated by Apple.

In iDVD 5, the DVD Capacity meter (in the Customize drawer, click the Status tab) reports the project size differently than in earlier versions of iDVD. When you add media assets to an iDVD 5 project (such as video, slideshows, and audio), the DVD Capacity meter updates to show the size of your project; you can have the meter indicate the current running time (the total time for all media and transitions) or the total disc space used. To switch the display between minutes and gigabytes (GB), click the text to the right of the DVD Capacity meter.

In earlier versions of iDVD, the meter did not necessarily indicate the actual running time for some elements, such as slideshows. In iDVD 5, this meter reports the actual running time of slideshows—not their video capacity equivalent. To determine how much space is available on your DVD after adding assets to the project, view the gigabyte display—not the time display. For more information on the iDVD Status pane, click here.

iSync: Do not disconnect phone when syncing it

This article has been archived and is no longer updated by Apple.

If your phone gets disconnected in the middle of a sync, iSync may stop recognizing the device afterwards. For example, iSync may report that it cannot find the phone when you go to sync a second time. If you look for the phone in the Add Device window in iSync, the phone won't be listed.

To avoid this issue, make sure that your phone's battery has a sufficient charge before initiating a sync, or consider connecting the phone to its charger during the sync. Do not disconnect the phone from the computer during a sync if you are using USB. Do not take the phone out of range during a sync if you are using Bluetooth.

If your phone is no longer recognized by iSync, you can resolve the issue by removing and then re-adding the phone following these steps:

1. In iSync, select the phone icon in the iSync window.
2. From the **Devices** menu, choose **Remove Device**.
3. In the resulting confirmation dialog that asks if you're sure you want to remove the device, click OK.
4. From the **Devices** menu, choose **Add Device**.
5. In the Add Device window, double-click your phone's icon to re-add the phone.

Once your phone is recognized by iSync, you will need to set up your device settings in iSync again. Take special care in selecting the option under **For First Sync**. If all your iCal calendar and Address Book data is already on the computer, select the option to "Erase data on device then sync." Otherwise, select the option to "Merge data on computer and device."

iDVD 5: Unable to select a transition for the forward button

This article has been archived and is no longer updated by Apple.

When you create an iDVD project that contains a movie with chapter markers, you may come across an issue where you can't select a transition to use for the "forward" button in a scene selection menu. This can happen if you're trying to do this directly in the project window. However, you will be able to add the transition if you switch the project to map view. Here's a bit more about what's going on here.

When you add a movie with chapter markers to a menu, iDVD automatically creates two buttons:

- A "play movie" button, which bears the title of the movie
- A scene selection button that links to a scene menu

If you double-click the scene selection button to open the scene menu, iDVD displays buttons named after each chapter in your movie. The number of buttons the menu displays depends on its theme (a theme can display up to 12 buttons per menu). Each scene menu contains a "back" button to go to the previous menu.

If you have a lot of chapters, the scene menu may only display the first group along with a "forward" button to navigate to another scene menu. If you want to add a button transition to this forward button, you will not be able to do this directly in the project window. To add a transition, switch to map view. For more information on scene selection menus, click here.

This document will be updated as more information becomes available.

Mac OS X 10.3: Mail - Can‘t reply to a message or forward it

This article has been archived and is no longer updated by Apple.

In Mail, you may receive a message that you can't reply to or forward. Nothing happens when you click the Reply or Forward button, but if you quit Mail and open it again, you will see empty "Re:" or "Fwd:" message windows, addressed to your intended recipient, for each attempt you made. This can happen if you're using Mail in Mac OS X 10.3 through 10.3.8.

To resolve this issue, download and install Mac OS X 10.3.9. As for those blank messages that might appear when Mail opens, just close their windows to get rid of them.

Published Date: Oct 10, 2016

Mac OS X 10.3: Disk Utility reports inaccurate "Volume needs to be repaired" message when checking Mac OS X 10.4 volume

This article has been archived and is no longer updated by Apple.

If you want to check a Mac OS X 10.4 Tiger volume with Disk Utility First Aid in Mac OS X 10.3, make sure that you use Mac OS X 10.3.9. Earlier Disk Utility versions will report false issues with the Mac OS X 10.4 volume, such as the following:

```
** /dev/rdisk0s7 (NO WRITE)
** Checking HFS Plus volume.
** Checking Extents Overflow file.
** Checking Catalog file.
** Checking multi-linked files.
** Checking Catalog hierarchy.
** Checking Extended Attributes file.
Invalid leaf record count (It should be 2 instead of 21)
** Checking volume bitmap.
** Checking volume information.
** The volume [Mac OS X Tiger] needs to be repaired.
```

For an accurate Disk Utility report, only check Mac OS X 10.4 volumes while started from a Mac OS X 10.4 volume or Install disc, or while started from Mac OS X 10.3.9. If you're using an earlier version of Mac OS X 10.3, download and install Mac OS X 10.3.9.

Mac OS X 10.4: Transferring a printer list

This article has been archived and is no longer updated by Apple.

You can transfer a list of printers from any computer that has Mac OS X 10.2 or later installed to a computer with Mac OS X 10.4 Tiger installed. With Tiger, you can also transfer a printer list from one partition to another on the same computer using Setup Assistant or Migration Assistant.

When starting Mac OS X 10.4 for the first time, the Setup Assistant appears, enabling you to transfer information from another computer or from another partition on the same computer. If you select "Network & other settings" and either "Applications folder" or "Files and folders on (volume name)" (or both), your list of printers will also be transferred.

If you've already completed the Setup Assistant but didn't transfer the printer list, you can use the Migration Assistant to transfer the list:

1. Open Migration Assistant in the Utilities folder (from the Finder's **Go** menu, choose **Utilities**).
2. Select either "Migrate Applications" or "Migrate Files and Folders" (or both) in the Migration Assistant window "Step 2 of 4: Pick Applications and Files".
3. Select "Network Settings" in the Migration Assistant window "Step 4 of 4: Machine Settings".

It's possible some raster (ink-jet) printers might not transfer, but if this happens, you can easily add them using the Print & Fax preferences in System Preferences. **Tip:** USB and FireWire printers are added to the printer list automatically if you have a driver installed for the printer and it's connected to your computer.

My transferred printer doesn't work

In the unlikely event that one or more printers that were transferred from another system do not work as expected on your Tiger computer, use the Print & Fax preferences in System Preferences to remove the printer, then add it again.

Motion, Mac OS X 10.4: Compound Blur may make a clip transparent

This article has been archived and is no longer updated by Apple.

If you're using Motion 1.0.1 with Mac OS X 10.4 Tiger and apply a Compound Blur without a blur map to a clip, the effect can make the clip transparent.

To prevent this issue, add an image or movie to the Blur Map well in Motion, in either the Inspector or the Dashboard.

The Compound Blur filter blurs an object using a specified channel of a blur map image. You can use a shape, still image, or movie file as a blur map image, and select any—or all—of its red, green, blue, alpha, or luminance channels to dictate the overall shape of the blur.

Logic Pro/Express 7.1: Adding loops to the Loop Browser

This article has been archived and is no longer updated by Apple.

Logic Pro and Logic Express come with a large number of Apple Loops for you to use in your music compositions, but you can also turn any audio region—up to one minute in length—into an Apple Loop, or add loops to the Loop Browser from the Finder.

To turn a region in the Arrange window into an Apple Loop, simply highlight the region and choose **Region > Add to Apple Loops Library**. In the resulting dialog, you can assign search tags to the loop for better sorting. The loop file will be stored at `~/Library/Audio/Apple Loops/User Loops/SingleFiles`.

To add loops to the Loop Browser from the Finder, simply drag an individual loop, or a folder containing multiple loops, onto the browser window. The loops are added to the Apple Loops library and indexed. If you use this method to drag a single loop to the Loop Browser, the loop will be copied to `~/Library/Audio/Apple Loops/User Loops/SingleFiles`.

If you drag a folder of loops that are located on the same drive and partition as the Loop Browser, the loops will be left at their current location and an alias of the folder will be created in `~/Library/Audio/Apple Loops/User Loops`. If the loops are located on a different drive or partition, you'll be asked whether you want to copy them to the loop library or index them in their current location (loops added from optical media will always be copied).

If you choose to copy them, the folder containing the loops will be copied to `~/Library/Audio/Apple Loops/User Loops/`. If you choose to index them at their current location, then an alias to the folder will be created in `~/Library/Audio/Apple Loops/User Loops/`.

About FCC Certification for Apple Products

This document describes the certifications of Apple products by the United States Federal Communications Commission (FCC).
This article has been archived and is no longer updated by Apple.

About Apple's FCC testing and self-declaration

Apple Computer's EMC test facilities have been accredited through the United States National Institute of Standards NVLAP program since 1996-08. This accreditation allows Apple Computer to test and self declare products meeting the requirements as complaint for the U.S. market. This self-declaration process only applies to unintentional radiating devices, not devices that intentionally transmit signals, such as Apple's wireless products.

Apple products that display the FCC logo are marketed through the self declaration process. These products do not have, and are not required to have, an FCC ID number. Instead of an FCC ID number, an FCC DOC logo will appear with the statement: "Tested To Comply With FCC Standards For Home Or Office Use." An FCC ID number is present on the wireless part of Apple's product, as required by the FCC.

You may be required to complete an FCC 740 form for products entering the United States through customs. For products displaying the FCC logo, box 2 should be checked on the FCC 740 form. In the field titled "FCC ID" on the form, write in "DOC".

A radio frequency (RF) device is defined as a product that emits RF energy either intentionally in the case of a transmitter, or unintentionally as in the case of a computer, or computer peripheral products. An FCC 740 Form must be provided for each type of non-U.S.-manufactured RF device in your shipment. Commodity examples typically regulated by the FCC are cordless telephones, microwave ovens, radio/tape recorder combinations, cassette cartridge type, video games used with TV, radio transmitters/receivers, and color/monochrome TV receivers, ADP display units/printers, and electronic musical instruments.

Logic Pro/Express 7.1: User-created loop doesn‘t sound like the original region

This article has been archived and is no longer updated by Apple.

If you create a loop from a region in an Audio Instrument track that uses sends to bus effects, and then drag the saved loop to another Audio Instrument track, the new loop will sound different from the original source region. This happens because the effects sends in the original track are not saved with the loop.

Logic Pro and Logic Express do not automatically assign effects to busses because doing so would potentially interfere with bus configurations that you've already set up in your song. However, effects that are inserted directly on the Audio Instrument channel will be automatically recalled when the loop is dragged to the Arrange window from the Loop Browser.

You can do one of the following workarounds to ensure that loops you create from Audio Instrument track regions will sound the same as the original regions:

- Drag your Audio Instrument loop (whose original region used bus sends) to an Audio track instead of to an Audio Instrument track. When you create an Audio Instrument loop, the audio file that is rendered, including its bus processing. This will sound the same as the original.
- When creating a loop from an Audio Instrument track region, insert all effects needed to reproduce the desired sound directly on the instrument's channel strip. This will allow a faithful recreation of all sound elements when you subsequently add the loop to an Audio Instrument track.
- When using Audio Instrument Apple Loops, manually set up the sends and bus effects needed to reproduce the sound of the original region.

Apple Wireless Mouse and Keyboard: Update firmware before upgrading to Mac OS X 10.4

This article has been archived and is no longer updated by Apple.

Before upgrading to Mac OS X 10.4 "Tiger," make sure that you update the firmware for your Apple Wireless Mouse and Keyboard first. The firmware updater for the Apple Wireless Mouse and Keyboard will not open in Mac OS X 10.4.

If you didn't do this before upgrading to Tiger, you can work around this issue by temporarily pairing the mouse and keyboard with a Bluetooth-enabled computer that's still using Mac OS X 10.3, and apply the firmware update from that computer.

About the update

The Wireless Keyboard and Mouse Firmware Updates improve Apple Wireless Keyboard and Mouse performance and reliability.

This document will be updated as more information becomes available.

Soundtrack Pro: Some elements are not included when sending a sequence or clip from Final Cut Pro 5

This article has been archived and is no longer updated by Apple.

When you send a sequence or clip from Final Cut Pro 5 to Soundtrack Pro, some elements, including speed clips, generators, slugs, transitions, and all markers other than scoring markers, are not included. This happens because Final Cut Pro does not render these elements out to the base layer movie which is sent to Soundtrack Pro's Multitrack Editor or Audio Waveform Editor.

Clips that were sent to the Waveform Editor will still have the elements when you open the clip in Final Cut Pro. Clips that were sent to the Multitrack Editor will not have these elements when opened in Final Cut Pro because the original will be replaced with the edited sequence.

Published Date: Feb 20, 2012

iDVD 5: Don‘t hide the application during a burn

This article has been archived and is no longer updated by Apple.

In Mac OS X 10.4 Tiger, it's now possible to hide iDVD while you're burning a DVD or saving a disc image using the **Hide iDVD** command under the **iDVD** menu. However, this can cause the application to unexpectedly quit.

To avoid this issue, do not hide iDVD while burning a DVD or saving a disc image. You can switch to another application in the Dock. This does not hide iDVD, but just sends it to the background.

Note: Encoding and burning DVDs uses a lot of processing power. Do not use other applications that place heavy demands on the system while you are encoding and burning a disc. For more information on burning DVDs, see "Burning your DVD."

If you update to Mac OS X 10.4.1, the option to hide iDVD has been disabled.

iPod: EQ setting change

This article has been archived and is no longer updated by Apple.

With the introduction of iPod Software 1.5, iPod Software 2.3, and iPod Software 3.0.2, the EQ setting is no longer displayed in the Settings menu as shown here:

Instead, to see the current EQ setting, you will need to select EQ in the Settings menu (Settings > EQ). On the next screen the current EQ setting will be highlighted. This change makes the EQ setting identical to the iPod mini and iPod photo.

To change the EQ setting, scroll to the setting you want and select it.

iPod models that use iPod Software 1.5

- iPod (scroll wheel)
- iPod (touch wheel)

iPod models that use iPod Software 2.3

- iPod (dock connector)

iPod models that use iPod Software 3.0.2

- iPod (Click Wheel)
- iPod Special Edition U2

Mac OS X 10.3 Server: Instructions for updating LDAP Replicas to Mac OS X 10.3.9 Server

This article has been archived and is no longer updated by Apple.

If you have a Mac OS X 10.3 Open Directory Master and one or more Mac OS X 10.3 LDAP Replicas, and want to update to Mac OS X 10.3.9 Server, please update the servers in this order:

1. Update all LDAP Replicas to Mac OS X 10.3.9 Server.
2. Update the Open Directory Master to Mac OS X 10.3.9 Server.

If the servers are not updated in this order, the LDAP Replicas may get out of sync with the Open Directory Master. If this happens, reset the role of the servers from LDAP Replicas to Standalone servers using Server Admin, then convert them back to LDAP Replicas after you update the Open Directory Master to Mac OS X 10.3.9 Server.

Mac OS X: Mac may not sleep when using some Bluetooth mice

Certain third-party Bluetooth mice may "sleep" or disconnect if left idle, to conserve battery power. This may prevent your Mac from sleeping. If you try choosing Apple > Sleep, your Mac may sleep for just a moment, then wake soon after.

This article has been archived and is no longer updated by Apple.

1. Choose Apple > System Preferences.
2. Click Bluetooth.
3. Click Advanced... in Mac OS X v10.5 or v10.6 or click the Settings tab in Mac OS X v10.4.
4. Deselect the "Allow Bluetooth devices to wake this computer" checkbox.
5. Click OK.

Alternatively, if you allow the Mac to wake, it will likely go back to sleep after the idle interval specified in its Energy Saver preferences.

Xsan 1.0: Upgrading an Xsan beta is not supported

This article has been archived and is no longer updated by Apple.

If you participated in an Apple Xsan Seed program, you will need to uninstall Xsan Beta before installing Xsan 1.0. Apple does not support upgrading Xsan Beta to Xsan 1.0.

Uninstalling Xsan Beta will delete Xsan volume(s), so make sure that you back up all your data and test your backups to ensure that you won't lose data. For instructions on how to uninstall Xsan, please see this article. For further instructions on uninstalling Xsan, click here.

Once the Xsan Beta software has been uninstalled, install Xsan 1.0 from the Xsan installation disc. After the installation has completed, you will need to manually recreate all volumes and restore all data to the new volumes.

Mac OS X Server 10.3: Error -43 when renaming files or folders using WebDAV

This article has been archived and is no longer updated by Apple.

On Mac OS X Server 10.3 to 10.3.9, WebDAV allows you to create, copy, and delete files on WebDAV volumes, but not rename them. If you try to rename a file or folder on a WebDAV volume that is on the default "wild-card" virtual host, you will get an Error -43 message. This issue does not affect volumes on named virtual hosts.

As a client-centric workaround, you can copy the file to a non-WebDAV volume, change the name of the copied file, copy it back to the WebDAV volume, and then delete the original file.

Qmaster startup item evokes security message in Mac OS X 10.4 Tiger

This article has been archived and is no longer updated by Apple.
Qmaster is Apple software that is included automatically when you install any of the following:

- DVD Studio Pro
- Final Cut Pro
- Motion
- Shake

If Qmaster is installed, you may see this message when Mac OS X 10.4 Tiger starts up:

Please note that this message does not indicate any issue with Qmaster or Mac OS X 10.4. If you see this message, just click the Fix button.

Note: After you click Fix and the computer finishes starting up, restart once more for the changes to take effect. After doing so, this message will not appear on subsequent startups.

If you see similar messages regarding items in StartupItems other than Qmaster, you should consider them independently from this specific message.

Apple Remote Desktop 2.0: Clients using DHCP may appear offline

This article has been archived and is no longer updated by Apple.

If a client's IP address changes, most often when DHCP renews its lease to the client or a range of clients, the Remote Desktop admin application may not correctly acquire the new IP address for some clients. Remote Desktop identifies client computers using the hardware address, but has to use the last known IP address when trying to access the client. If the IP address has changed, you need to use the network scanners to locate the new IP address of the client.

To quickly resolve this issue:

1. Open the Remote Desktop application.
2. Switch to Scanner mode.
3. Rescan the Local Network or Network Range where clients may reside.

If the client is found, its IP address will automatically be updated and your list of computers will again appear online.

Published Date: Feb 18, 2012

Mac OS X 10.4, Mail: Some mailbox files used by Mac OS X 10.3 are not deleted after importing

This article has been archived and is no longer updated by Apple.

If you used Mail with Mac OS X 10.3, then upgraded to Mac OS X 10.4 Tiger and imported your Mail mailboxes (messages and attachments), please note that Tiger will not delete some previous mailbox files. Tiger keeps them around just in case you want to back up your Mac OS X 10.3 mailboxes.

This won't pose any issues with your current mailboxes. However, if your previous mailboxes are pretty big—maybe you have lots of attachments or large messages—you might enjoy the disk space you'd get back by deleting them.

If you want Tiger to "devour" those mailboxes to free up some disk, follow these steps:

1. In the Finder, choose **Home** from the **Go** menu.
2. Open the Library folder.
3. Open the Mail folder.
4. Open the Mailboxes folder.
5. If you want to back up (archive) the mailboxes before deleting them, copy them to a different location, such as a burnable disc.
6. Open, one at a time, the mailbox folders that end with ".mbox" or ".imapmbox". (If you're curious, these folders were actually package files in Mac OS X 10.3 Panther.)
7. Inside each ".mbox" or ".imapmbox" folder, you'll see some items. Do not delete every item you see. These are files you may safely delete if you want to free up some disk space:

    - mbox (which is a file, not a folder)
    - table_of_contents
    - mbox.SKindex
    - Info.plist (but not Info.plist that's in the Mailboxes folder)
    - mbox.SKindex.isValid
    - content_index
    - content_index-(your computer name)-Computer.local

    It's OK if you don't see all of those files in each folder.
8. Empty the Trash.

Important: Do not delete any folders, including ".mbox" folders, ".imapmbox" folders, or "Messages" folders." These are used by Mac OS X 10.4.

Tip: If you don't immediately see available disk space increase, you probably have FileVault home folder protection enabled—simply log out and back in to let FileVault recover disk space.

iPod photo: How to add music to your photo albums in iPhoto 5

This article has been archived and is no longer updated by Apple.

In iPhoto 5, you can associate a specific song or playlist in your music library with an iPhoto photo album. That music will then also be associated with the photo album on iPod photo once you sync it. Here's how to do this.

1. In iPhoto, select a photo album in the Source list.
2. Click the play button in the window's lower-left corner.

3. Click the Music tab and select the music or playlist that you want.

4. Click Save Settings.
5. Sync your iPod photo in iTunes.

Mac OS X 10.4 Tiger: Roaming AirPort clients may lose IP address

This article has been archived and is no longer updated by Apple.

If your Mac OS X 10.4 computer is connected to a network over AirPort and you roam from one wireless access point to another, your computer may lose its IP address without warning.

Update to Mac OS X 10.4.1 or later to resolve the issue.

If you are reading this article from another computer and need to force a 10.4 computer back online so that you can get the update, you have two workarounds available. The first is to put the computer to sleep and then wake it back up. The second is to force DHCP lease renewal by doing the following:

1. Open System Preferences.
2. Click the Network icon.
3. From the **Show** pop-up menu, choose **AirPort**.
4. Click the TCP/IP tab.
5. Click the Renew DHCP Lease button.

Note: On a roaming or WDS network, your computer may switch base stations without being relocated, due to variations in environmental factors.

GarageBand 2: New tempo not recognized after switching audio interface

This article has been archived and is no longer updated by Apple.

When you switch from using one audio interface to another in GarageBand 2, you may come across a situation where your song plays back at its original tempo instead of your current one. This can occur if the interface you switched to wasn't turned on when you made the switch or wasn't connected when you started GarageBand, which causes GarageBand to switch to built-in audio support.

When you turn on the new audio interface or connect it while GarageBand is opened, GarageBand will ask if you want to use the new interface. If you choose to use it, your current song will play at its original tempo, which may or may not be your current one.

To avoid this issue, always make sure that your audio interface is connected and turned on before opening GarageBand. If you do need to change the selected audio interface, quit GarageBand, make your change, and then reopen GarageBand.

About the security content of Mac OS X 10.3.8 Update

This article has been archived and is no longer updated by Apple.

This document describes the security content included with the Mac OS X 10.3.8 Update, which can be downloaded and installed using Software Update, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred, and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How To Use The Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Security content of Mac OS X 10.3.8 Update

- **Kernel**
  CVE-ID: CAN-2005-0985
  Impact: Local system users can cause a temporary system stall.
  Description: An issue with the handling of requests to the fan control unit (FCU) driver could allow unprivileged local users to hang a system.
  Credit to Marcel Bresink of Marcel Bresink Software-Systeme for reporting this issue.

iSync: Canceling Palm sync takes a few minutes

This article has been archived and is no longer updated by Apple.

When you cancel a sync that includes a Palm device, it may take up to 5 minutes to stop. You may see one of the following alert messages appear:

- iSync and/or HotSync appear to be unresponsive
- Transport Monitor - could not complete your request (-600)
- Cancelling HotSync. This could take a few minutes.

This behavior is normal. Please be patient, and do not force-quit the iSync or HotSync application.

About Security Update 2005-004

This article has been archived and is no longer updated by Apple.

This document describes Security Update 2005-004, which can be downloaded and installed using Software Update, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred, and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How To Use The Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Security Update 2005-004

- **iSync**
  Available for: iSync 1.5 on Mac OS X v10.2.8 and Mac OS X v10.3.x
  CVE-ID: CAN-2005-0193
  Impact: A buffer overflow in iSync could lead to local privilege escalation.
  Description: The iSync helper tool mRouter contains a buffer overflow vulnerability. This could result in the execution of arbitrary commands as root by local system users. Security Update 2005-004 fixes this issue by providing a patched version of mRouter. Credit to Braden Thomas for reporting this issue.

About the security content of the Mac OS X 10.3.9 Update

This article has been archived and is no longer updated by Apple.

This document describes the security content of the Mac OS X 10.3.9 Update, which can be downloaded and installed using Software Update, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred, and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How To Use The Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

To avoid a potential issue that may cause Java applications and Safari to unexpectedly quit, please review this article. Though the resolution to this issue utilizes a Security Update, it is not an actual security issue.

Security content of Mac OS X 10.3.9 Update

- **Kernel**
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  CVE ID: CAN-2005-0969
  Impact: A kernel input validation issue can lead to a local denial of service.
  Description: The kernel contains syscall emulation functionality that is not used in Mac OS X. Insufficient validation of an input parameter list could result in a heap overflow and a local denial of service through a kernel panic. The issue is addressed by removing the syscall emulation functionality. Credit to Dino Dai Zovi for reporting this issue.

- **Kernel**
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  CVE ID: CAN-2005-0970
  Impact: Permitting SUID/SGID scripts to be installed could lead to privilege escalation.
  Description: Mac OS X inherited the ability to run SUID/SGID scripts from FreeBSD. Apple does not distribute any SUID/SGID scripts, but the system would allow them to be installed or created. This update removes the ability of Mac OS X to run SUID/SGID scripts. Credit to Bruce Murphy of rattus.net and Justin Walker for reporting this issue.

- **Kernel**
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  CVE ID: CAN-2005-0971 CERT: VU#212190
  Impact: A kernel stack overflow in the semop() system call could lead to a local privilege escalation.
  Description: The incorrect handling of system call arguments could be used to obtain elevated privileges. This update includes a fix to check access to the kernel object.

- **Kernel**
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  CVE ID: CAN-2005-0972 CERT: VU#185702
  Impact: An integer overflow in the searchfs() system call could allow an unprivileged local user to execute arbitrary code with elevated privileges.
  Description: The searchfs() system call contains an integer overflow vulnerability that could allow an unprivileged local user to execute arbitrary code with elevated privileges. This update adds input validation on the parameters passed to searchfs() to correct the issue.

- **Kernel**
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  CVE ID: CAN-2005-0973
  Impact: Local system users can cause a system resource starvation.
  Description: A vulnerability in the handling of values passed to the setsockopt() call could allow unprivileged local users to exhaust available memory. Credit to Robert Stump (rds3792@cs.rit.com) for reporting this issue.

- **Kernel**
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  CVE ID: CAN-2005-0974 CERT: VU#713614
  Impact: Local system users can cause a local denial of service.
  Description: A vulnerability in the nfs_mount() call due to insufficient checks on input values could allow unprivileged local users to create a denial of service via a kernel panic.

- **Kernel**
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  CVE ID: CAN-2005-0975
  Impact: Local system users can cause a temporary interruption of system operation.
  Description: A vulnerability in the parsing of certain executable files could allow unprivileged local users to temporarily suspend system operations. Credit to Neil Archibald for reporting this issue.

- **Safari**
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  CVE ID: CAN-2005-0976
  Impact: Remote sites could cause html and javascript to run in the local domain.
  Description: This update closes a vulnerability that allowed remote websites to load javascript to execute in the local domain. Credit to David Remahl for reporting this issue.

Mac OS X Server 10.2 and later: How to change default file permissions for the FTP service

This article has been archived and is no longer updated by Apple.

When you upload a file over FTP, the resulting file includes the default UNIX permissions as if you created the file on your desktop. In a group work environment, this can prevent others from modifying the file. If you want to implement more useful permissions, edit the server's "ftpaccess" configuration file.

1. Open the file /Library/FTPServer/Configuration/ftpaccess in a text editor. (See "How to Locate and Edit Configuration Files" for more information.)
2. Type the following line at the end of the file:

   ```
   defumask <umask>
   ```

   Where `<umask>` is an actual umask value, such as 002 (see "About umask values," below).
3. Save the file.
4. Restart the FTP service.

About umask values

Generally speaking, a umask value is subtracted from the highest permission value possible on the host system. Permission values range from 000 to 777, which is an abbreviated way of notating owner/group/other access levels of rwxrwxrwx (find more information here). A 0 (zero) means no access, while other numbers are the sum of 1, 2, and 4, where 4=Read, 2=Write, and 1=Execute.

A permission that's commonly desirable is 775, in which the owner and group have full access and unknown users have read-execute access. Because the umask value is *subtracted* from the most permissive value (usually 777), a umask of 002 yields an effective permission of 775.

This explanation is somewhat simplified. If you are not comfortable with altering permissions, consult someone who is, check out some Internet resources, or find information at your local bookstore before proceeding.

Tip: For a full explanation of the defumask directive, type `man ftpaccess` in Terminal to view the manual.

iMac G5: Mounting an iSight camera

This article has been archived and is no longer updated by Apple.

It's easy to mount an iSight camera to an iMac G5. Just follow these simple steps:

1. Use the magnetic display mount that came with the iSight.
2. Push the end of the iSight FireWire cable into the mount as shown below.

3. Be sure the FireWire cable can reach one of the FireWire ports on the back cover of your iMac G5.
4. Connect the iSight to the top of the mount.
5. Place the mount on top of your iMac G5 display in the center. A magnet that's located here will hold the iSight magnetic mount in place.

Mac OS X 10.4: Unable to install iPhoto or iMovie from iLife ‘05 disc

This article has been archived and is no longer updated by Apple.

In Mac OS X 10.4, you will not be able to install iPhoto or iMovie directly from their respective "package" files on the iLife '05 disc. You may see the following:

- Volumes are dimmed during the installation process.
- Moving the mouse over the dimmed volumes displays the message, "A newer package is already installed," even though you haven't installed iPhoto or iMovie yet.

Instead of trying to install these applications from their individual packages, use the iLife Installer on the iLife '05 disc. You can then use the "Customize" option and select only the applications that you want to install.

This should not occur in iLife '06.

Mac OS X Server: Open Directory Master requires proper DNS for KDC to work

This article has been archived and is no longer updated by Apple.

When configuring Mac OS X Server 10.3 or later as an Open Directory Master, the Kerberos Domain Controller (KDC) won't start without proper DNS setup.

The server should have both forward and reverse DNS records. You can verify this by issuing the following command in the Terminal, at the server, before configuring it as an Open Directory Master.

```
# host <name/address>
```

In place of `<name/address>`, type the IP address or fully qualified domain name (FQDN) of the server. Whichever one you type, it should return the other. If it doesn't work on both directions, DNS isn't set up properly for your server.

If your DNS is running on Mac OS X Server, you can learn more about it in the DNS section of the Network Services guide found here. If your DNS is on another platform, consult the appropriate resources or the system administrator.

Mac OS X 10.4: Don‘t use Tech Tool Deluxe 3.0.3‘s Volume Structure repair

This article has been archived and is no longer updated by Apple.

Do not use the Volume Structure repair function of Tech Tool Deluxe 3.0.3 on Mac OS X 10.4 Tiger volumes. It is not compatible with the file system. If you need to repair a 10.4.x volume, use Disk Utility instead.

A "Failed (Error = -64)" message may appear, and other issues can occur, such as a kernel panic message appearing during start up.

Tech Tool Deluxe 3.0.4 has been released and is compatible with Mac OS X 10.4 Tiger volumes.

Important: If you received Tech Tool Deluxe 3.0.3 with an AppleCare Protection Plan, and are experiencing these symptoms after using Volume Structure repair, contact AppleCare for information about receiving version 3.0.4.

Soundtrack Pro: Audio sounds distorted when using Match EQ

This article has been archived and is no longer updated by Apple.

When you preview tracks in Soundtrack Pro using Match EQ in the Waveform Editor, the audio can sometimes sound distorted.

This issue occurs if you activate the Learn button (under Template) or the Learn button (under Current Material) before you load a template or audio file from which Match EQ can learn the audio spectrum.

Note: The Learn button (under Template) is red when enabled and the Learn button (under Current Material) is green when active. Both buttons are black when disabled.

The best way to avoid this is to always load a settings file or audio file from the Learn button (under Template) before attempting to preview (Control-click on the button for options). If you do get distorted audio from previewing prior to loading a template, disable the Learn button (under Template) button by clicking it once (it should turn from red to black) and the audio will play normally.

iSync 2.0: "Erase data on device" is default first sync option in Mac OS X 10.4, but not 10.4.1 or later

This article has been archived and is no longer updated by Apple.

With *Mac OS X 10.4.1 or later*, the first time you add a mobile phone to iSync version 2.0, the default first sync option is "Merge data on computer and device," which doesn't erase anything from your phone. You can download and install Mac OS X 10.4.1 Update or later from Apple Downloads.

With *Mac OS X 10.4*, the first time you add a mobile phone to iSync version 2.0, the default option for the first sync is "Erase data on device then sync." This option does just that—it erases syncable data from the phone, no matter what's on it. Change it to "Merge data on computer and device" if you wish.

If you don't want to lose the data on your phone, use "Merge data on computer and device." This setting won't erase anything from your phone.

Important Bluetooth note: When you add a Bluetooth phone using the Bluetooth Setup Assistant, iSync opens but will not show you the default first sync setting ("Erase data on device then sync") unless you click the phone's icon in the iSync window. Be sure to double-check your iSync settings before pressing the Sync Device button to avoid data loss.

iPod photo: Unexpected behavior may require software update

This article has been archived and is no longer updated by Apple.

Unexpected behavior can occur on iPod photo if you are using version 1.0 of the software.

You may experience any of the following:

- Your iPod resets constantly.
- Your iPod won't play shuffled music, but non-shuffled music plays fine.
- Your iPod resets when playing shuffled music, but doesn't do so when playing non-shuffled music.
- Album art does not appear on your iPod screen for songs that have album art.
- No photos or albums show up in the Photos section on your iPod screen. However, when you look in **Settings > About** on iPod photo, the number next to "Photos" indicates that there are photo files on the iPod.
- No songs or playlists show up in the Artists, Songs, Albums, or Playlists sections on your iPod screen. However, when you look in **Settings > About** on iPod photo, the number next to "Songs" indicates that there are song files on the iPod.
- Pictures do not display on a connected television when playing a slideshow out to your TV.

If you experience any of the above symptoms, download and install the latest iPod Updater and then update your iPod.

Mac OS X 10.4: About Dashboard Weather widget settings

This article has been archived and is no longer updated by Apple.

The Dashboard Weather widget might provide information about a city other than the one set in Date & Time preferences. But you can easily adjust the widget's settings if needed.

For example, the Weather widget might display temperature and weather information about a different city of the same name as yours (you might have Austin, TX selected in the Date & Time preferences, but the Weather widget displays weather for Austin, PA; or Sydney, FL instead of Sydney, Australia).

If this happens, change the city in the Weather widget. Just click the "i" button and enter a new city and state, or zip code, in the field. You can also change the temperature display from Fahrenheit (F) to Celsius (C), or vice-versa if you want.

Keynote 2.0.1 unable to print to some network printers

This article has been archived and is no longer updated by Apple.

If you have presentations in Keynote 2 that contain some built-in themes that use transparency (such as Graph Paper), the presentation may not print to some network printers, such as the HP Color Laser Jet 4500. You won't see an error message onscreen, but your print job may suddenly disappear when you try to print.

This can happen with Keynote 2.0.1, HP Color Laser Jet 4500 (there may be other affected network printers), and Mac OS 10.3.6 through 10.3.9. This does not occur on Mac OS 10.4 Tiger.

To prevent this from happening, make sure that all objects in your presentation are set to 100-percent opacity.

Mac OS X 10.4: Troubleshooting registering computer for .Mac Sync

This article has been archived and is no longer updated by Apple.

When you select the "Synchronize with .Mac" checkbox in the .Mac pane in System Preferences and attempt to sync, you may receive an alert message that says:

> **.Mac Sync Error**
> This computer is no longer registered to sync with .Mac - perhaps it was unregistered from another computer. Please re-register this computer using the .Mac System Preferences and try again.

If this happens, you may also notice that when you click "Register This Computer," your computer won't get registered.

This can occur if your computer name or long Mac OS X user name contains an ampersand (&). To resolve this issue, either update to Mac OS X 10.4.1 or later, or change your computer name or long user name so that it doesn't contain an ampersand.

To update Mac OS X, either use the Software Update pane of System Preferences, or find the latest update on the Apple Support Downloads page.

If you choose to change your name, there are a couple of places to check to make sure there's no ampersand in the name:

1. Open System Preferences (if it isn't open already).
2. Click Sharing.
3. In the Computer Name field, change the text so that it no longer contains an ampersand.
4. Click Show All at the top of the window to display all preferences.
5. Click Accounts.
6. Make sure that none of the users of the computer have names containing ampersands. (For example, use "Jack and Jill" instead of "Jack & Jill".)
7. Click Show All at the top of the window to display all preferences.
8. Click .Mac to display its preference pane and register your computer for syncing.
9. Click the Sync tab, then click Sync Now to sync.

iSync‘s "Only synchronize contacts with phone numbers" option may remove email addresses from Motorola phones

This article has been archived and is no longer updated by Apple.

If your Motorola phone has "limited" contact support (see below), the "Only synchronize contacts with phone numbers" option in iSync could cause email addresses to be removed from your phone (but remain in Address Book), if you entered the addresses on the phone itself. This can happen if you've selected the "Synchronize email addresses" option, which is off by default.

This applies to all versions of iSync, including versions 1.5 and 2.0.

For example, if you enter a name with an email address on your phone and then sync with this option *off*, iSync will sync the name and email address on the phone with Mac OS X's Address Book. But if you turn this option *on* and then sync again, the contact's email address will be removed from your phone.

As a workaround, use Address Book to enter email addresses for your contacts instead of entering them on your phone.

What is limited contact support?

By "limited," we're referring to phones that can only store names, text email addresses, and phone and fax numbers for each contact. If your phone can also store other kinds of information for each contact, such as notes and URLs, it's probably not "limited," and this issue shouldn't affect you. For example, Symbian OS-based phones are not "limited."

iSync 2.0 includes Palm Conduit

This article has been archived and is no longer updated by Apple.

If you have a Palm OS device, iSync version 2.0 (included with Mac OS X 10.4 Tiger) can install iSync Palm Conduit for you if you need it. You no longer have to download it from the web, as was required with earlier versions of iSync.

Tip: You will also need to install Palm HotSync software. iSync 2.0 will prompt you to install it if it doesn't find it.

Tip: Don't use previous Palm Conduit software with iSync version 2.0. Only use iSync Palm Conduit installed by iSync version 2.0.

To install the necessary software, simply enable Palm OS syncing in iSync 2.0:

1. Open iSync 2.0.
2. From the **Devices** menu, choose **Enable Palm OS Syncing**. The conduit will be installed if it needs to be.

There are other steps in the process of setting up a Palm OS-based device, such as opening HotSync Manager and checking conduit settings. Check out this document.

Note: To enable the Palm Conduit you must login as a user with administrator privileges.

For more information about Palm Device support in iSync, see the Help menu in iSync.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X 10.4: Use iTunes for iPod syncing

This article has been archived and is no longer updated by Apple.

In Mac OS X 10.4 or later, you can sync contacts and calendars to your iPod with iSync 2.0. But you may notice that you cannot add iPod to iSync once the latest version of iTunes is installed. That's because iTunes will take over these duties from iSync. Follow these steps to configure what contact and calendar information you want synced to your iPod:

1. Connect your iPod.
2. Open iTunes if it doesn't automatically open.
3. Select your iPod in the Source pane.
4. Click the Contacts tab.
5. To turn on contact syncing, select "Sync Address Book contacts."
6. To turn on calendar syncing, select "Sync iCal calendars" (you may need to scroll down to see this).
7. Click Apply and iTunes will sync the information to your iPod.

If you are using Mac OS 10.4 or later but haven't upgraded to at least iTunes 4.8, you can continue using iSync to sync contacts and calendars to your iPod. Please note that iSync will not automatically launch when you connect your iPod. Instead, your information will sync to iPod in the background whenever you connect it.

If you are using Mac OS 10.3.9 or earlier, you cannot use iTunes to sync contacts and calendars to iPod.

Notes

1. Once you start using iTunes to sync your contacts and calendars with your iPod, you won't be able to use iSync to synchronize with your iPod.
2. Calendars that have a colon ":" in the name may not sync to the iPod.

Bluetooth: Security Update 2005-005 makes changes to default sharing settings

This article has been archived and is no longer updated by Apple.

Security Update 2005-005 makes changes to the default settings for Bluetooth File Transfer, also known as Bluetooth FTP. If you customized the settings prior to the Security Update, your personal settings will be retained.

The original default setting was to enable browsing of the Shared folder. This allowed any other Bluetooth user to anonymously browse your Shared folder (/Users/Shared).

After installing the Security Update, you will see two changes to the default settings.

- Browsing is off by default.
- The folder that's being shared has been changed to the Public folder that's in your Home folder.

If you were using the default settings and want to keep sharing contents in the Shared folder (/Users/Shared), click the Choose Folder button to reselect it.

Bluetooth follows the settings for the user who's currently logged in to the computer, so other user accounts may have different Bluetooth settings if any user personalized his or her settings prior to the Security Update. Example: If two users of a computer had never modified their old default settings but a third user had modified hers, then the first two users would get the new default settings when they log in, but the third user would still have the personalized settings when she logs in.

Mac OS X 10.4: When to use PPPoE over AirPort

This article has been archived and is no longer updated by Apple.

Mac OS X 10.4 Tiger allows you to use Point-to-Point Protocol over Ethernet (PPPoE) over AirPort. This feature is intended for very specific situations. It should only be used when the base station is in wireless bridge mode *and* when one of these conditions applies:

- Your Internet Service Provider (ISP) has issued hardware designed for this feature.
- When required by certain wireless hot spots, primarily outside the United States.
- Your local network administrator says it's required.

Unless it's required, you probably don't need to be using this feature.

Mac OS X Server: LDAP temporarily unavailable after updating to 10.3.9

This article has been archived and is no longer updated by Apple.

After updating to Mac OS X Server 10.3.9, network users won't be able to authenticate, home directories won't mount, and you won't be able to complete any operation that requires access to LDAP data.

This happens because Mac OS X Server 10.3.9 includes a new schema for Open Directory that requires the database to be reindexed. This occurs on the first restart after the update, and it can take several minutes (the more users you have, the longer it will take).

Verifying the process

During the reindexing, the LDAP database is offline. To verify that indexing is in progress, open Activity Monitor and set it to show all processes. Look for a process named *slapconfig*. Another option is to use `ps -ax | grep slapconfig` in Terminal.

slapconfig must finish

The slapconfig process needs to finish to completely index the database. In the event that indexing has been interrupted (crashed), you should manually restart the indexing process by executing the Terminal commands listed below. Please note that this process also takes the LDAP server offline and can take several minutes, depending on the size of the LDAP database.

Note: You should only do this if the crash is evidenced by presence of the log file, /Library/Logs/CrashReporter/slapindex.crash.log.

1. `sudo SystemStarter stop LDAP`
2. `sudo slapindex`
3. `sudo SystemStarter start LDAP`

Checking your search path

After slapconfig has finished, verify the search path is set to include the /LDAPv3/127.0.0.1 node.

1. Launch the Directory Access utility.
2. If necessary, click the lock to authenticate.
3. Click the Authentication tab.

If the Search pop-up menu is not set to Custom Path and the "/LDAPv3/127.0.0.1" node is not in the Directory Domains list, do the following.

1. Select Custom Path from the Search pop-up menu.
2. Click Add
3. Select "/LDAPv3/127.0.0.1" in the list.
4. Click Add.
5. Click Apply.

Soundtrack projects with track panning effects may sound different when opened in Soundtrack Pro

This article has been archived and is no longer updated by Apple.

When you open a project from the original Soundtrack application in Soundtrack Pro, stereo tracks that include (or "make use of") panning effects may sound incorrect. They may sound like they are missing some or all signal from the channel opposite the pan direction when opened in Soundtrack Pro.

This happens because Soundtrack Pro handles stereo track panning differently than Soundtrack does. The pan slider in a Soundtrack Pro stereo track acts as a balance control (sometimes referred to as an *isolating* panner). With this type of pan, when you, say, move the slider to the left, the right channel is progressively removed from the signal.

Soundtrack features a *collapsing* panner in its stereo tracks. With this type of pan, when you, say, move the pan slider to the left, both channels of the stereo signal are progressively moved (collapsed) toward the left speaker.

Projects that you saved in Soundtrack that feature stereo track panning will not exhibit collapsed panning behavior when you open it in Soundtrack Pro. Instead, the panned signal may be faint or inaudible.

Apple Qadministrator clusters require managed services

This article has been archived and is no longer updated by Apple.

Although Apple Qadministrator currently allows you to create a cluster with unmanaged services, valid clusters require at least one managed service. To make them available in Apple Qmaster and Batch Monitor, you must create clusters with at least one managed service.

Apple Qmaster can be installed with DVD Studio Pro 4, Shake 4, and Final Cut Studio.

Published Date: Feb 18, 2012

Apple Qmaster: Cleaning up cluster storage

This article has been archived and is no longer updated by Apple.

If you are using Apple Qmaster with cluster storage and an error occurs, some partial files may be left on the designated cluster storage location. Check the cluster storage location to make sure that no partial media files are left there. If you find any, delete them and submit the job again.

This is more likely to occur if you're using Compressor and Apple Qmaster together.

(You can install Apple Qmaster from Final Cut Studio, DVD Studio Pro 4, or Shake 4.)

Remote Desktop 2.0, 3.0: Unable to access client when Common Criteria audit is enabled

This article has been archived and is no longer updated by Apple.

When you enable the auditing feature in Common Criteria Tools, the system may not be available in Remote Desktop. You can work around this by toggling the Remote Desktop service off and back on in the Sharing System preference pane. Or you can use the following command to restart Remote Desktop:

```
sudo /System/Library/CoreServices/RemoteManagement/ARDAgent.app/Contents/Resources/kickstart -restart -agent
```

Both of these workarounds will allow Remote Desktop to work until the client is restarted. After restarting, you must apply the workaround again.

The issue only occurs with certain combinations of software. It does not occur with Apple Remote Desktop 3.0 or later in combination with Mac OS X 10.4 or later and Common Criteria Tools for Mac OS X 10.4.

Mac OS X 10.3 and later, Mac OS X Server 10.3 and later: Unsaved changes will prevent automatic logout

This article has been archived and is no longer updated by Apple.

In Mac OS X 10.3 and later and Mac OS X Server 10.3 and later, you can have your computer automatically log out of your account if you've been inactive for a set amount of time. In the client version of Mac OS X 10.3 and later, you can turn on this feature in the Security pane in System Preferences. In Mac OS X Server 10.3 and later, you can set this option in Login Preferences (click the Auto Log-Out tab).

However, if you have a document open with unsaved changes, the application will cancel the logout process. This is expected behavior. Mac OS X 10.3 and 10.4 do this to prevent you from losing your unsaved data.

iPod: Inaccurate dates on photos synced from iPhoto

This article has been archived and is no longer updated by Apple.

When you sync photos from iPhoto to your iPod, the photo date displayed may be inaccurate; you may see one or both of the following:

- The date at the top of the iPod screen displays Dec 2000 for all photos.
- The full-resolution copies of the photos on the iPod are stored in this folder hierarchy: /*iPodname*/Photos/Full Resolution/2001/01/01 (where *iPodname* is the name of your iPod).

To resolve this issue:

1. Download and install the iPhoto Updater.
2. Open iPhoto.
3. Quit iPhoto.
4. Open iTunes.
5. Enable Disk Mode on the iPod.
6. Quit iTunes.
7. Drag these folders to the Trash:
   - /*iPodname*/Photos/
   - ~/Pictures/iPhoto Library/iPod Photo Cache/
     Note: The tilde "~" refers to your Home directory. For more information, see "Mac OS X: Using Your Home Directory."
8. Open iTunes; a message appears, indicating that the iPod is linked to another photo library or folder.
9. Click Yes to add all your photos back to the iPod.

You can then disable Disk Mode on the iPod if you want.

Mac OS X 10.4: Update iCal Help files after doing an Archive and Install

This article has been archived and is no longer updated by Apple.

If you install Mac OS X 10.4 Tiger over Mac OS X 10.3 using an Archive and Install installation, the Help files for iCal 2.0 (included with Tiger) will need to be updated. Otherwise, you'll see the Help content for iCal version 1.5 when you open Help from within iCal 2.0.

To update these files in Mac OS X 10.4, follow these steps:

1. Open the Applications folder.
2. Control-click the iCal application icon.
3. In the resulting shortcut menu, choose **Show Package Contents**; an "iCal.app" window opens with a Contents folder in it.
4. Open the Contents folder, then the Resources folder within it.
5. In the Resources window, look for folders whose names end with a ".lproj" extension. For easier finding, view the window as a list, then sort it by Kind (click the Kind header). Note that there are different ".lproj" folders for different languages, including English.lproj and German.lproj.
6. Open the .lproj folder for the language that you want to use.
7. Open the iCal Help folder in this folder.
8. Delete the "iCal Help.html" file (not a folder). **Do not** delete the similarly named " iCalHelp.html" (note that it has no space in the name) or any other files.
9. Repeat steps 6–8 for any other languages for which you want to update iCal Help.

This document will be updated as more information becomes available.

Xserve and Xserve G5: Fan too fast alert message

This article has been archived and is no longer updated by Apple.

You may occasionally receive alerts from your Xserve that the fans are spinning too fast. As long as the reported fan speed is no more than approximately 10-percent over warning message, and the increased speed happens only for four hours or less, your server is functioning normally.

If you receive a fan speed warning accompanied by an odd noise (such as squealing) or abnormal behavior, the Xserve may need to be serviced.

Final Cut Pro 5: Items to note when working with HDV

This article has been archived and is no longer updated by Apple.

When working with HDV (high-definition video) in Final Cut Pro 5, here are some special considerations that you should keep in mind.

Print to Video limitations using HDV formats

On computers that meet the minimum system requirements for HDV playback[1], the Print to Video command cannot be used if the Mirror to Desktop option is enabled. To turn off the Mirror to Desktop option:

1. Choose **Final Cut Pro > Audio/Video Settings**, then click the A/V Devices tab.
2. Deselect the Mirror to Desktop checkbox.
3. Click OK.

HDV Log and Capture Preview is disabled when a PCI graphics card is installed

If your computer has a PCI graphics card installed and you are logging or capturing HDV, Final Cut Pro does not preview video or audio in the Log and Capture window. You can still log and capture, but you'll need to use your HDV camcorder display to preview video.

Sony native MPEG-2 media must be exported for use in DVD Studio Pro

Sony HDV media records MPEG-2 media using an open GOP (Group of Pictures) structure, which means that B-frames in the MPEG stream may be reliant on frames in adjacent GOPs.

In some cases, using open GOP media in DVD Studio Pro can cause DVD decoder issues, particularly at the start and end frames of media files. To properly transfer open GOP MPEG-2 HDV media to DVD Studio Pro after capturing it in Final Cut Pro, export the media from Final Cut Pro using the Export QuickTime Movie option (**File** > **Export**). This command conforms the beginning of the MPEG-2 media to a closed GOP structure, which is compatible with DVD decoders.

HDV footage with timecode breaks may report a stream error during capture

In User Preferences, if you choose **Abort Capture** from the **On timecode break** pop-up menu, capturing is aborted when a timecode break is detected. Depending on the signal on tape, you may see one of two messages if the capture is aborted:

- A "stream error" message
- A "timecode break error" message

iMovie HD: Unable to eject audio CD after importing a track in iMovie

This article has been archived and is no longer updated by Apple.

If you add a track from an audio CD into your iMovie HD project, you may be unable to eject that CD while iMovie HD is running. In such cases, you will see a message like this one:

This can happen if you're using iMovie HD in Mac OS X 10.4 Tiger.

To eject your CD, save your project and quit iMovie HD. You will then be able to eject your CD normally. After the CD is ejected, open iMovie again and resume work on your project.

If you have a number of CD tracks that you wish to add to an iMovie project, you can avoid this issue by first importing the tracks into iTunes. Once they are in your iTunes Library, they will be available for use in iMovie HD without needing to have the CD in your computer.

About the WebObjects 5.2.4 Update

This article has been archived and is no longer updated by Apple.

This document contains an overview and download information for the WebObjects 5.2.4 Update. WebObjects 5.2.4 is primarily for developers of WebObjects applications on Mac OS X 10.4. WebObjects 5.2 users who use the Xcode 2.0 development tool suite or plan to deploy their WO 5.2 applications on Mac OS X Server 10.4, Windows, or Solaris should also install this update. WebObjects 5.2.4 is formally qualified and supported on the Java 1.4.2 platform.

The WebObjects Current Patch List contains information on all available patches and updates for all versions of WebObjects. Read this document if you're not sure which update you need on your system.

More details are listed below, but these are highlights of the update:

- Compatibility with Xcode 2.0 Developer tools on Mac OS X 10.4
- Compatibility between WebObjects 5.2 and Java 1.4.2 for Mac OS X 10.4
- Compatibility between WebObjects 5.2 and Mac OS X 10.4
- OpenBase SQL for Mac OS X 10.4
- Fixes for the Java Client Save/Delete/Update problems with WO 5.2.3

This update also introduces the WebObjects Server Admin plug-in for Mac OS X Server 10.4 which will migrate the WebObjects StartupItems mechanism for auto starting WebObjects services to launchd-based services. The documentation for deploying WebObjects applications can be found at here, and this documentation has been updated to describe the features of Mac OS X Server 10.4

WebObjects 5.2.4 Developer for Mac OS X 10.4

Important: There are two mutually exclusive updates for this platform. If you have WebObjects 5.2 Developer installed on Mac OS X 10.4, you need the WebObjects 5.2.4 Developer update. If you have WebObjects 5.2 Deployment installed on Mac OS X Server 10.4, you need the WebObjects 5.2.4 Deployment update. You do not need both on any system.

This update is available through the Software Update feature of Mac OS X. If you use this method, only the proper update for the software which you have installed on your system is visible and available for download. If you prefer to download and install the package manually, follow the instructions below.

System requirements

WebObjects 5.2.4 Developer requires:

- Mac OS X 10.4 or later
- Xcode 2.0 Developer tools
- Java 1.4.2

If you have not yet updated to the correct version of Mac OS X or Developer Tools, you must do so before installing WebObjects 5.2.4.

If you are creating a new Mac OS X WebObjects 5.2.4 development system, you should install the software in the following order:

1. Mac OS X 10.4
2. Xcode 2.0 Developer tools CD
3. WebObjects 5.2 Developer

   Important: After installing WebObjects Developer 5.2 and restarting your computer, you will get a warning message about fixing permissions. You may choose to fix, ignore, or disable the issue without adversely effecting the installation or compromising the security of your system. The WebObjects Developer 5.2.4 Installer will fix the permissions issues.

4. WebObjects 5.2.4 Developer

Manually installing WebObjects 5.2.4 Developer on Mac OS X 10.4

These instructions are for manually downloading and installing WebObjects 5.4 Developer. If you are installing using Software Update, see the previous section of this document.

System requirements

WebObjects 5.2.4 Developer requires:

- Mac OS X 10.4 or later

- JDK 1.4.2
- Xcode 2.0 Developer tools

If you have not yet updated to the correct version of Mac OS X, Java, or Developer Tools, you must do so before installing WebObjects 5.2.4.

1. Go to Apple Downloads and get the WebObjects 5.2.4 Developer update. The disk image should expand after downloading, leaving WO524Developer.pkg.
2. Open WO524Developer.pkg. The Authenticate panel opens. **Important:** Only an administrator can install the update.
3. Type the proper administrator name and password to authenticate.
4. Click OK to proceed. The Introduction panel appears.
5. Click Continue. The Software License Agreement appears.
6. Read the software license agreement, then click Continue.
7. Click Agree to agree to the license agreement, and continue the installation.
8. Select the volume containing Mac OS X and WebObjects 5.2 Developer.
9. Click Continue.
10. Make sure that there are no WebObjects or EOF applications running.
11. Click Install to proceed with installation. The Installer window displays information about the progress of the installation, which may take several minutes.
12. Restart your computer.

WebObjects 5.2.4 Deployment for Mac OS X Server 10.4

This update is available through the Software Update feature of Mac OS X. If you use this method, only the proper update for the software which you have installed on your system is visible and available for download.

System requirements

- Mac OS X Server 10.4 or later
- JDK 1.4.2

If you have not yet updated to the correct version of Mac OS X Server, you must do so before installing WebObjects 5.2.4.

If you are creating a new Mac OS X WebObjects 5.2.4 deployment system, all you need to do is install Mac OS X Server 10.4.

Configuration tasks:

To configure and start the WebObjects services:

1. Open the Server Admin application.
2. Select the WebObjects service.
3. Click the settings tab.
4. Configure the wotaskd and monitoring services.
5. Click the Start button.

Important: You do not need to manually edit the apache.conf file with the following line. We have already inserted it for you.

```
# Including WebObjects Configs Include /System/Library/WebObjects/Adaptors/Apache/apache.conf
```

Both Mac OS X 10.4 and Mac OS X Server 10.4 have a new, more reliable mechanism for keeping applications running. It is called "launchd". It supersedes the "SystemStarter" and "watchdog" processes of previous systems. See the man pages launchd(8) and launchctl(1) for more information. The Server Admin application uses the files at `/System/Library/LaunchDaemons/com.apple.wotaskd.plist` and `/System/Library/LaunchDaemons/com.apple.womonitor.plist` to configure the wotaksd and JavaMonitor applications; and launchd keeps the apps running, based on the information in these files. The scripts which formerly restarted the wotaskd or JavaMonitor process after a restart are no longer needed and can be deleted. The launchd process will launch these applications after restart for you and restart them if they crash for any reason. If you want to change the way the wotaksd and JavaMonitor applications are managed, that can be done with the facilities provided by launchd and its associated tools.

Installing WebObjects 5.2.4 on Windows 2000

System Requirements

WebObjects 5.2.4 Developer/Deployment requires:

- Java 1.4.2 (J2SE SDK)
- WebObjects 5.2

If you see panels indicating that certain files being replaced by the update are "locked" during installation, click Reboot to continue the installation.

The files will be replaced upon restarting.

This update cannot be uninstalled alone. Once you have upgraded to WebObjects 5.2.4 you cannot revert to a previous version of WebObjects 5.2. However, the entire WebObjects 5.2.4 installation can be uninstalled using the Add/Remove Programs control panel.

Follow these steps:

1. Download the WebObjects 5.2.4 Developer update for Windows.
2. Log in as a user with Administrator privileges.
3. Make sure that there are no WebObjects or EOF applications running.
4. Open WO524.exe to start the installation process. A screen appears with some information about this update.
5. After you have read the information screen, click Next to continue. The license agreement for this update appears.
6. To agree to the license and continue the installation, click Yes. The update will be installed on your system and you will be asked if you want to restart.
7. Select "Yes, I want to restart my computer now" to restart Windows.
8. The WinZip self-extractor automatically quits and removes its temporary files in about 20 seconds.

Installing WebObjects 5.2.4 on Solaris

System Requirements

WebObjects 5.2.4 Deployment requires:

- Java 1.4.2 (J2SE SDK)
- WebObjects 5.2.

If you have not yet updated to these versions, you must do so before installing WebObjects 5.2.4.

Follow these steps:

1. Download the WebObjects 5.2.4 Developer update for Solaris.
2. Download the update installation script patcher.sh.
3. After you have downloaded the files, the patcher.sh script needs its executable bit set. At the command prompt enter:

   ```
   chmod 511 patcher.sh
   ```

4. Log in as root.
5. Ensure that there are no WebObjects or EOF applications running, including Monitor.
6. If a web server is running on the computer on which you are installing the update, stop it.
7. Stop WebObjects services (wotaskd and woservice) using the WOServices script. At the command prompt enter:

   ```
   cd $NEXT_ROOT/Library/WebObjects/Executables ./WOServices stop
   ```

   These services will restart when you restart the computer after installing the update.

8. To Install the update, cd to the directory containing the update and the patcher.sh installation script. Then at the command prompt enter:

   ```
   patcher.sh -install WO524Solaris.tar.gzip
   ```

   For more information on using patcher.sh, at the command prompt enter:

   ```
   patcher.sh -help
   ```

9. Copy the updated WODocument root to your web server's document root.

   ```
   cp -r $NEXT_ROOT/Library/WebObjects/WODocumentRoot/WebObjects <webserver doc root>/WebObjects
   ```

10. Restart your computer.

Issues resolved in WebObjects 5.2.4

3397711: TITLE: EOEditingContext.refreshObject() breaks object observing mechanism.

ISSUE: EOEditingContext.refreshObject() breaks object observing mechanism. The root of the problem was that the refreshObject() called refaultObject(), which in turn cleared the object out of the updatedObjects list.

RESOLUTION: Refaulting objects with unsaved changes is now correctly handled. Changes would not be thrown away.

3485344: TITLE: WebObjects Builder consumed 100% CPU cycles whenever the src attribute of an IMG tag were set to an absolute URL.

ISSUE: Whenever a WebObjects Builder encountered an IMG tag whose src attribute was bound to an absolute URL, WebObjects Builder tried to fetch and display the content. However, the fetch sometimes led to an infinite loop and the time out mechanism for the fetch was broken.

RESOLUTION: This issue has been resolved.

3505762: TITLE: Documentation for NSLog Debug Groups Incorrect

ISSUE: Documentation for NSLog Debug Groups was Incorrect. The values are not listed in both numeric and alphabetic order.

RESOLUTION: This issue has been resolved.

3516904: TITLE: The performance on WebObjects Builder degraded significiantly when it encountered certain CSS contents, complex WebObjects Component or components with malformed html contents.

ISSUE: Certain CSS contents, complex WebObjects Components or components with malformed html contents could bring WebObjects Builder into a panic state, which led to a spinning wheel and a major performance hit.

RESOLUTION: This issue has been resolved.

3557641: TITLE: WebObjects Builder crashed upon opening certain WebObjects Components created with older version of WebObjects Builder.

ISSUE: Certain artifacts in a WebObjects Component created by older version of WebObjects Builder could make the latest version of WebObjects Builder crash.

RESOLUTION: This issue has been resolved.

3566580: TITLE: WOExceptionParser throws an exception.

ISSUE: Under certain circumstances, WOExceptionParser might throw an StringIndexOutOfBoundsException.

RESOLUTION: This issue has been resolved.

3596000: TITLE: Illegal state exception was thrown to suggest illegal lock usage.

ISSUE:In some uncommon cases an illegal state exception was thrown to suggest illegal lock usage. The root of the problem was that WOSession causes locking issues while disposing the EOEditingContext and putting the WOComponent to sleep.

RESOLUTION: This issue has been resolved.

3616063: TITLE: JavaClient does not handle save/delete consistently in some cases.

ISSUE: Adding a new record, saving, deleting, and then saving it again sometimes made Java Client applications throw an exception: "Save Failed: Server Exception: Attempt to insert null into an com.webobjects.foundation.NSMutableArray."

RESOLUTION: This issue has been resolved.

3641431: TITLE: Incorrect HTML generated for JSImageFlyover

ISSUE: The HTML generated for JSImageFlyover was Incorrect.

RESOLUTION: This issue has been resolved.

3642302: TITLE: Boolean was not handled correctly in Direct to Web.

ISSUE: Boolean was not handled correctly in Direct to Web.

RESOLUTION: This issue has been resolved.

3720010: TITLE: Accessing an image via SSL within a WOComponent causes WebObjects Builder to crash.

ISSUE: Accessing an image via SSL within a WOComponent causes WebObjects Builder to crash. Content fetching via http/https was broken in WebObjects Builder.

RESOLUTION: This issue has been resolved.

3735980: TITLE: Restricting qualifiers are not correctly migrated across relationships during prefetching

ISSUE: Restricting qualifiers are not correctly migrated across relationships during prefetching

RESOLUTION: This issue has been resolved.

3738943: TITLE: Removing observers from notification center prior to adding any observers throws an exception.

ISSUE: Removing observers from notification center prior to adding any observers throws an null pointer exception.

RESOLUTION: This issue has been resolved.

3739954: TITLE: WebObjects Builder could not handle the tag with absolute URL.

ISSUE: WebObjects Builder could not handle the tag with absolute URL.

RESOLUTION: This issue has been resolved.

3748926: TITLE: Certain debug information was logged to NSLog.err instead of NSLog.debug.

ISSUE: Information such as the URL for connecting to the WebObjects Application via WebServer went to NSLog.err instead of NSLog.debug.

RESOLUTION: This issue has been resolved.

3753879: TITLE: OpenBase distribution should be updated

ISSUE: OpenBase needs to be updated to a more current version that is compatible with Tiger.

RESOLUTION: OpenBase SQL 8 for Tiger is now bundled with WebObjects 5.2.4 Developer release.

3761296: TITLE: EOModeler loses track of Subversion hidden folder in eomodeld folder

ISSUE: EOModeler loses track of Subversion hidden folder in eomodeld folder

RESOLUTION: This issue has been resolved.

3767346: TITLE: WOCompletionBar generated invalid HTML attributes.

ISSUE: WOCompletionBar generated invalid HTML attributes.

RESOLUTION: This issue has been resolved.

3809485: TITLE: Missing documentation for the deprecated setValueClassName method in EOAttribute.

ISSUE: The method setValueclassName() defined in the class EOAttribute was deprecated. However, there was no documentation suggesting any replacement methods.

RESOLUTION: This issue has been resolved.

3845748: TITLE: Dragging items from a table and dropping them out of a table crashed WOB.

ISSUE: Dragging and dropping items into/out of a table has been causing WebObjects Builder to crash. The workaround is to use copying and pasting with keyboard instead.

RESOLUTION: Drag and Drop support has been turned off by default. To enable Drag and Drop support, launch WebObjects Builder with the argument "-WBDragNDrop."

3935864: TITLE: Creating a new instance of WebObjects Application causes JavaMonitor to throw an exception.

ISSUE: Under certain circumstances, creating a new instance of WebObjects Application could make JavaMonitor throw a null pointer exception.

RESOLUTION: This issue has been resolved.

Troubleshooting

- **My application is throwing the exception "com.webobjects.foundation.NSForwardException for java.lang.NoClassDefFoundError: javax/servlet/ServletContext".**

  For some reason, the necessary packages are not in your classpath. Debug your classpath to make sure the javax.servlet.* classes are there. If the classes are not found, the resolution is to download the servlet.jar and put it into /Library/Java/Extensions or in your classpath. The servlet.jar can be found with many open source distributions (e.g tomcat).

- **How do I convert my legacy WebObjects application to build as a true war bundle?**
  1. In Xcode, configure your build settings to the following:

```
SERVLET_SINGLE_DIR_DEPLOY = NO
SERVLET_STUB_WAR = NO
SERVLET_TRUE_WAR = YES
SERVLET_DEPLOY_LICENSE = <your deployment license>
SERVLET_WEBAPPS_DIR = /Library/JBoss/3.2/deploy
```

  2. Add the JavaWOJSPServlet.framework to your project.
  3. You should also verify that all of your custom frameworks are being built as jar files (BUNDLE_AS_JAR = YES) and are installed or linked into /Library/WebObjects/lib.

- **I have problems building a newly created Java Client Application (Three Tier) project. The client app crashes and I get a error in the console similar to:**

  ```
  apple.awt.EventQueueExceptionHandler Caught Throwable : java.lang.IllegalArgumentException: Controller class not found: javaclicent1.client.javaclicent1InterfaceController java.lang.IllegalArgumentException: Controller class not found: javaclicent1.client.javaclicent1InterfaceController
  ```

  The WebServer target for the Java Client template in Xcode 2.0 is not configured correctly and the [projectname]InterfaceController.java class is in the the 'Copy Bundle' phase instead of the 'Compile Sources' phase. To workaround this problem, move the [projectname]InterfaceController.java source to the 'Compile Sources' phase of the WebServer target.

- **The WebObjects Apache adaptor is not configured on WebObjects Developer 5.2.4 after a Tiger upgrade install**

  Check the file `/etc/httpd/http.conf` and verify if the line below exists:

  ```
  Include /System/Library/WebObjects/Adaptors/Apache/apache.conf
  ```

  If not, add it to the file, save and restart your web server either in System Preferences or by typing "sudo apachectl restart" in Terminal.

Logic Pro/Express, Soundtrack, Soundtrack Pro: Plug-in window text not localized

This article has been archived and is no longer updated by Apple.

The text displayed in Logic Pro, Logic Express, Soundtrack, and Soundtrack Pro plug-in windows is always in English, no matter what language you selected.

For technical reasons, the text found in the various interface elements of plug-ins is always in English. Many of the terms derive from universal audio vocabulary that would not make sense in other languages.

Soundtrack Pro: How to paste to only one channel of a stereo audio recording

This article has been archived and is no longer updated by Apple.

If you want to paste audio into only one channel of a stereo audio recording, it may not be immediately obvious how to do this in the Soundtrack Pro Waveform Editor.

For example, if you copy a section of audio from one channel, select a section with both channels selected, and then choose **Edit > Paste**, the audio will be placed in both channels. If you make a selection in only one channel and attempt to paste, the **Paste** command will be dimmed in the **Edit** menu.

This happens because you can't edit one channel of a stereo audio file in such a way that the two channels would become different lengths. However, there is a way to paste a single channel of audio into only one channel of an audio file. Here's how to do it:

1. Copy the audio you want to the clipboard.
2. Set an insertion point in the channel that you wish to paste to by clicking on the desired point in the timeline—either near the waveform's upper edge for the left channel, or near the lower edge for the right channel. The cursor will turn into a small arrow with an L or R, respectively, to indicate the selected channel.
3. Choose **Edit > Paste Special > Paste Mix**. The following dialog appears:

4. In the dialog, set "Original Material Level" to 0 (zero) percent, set "Clipboard Level" to 100 percent, and click OK to paste.

The contents of the clipboard will replace the current material in the selected channel, thus preserving the length of the channel in relation to the other.

Mac OS X 10.3.9: Users with account limitations cannot log in

This article has been archived and is no longer updated by Apple.

After updating to Mac OS X 10.3.9, a user who has account limitations may be unable to log in to the computer. When they attempt to log in from the Login window, the progress bar may stop moving and the computer may stop responding ("freeze").

This document applies to Mac OS X 10.3.9.

What can you do? Try any of these workarounds:

- Try deselecting the "Change password" checkbox under Limitations in Accounts preferences may resolve the issue.
- The user may be able to log in using Fast User Switching (that is, log in as a different user, then switch to the limited user).
- When logged in as an administrator, change the managed user account to a standard user account (one without limits but no administrator privileges) in Accounts preferences.

This document will be updated as more information becomes available.

Mac OS X 10.4 Tiger: AirPort preferred network settings affect all locations

This article has been archived and is no longer updated by Apple.

When you make changes to your preferred networks in AirPort preferences on a computer with Tiger, please note that the settings will affect all of your Locations.

Before Tiger, you were limited to one AirPort TCP/IP configuration per Location, which forced some people to create additional Locations to meet the configuration requirements of different networks. Tiger lifts that limitation, so you can create extra port configurations in one Location, and Tiger will automatically use the appropriate one. This means you can now go from place to place without touching the Locations menu.

The only people affected by the new global nature of preferred networks are those who are in the presence of several wireless networks at the same time and were using the Locations menu to switch between them. The preferred method for achieving this effect is to simply switch networks in the AirPort menu.

If you don't have this menu in your menu bar, go to the AirPort section of Network preference and check the box for "Show AirPort status in menu bar."

iMovie HD: No sound after applying a title, effect, or transition to an MPEG-4 video clip

This article has been archived and is no longer updated by Apple.

If you use MPEG-4 video in an iMovie 5.0.2 HD project, you may notice that when you apply an effect, transition, or a title over a video clip, you don't hear any sound when you play back your edited clip. If you export the movie, the exported movie will also be affected. This occurs on computers with Mac OS X 10.4, or Mac OS X 10.3.9 with QuickTime 7.

To avoid this issue, extract the audio before applying the effect, title, or transition. Then reapply the sound after the video has been modified.

This document will be updated when additional information is available.

Mac OS X 10.4: If FileVault "secure erase" is interrupted, data loss may occur

This article has been archived and is no longer updated by Apple.

When you turn on FileVault protection for an account in Security preferences (in System Preferences), your entire home directory is converted into an encrypted disk image. With Mac OS X 10.4 Tiger, you can also securely erase data when FileVault protection is turned on by clicking the "Use secure erase" checkbox when the "You are now ready to turn on FileVault protection" dialog sheet appears.

If you select this option, *do not interrupt the secure erase process* (see below)—even if "Unmounting FileVault" appears for a long time.

Tip: It's a good idea to make a back up of important files, or even your entire home directory, before turning on FileVault.

The secure erase option means that after files are copied to the FileVault encrypted disk image, they are securely erased from your computer, like the Finder's Secure Empty Trash feature.

Important: If the secure erase process is interrupted:

- You may not be able to log in with the account that you were enabling FileVault protection for.
- All files within your Home, including things that were on your desktop, in your Documents, Pictures, Movies, and Music folders, your bookmarks, Mail messages, and your application settings, may be lost (even if you can log in with a different account afterwards).

Tip: When using this option on a portable Mac, it's a good idea to make sure the AC power adapter is connected.

The FileVault secure erase process

After you click "Turn On FileVault" with the "Use secure erase" option enabled, you will be logged out and the FileVault window will appear (it looks like the Login window). A status message tells you how long it will take to move files to your encrypted home directory.

After that, the secure erase process starts, but you won't see a status message that indicates how long it may take (you'll see an "Unmounting FileVault" message in the status area).

Important: The "Unmounting FileVault" message remains until the secure erase is finished. Don't interrupt it!

The secure erase is great for ensuring that files are securely deleted after they're moved to your encrypted disk image, but this can take a while to complete, just like using Secure Empty Trash in the Finder, which can take a long time when you're deleting lots of data. How long it takes depends on how much information is in your home directory and how fast your Mac is. Don't force-restart your computer or interrupt the process in any other way.

I interrupted the secure erase process

You probably can't log in. If you can log in as a different user, you probably can't find your files (or a FileVault-created disk image) in your original user account.

Do you have another administrator account already set up? If so, log in as that when starting up instead of with the account that was interrupted during the FileVault activation. Then, use Account preferences to delete the account which you can no longer log in as. Create the account again afterwards. Finally, log in as the new replacement account. If you have a back up of important files as mentioned above, restore your important data from it. Afterwards, you can enable FileVault for the account again.

If you have no other account set up, you'll need your Mac OS X 10.4 Tiger Install disc. Start up from the disc and perform an Archive and Install installation. Do not preserve user accounts and network settings. See this document for more information.

This document will be updated as more information becomes available.

Mac OS X 10.4, .Mac: Downloaded iCal events don‘t open in iCal

This article has been archived and is no longer updated by Apple.

With Mac OS X 10.4 Tiger, iCal events that you download using .Mac Webmail will have an HTML (.html) file extension instead of an iCal (.ics) one. Because of this, when you double-click the file, iCal won't open and instead, your default web browser will try to open the file (or whatever application you've assigned to open .html files).

If this happens, simply change the ".html" file extension on the affected file to ".ics." For example, if you download an iCal 1.5-sent invitation event named "mydates" using .Mac Webmail, the file will be saved as "mydates.html." To make this file open in iCal when you double-click it, change its name to "mydates.ics."

Note: Mac OS X 10.4 includes iCal version 2.0, which is the version that will open when you double-click an iCal file.

Published Date: Oct 11, 2016

iSync 2.0: Sync stops if you quit iSync while syncing a PalmOne Treo 650

This article has been archived and is no longer updated by Apple.

If you quit iSync 2.0 (included with Mac OS X 10.4 Tiger) while it's syncing with a PalmOne Treo 650, the sync stops, though no alert message will appear—no data will be lost either. If this happens, open iSync 2.0 and sync again (click the sync button on your Palm device's cradle or use Palm HotSync), and let the sync finish.

Changes to scoring markers from Final Cut Pro are not updated in Soundtrack Pro

This article has been archived and is no longer updated by Apple.

When you open a Final Cut Pro-created movie in Soundtrack Pro, you may come across a situation where your score makers don't appear in Soundtrack Pro. This can happen if you open a Final Cut-exported movie with score markers in Soundtrack Pro, delete the file, go back to the original movie project in Final Cut Pro, edit or add score markers, re-export the movie with the same name, and then open the file in Soundtrack Pro again. Soundtrack Pro will not show any changes or additions you made to the markers.

To avoid this issue, change the name of the movie when you re-export it from Final Cut Pro. Then open the renamed movie in Soundtrack Pro.

iPhoto: Sharpness adjustment may not be apparent when viewing at less than 100 percent

This article has been archived and is no longer updated by Apple.

When you view an image at less than full size, iPhoto smooths it (a technique known as anti-aliasing) to get rid of artifacts that result from scaling down the photo. The relationship between anti-aliasing and sharpening is a trade-off; although anti-aliasing does not modify the actual image file, it does counter the effect of sharpening when viewing the image at less than full size.

Because of this, if you sharpen a photo, close it, then reopen it again at a less than 100-percent view, you may get the impression that your sharpness changes were not saved. In reality they were, but since the image has been re-aliased to fit your screen, the image's true sharpness may not be apparent.

To evaluate whether an image is sharp or needs sharpening, you should view the photo at 100 percent/full size while editing in a separate window. To open the photo in a separate window, you can either Control-click the image and choose "Edit in a separate window" from the shortcut menu, or change your iPhoto preferences:

1. From the **iPhoto** menu, choose **Preferences**.
2. In the General pane, locate the preference for "Double-click photo."
3. Set the radio button to "Opens photo in edit window."
4. Close the preferences window.

Now photos will open in a separate window when you double-click them. Once in the separate window, choose **100%** from the **Size** pop-up menu. If you don't see the Size menu, widen the window until it appears.

Tip: If you are editing the photo from one of the other view options, you can press the 1 key to quickly jump to 100 percent view.

Other applications, such as Adobe Photoshop, handle anti-aliasing differently, so the degree of apparent sharpness can vary from one application to the next when viewing an image at a scaled-down size. You should see consistency when comparing the image at 100 percent across other applications.

Logic Pro 7.1: Enhancements included in the Logic Pro 7.1 Upgrade Kit

This article has been archived and is no longer updated by Apple.

The Logic Pro 7.1 update adds a generous collection of new features and sought after enhancements such as full native plug-in delay compensation and over 70 new key commands. It provides greater facility for creating and managing Apple Loops and a convenient new method for re-ordering Channel Strip plug-in configurations. Logic Pro 7.1 further extends the creative options with 5 new plug-ins including a Bass Amp and two hybrid synthesizers. The update is rounded out by a host of optimizations and refinements that significantly improve the performance and stability of both Logic Pro and the included, updated version of Waveburner.

Full enhancement list

For a full list of enhancements, check out our Logic 7.1 Enhancement PDF. For a quick overview of the top ten, keep reading here.

Top ten reasons to upgrade

1. Expanded Apple Loops Integration
Produce your own software instrument Apple Loops using any Logic Pro or Audio Unit plug-in. Place the software instrument Apple Loops onto an Audio Instrument track and the original MIDI performance and Channel Strip configuration is completely restored. Convert your ReCycle (REX) files into Apple Loops by simply dragging them into the Arrange window. Find your Apple Loops more easily by limiting which Jam Packs or other loop collections you wish to browse.

2. Full Native Plug-In Delay Compensation
Take advantage of full plug-in delay compensation which now corrects for latency produced on bus, auxiliary, and output channels in addition to every other path in the native audio mixer. You'll especially appreciate this enhancement if you own third party DSP cards like those developed by Universal Audio and TC Electronics.

3. New Instrument and Effect Plug-Ins
Add beef and character to your bass or other instruments with a new Bass Amp plug-in which replicates the sound of the industry's sweetest bass amplifiers and direct boxes. Tighten up any performance using the Enhanced Timing plug-in or be inspired by the massive atmospheric synth textures produced by two new Hybrid Synth instruments.

4. Hand Tool in Track Mixer
Freely move, copy and swap plug-ins between Channel Strip Inserts using the new Hand Tool in either the Arrange window or Track Mixer.

5. Over 70 New Key Commands
Speed up your workflow by assigning up to 70 new key commands to your favorite functions, including many of those introduced in 7.0 such as Open Loop Browser, Next/Previous Channel Strip, Create Multiple Tracks, Import Audio Files, and Bounce.

6. Numerous Plug-In Improvements
Swap, copy, and import Ultrabeat voices and sequences using a simple drag and drop operation. Export Ultrabeat patterns directly to the Arrange window also using drag and drop. Create or edit EXS24 instruments more easily using rubber-band selection of Zones and the ability to define Start Note and Width settings when importing multiple samples. Exploit new options for the Rotor effect in the EVB3, which also now has improved integration with the Hammond Suzuki XB-1, XK-2, and XK-3 hardware Drawbar controllers. Enjoy many other useful refinements made to Sculpture, Vocal Transformer, Pitch Correction and other plug-ins.

7. Support for 9 additional Control Surfaces
Increase your choices for compatible hardware control surfaces thanks to dedicated support for these 9 popular controller devices: Korg KONTROL49 and MicroKONTROL, Frontier Design Groups Tranzport, Tascam US-2400 and FW-1082, JL Cooper CS-32 and FaderMaster 4/100.

8. Follow Tempo Option for Recorded Audio
Enable the new "Follow Tempo" Region parameter for any audio recorded into your song, and Logic will time and pitch shift the file when you change the song's tempo or key.

9. Insert Chords from Chord Track
Simplify the process for placing chords in lead sheets using a new option which imports the chords from the Global Chord Track.

10. Multiple Performance Enhancements
Streamline your entire workflow as a result of numerous general optimizations and performance enhancements found in Logic Pro 7.1. Highlights include accelerated waveform overview creation, speedier initialization of Audio Units plug-ins during startup, the option to add files to the Audio Window after many audio file functions, improved handling of XML, AAF, and OMF file transfers, and more.

Note: Logic Pro 7.1 is available as a USD 19.95 upgrade to all Logic Pro users possessing an XSkey authorized for Logic Pro 7.0 (pricing may

vary in other regions).

Soundtrack Pro: Touch mode automation does not work as expected when cycling

This article has been archived and is no longer updated by Apple.

In Soundtrack Pro, automation may not work as expected when you cycle a region and use Touch mode automation.

When Soundtrack Pro writes automation in Touch mode while a region is set to cycle, it won't write a held parameter value after the end of the playback region has been reached. The old automation data remains after the playhead loops back to the start of the playback region.

To avoid this, turn off cycling before using Touch mode automation.

Motion 2: New filters

This article has been archived and is no longer updated by Apple.

Motion 2 contains more than 130 GPU-accelerated filters and effects in its Library to use in your projects, including 16 brand new filters. Here's a look at what these new filters can do for you.

Extrude—Simulates depth in an object with an alpha channel by creating an object "front" and "back," offsetting them, and extruding the edges so that they connect.

Indent—Gives a shiny, bump-mapped appearance to an image, with raised and flat areas.

Refraction—Creates a glass-distortion effect on an image, with an optional height map.

Relief—Creates a 3D height map by using the color values of an object or height map to calculate height vertices.

Basic 3D—Allows you to rotate an object on the X, Y, and Z axes, and set its position and perspective.

Prism—Blurs and refracts an image as if seen through a prism, creating a rainbow effect.

Channel Swap—Substitutes the color value of a channel with that of either a selected channel or its inverse. If you select Blue from Red, the blue value in the object will match the red value across the entire object. Channel Swap can be used in a variety of ways, including simply inverting an object's alpha channel.

Gradient Colorize—Colorizes an image using color values instead of position to determine the application of the colors in the gradient.

Vectorize Color—Makes an object appear as multicolored polygons. It substitutes four colors over the entire color range of the object.

Earthquake—Creates an animated displacement effect on an object, adjusting its position as if it was being shaken by an earthquake.

Matte Magic—Erodes and feathers matte edges.

Vignette—Simulates the light fall-off and corner blurring in images as seen through some camera lenses.

Random Tile—Tiles an object in an irregular pattern with circular panels.

Scrub—Moves a virtual playhead around a clip, allowing you to change the timing of the clip without moving it in the Timeline. You can also use this filter to create a freeze frame. Additionally, it allows you to animate the offset parameter, often with interesting results. Try adding the Scrub filter to a clip, then applying the Randomize behavior to the Frame offset with the "Offset from" parameter set to Current Frame.

Trails—Draws light or dark motion trails that follow an object's movement. This is only effective with moving images.

Reduce Banding—Adds a small amount of noise to the pixels of an object, often used to soften the banding seen on 8-bit images with subtle gradients. This filter used to be called Noise Dither.

Bonus Filters—You can download three additional new filters by registering your copy of Motion. You can register by launching the application or registering online. Once registration is complete, go here to download the additional filters. These new filters are:

- **Insect Eye**—Maps a repeating hexagonal distortion pattern to an image, mimicking the point of view of an insect.
- **Movement Blur**—Creates blur based on the movement of subjects in the footage itself. This is different than motion blur, which blurs an animated object in the Canvas.
- **Underwater**—Applies an animated distortion to your object, as if it was being viewed through a water surface.

Motion 2: Learn about the Replicator

This article has been archived and is no longer updated by Apple.

A new feature of Motion 2 is the Replicator, an amazing pattern-based design tool. Replicator lets you automatically generate and animate multiple copies of a single graphic, shape, or movie. Motion 2 includes over 100 Replicator presets.

The Replicator is a powerful new tool that allows you to quickly and fluently build patterns of repeating elements, including video, still images, shapes, or other objects in a Motion project. The patterns are built on a shape that you select, such as a circle, spiral, or rectangle. Once the Replicator shape is determined, you can modify and animate the parameters specific to that shape, such as the size of a circle or the amount of twist in a spiral's arms. You can also modify and animate the pattern's cell parameters. The Replicator also has a special behavior called Sequence Replicator that allows you to sequence the replicator parameters over the pattern. This behavior is very similar to the Sequence Text behavior in the Text Animation behavior subcategory.

For more information, in the Motion **Help** menu choose **Motion User Manual** and see Chapter 9, "Using the Replicator."

Soundtrack Pro unexpectedly quits when saving longer looping clips

This article has been archived and is no longer updated by Apple.

Note: This issue is resolved in Soundtrack Pro 1.0.3. This update is recommended for all Soundtrack Pro customers. Use Software Update or download updates here.

After recording a take in Soundtrack Pro, the application may quit unexpectedly when you try to save the clip as a looping clip. This can occur if your audio is longer than 30 seconds, and you Control-click the recording, choose **Save Clip As** from the pop-up menu, then select the Looping button in the Save Clip As dialog.

To avoid this issue, do not save clips that are longer than 30 seconds as looping clips. The same issue may occur if you try to change one or more one-shot clips, longer than 30 seconds, to looping clips using the Apple Loops Utility.

Published Date: Oct 11, 2016

Motion 2: MIDI controller support

This article has been archived and is no longer updated by Apple.

Motion 2 features MIDI behavior, which allows you to edit and animate object parameters using the various controls (such as knobs, sliders, keys, and so on) on a standard MIDI device, such as a keyboard synthesizer.

You can "teach" Motion which control on the MIDI device manipulates what parameter to which the MIDI behavior is applied. Here are the different components of MIDI controller support in Motion 2. For more information, choose **Motion User Manual** from the Motion **Help** menu, and see the "MIDI" section in Chapter 5: Using Behaviors.

Dashboard Controls

The Dashboard controls allow you to adjust the Control Type, ID, Value, Scale, and parameter assignment shown in the Inspector.

Parameters in the Inspector

Control Type
Specifies the type of control being used on the MIDI device. The three available control types are Note, Controller, and Learning:

- **Note**: This mode indicates that a keyboard key on the MIDI device is the control.
- **Controller**: This mode indicates that a knob, dial, key, slider, or foot pedal on the MIDI device is the control.
- **Learning**: This mode allows you to "teach" Motion which control (such as a knob, slider, or key) you want to use on the MIDI device to manipulate the parameter to which the MIDI behavior is applied. In Learning mode, the first knob, slider, key, or other control that you adjust gets set as the control. **Note**: When you first apply MIDI behavior, "Learning" is the default control type.

ID
Displays the identification number of the MIDI control (the knob, slider, key, or what have you) that you are using.

Value
When you manipulate the control, this displays the standard MIDI value between 0 and 1.

Scale
Increasing the Scale value multiplies the Value parameter in the MIDI behavior. This means that when Scale is increased, the MIDI control has a larger value range and a greater effect on the parameter it's controlling. For example, if you're using a knob to adjust an object's rotation and let's say the default rotation value range (when Scale is set to 1) for a full knob rotation is 30 percent, if you increase the Scale value to 13, the rotation value of a full knob turn will be increased to 370 degrees.

Apply To
The **Apply To** pop-up menu (parameter assignment control) shows the parameter being affected, and can be used to reassign the behavior to another parameter. The MIDI behavior is applied in the same way as all other Parameter behaviors.

Note: This behavior can only be used if you have a MIDI device properly connected to your computer.

Scripts folder not created during Soundtrack Pro installation

This article has been archived and is no longer updated by Apple.

Note: This issue is resolved in Soundtrack Pro 1.0.1 and later. Update to the latest version of Soundtrack Pro for best performance. Use Software Update or download updates here.

If there isn't already a "Scripts" folder at ~/Library (where "~" is your home folder), Soundtrack Pro does not create one during installation. Because of this, when you create an AppleScript in Soundtrack Pro and try to save it, the save path won't point to ~/Library/Scripts because a "Scripts" folder does not exist there. If you save it anyway, you won't be able to access the script through the AppleScript menu.

To resolve this issue, in Soundtrack Pro, choose **Open Scripts Folder** from the **AppleScript** menu. This will create a Scripts folder in your home folder's Library folder (~/Library/Scripts) and a Soundtrack Pro subfolder within it. Now any AppleScripts you create in Soundtrack Pro will have the path, ~/Library/Scripts/Soundtrack Pro.

DVD Studio Pro 4: Updating rendered Final Cut Pro reference movies

This article has been archived and is no longer updated by Apple.

You can import Final Cut Pro reference movies (those that are not self-contained) into your DVD Studio Pro projects, but if any part of the Final Cut Pro sequence requires rendering, you must render it before importing the movie.

Keep in mind that if you need to make a change to a rendered portion of the movie, you must render it again in Final Cut Pro, re-export the movie using the same name, then overwrite the previous reference file. When you go back to DVD Studio Pro, a dialog appears, noting that the movie has changed and that the DVD Studio Pro project has been updated to use the new movie.

This applies to any reference movie that you import into DVD Studio Pro 4 from Final Cut Pro 4, Final Cut Pro HD, or Final Cut Pro 5.

New features in Apple Qmaster 2

This article has been archived and is no longer updated by Apple.

Apple Qmaster 2 includes some new features, enhancements, and changes. Here's an overview of some of the most significant features. For more information on these features and their use, see the Apple Qmaster 2 User Manual and the Distributed Processing Setup guide.

Shared Cluster Storage

This new feature offers automated and simplified shared storage devices set-up. Cluster administrators can select a directory for cluster storage use, and computers in the cluster will automatically access this location, as needed. Compressor users have additional options for how data is stored and transferred.

QuickClusters and Unmanaged Services

Apple Qmaster QuickClusters offer a simple and automated way to create and configure clusters, and an alternative to creating and configuring clusters manually with Apple Qadministrator. QuickClusters simplify the distributed processing set-up process for beginners. They also offer a powerful solution for more advanced distributed processing through extended node clusters. QuickClusters with enabled, unmanaged support autoconfigure themselves and use any available unmanaged services.

An unmanaged service will remain dedicated to its QuickCluster only long enough to finish the current job. Once the current job is complete, the unmanaged service is once again a "free agent," and will advertise its availability to all QuickClusters. You can open a calendar interface and schedule the availability of any particular computer as a processing node in your distributed processing system.

Generic Render Command Plug-in

This plug-in handles distributed processing for projects from other frame-based rendering applications (such as After Effects and LightWave). The plug-in dialog provides you with a convenient way to adjust common settings and to add more command-line options to each job.

Preflight Scripts

The preflight script feature allows you to run a script on each cluster node prior to actually processing a batch. These scripts are sent with every distributed segment of a job. Preflight scripts are an enhancement to the Environment Variable feature that you can use to set or change an environment variable for submitting certain batches or jobs, such as setting directory paths for Apple Qmaster jobs.

Serialized Jobs

You can now specify that some jobs in a batch are dependent on others. This "serialize" feature executes jobs in exactly the order in which they appear in the batch list. For example, if you have a Shake script that requires the output of a Maya script, you can ensure that the Shake script does not execute until the Maya script is done.

Distributed Rendering of QuickTime Output Nodes

With Shake 4, Apple Qmaster 2 builds on its Shake-to-QuickTime conversion capability by now offering Shake-to-QuickTime distributed rendering, which creates a single QuickTime output file.

Persistent Queues

Apple Qmaster now stores batch lists on disk, so that in the event of a restart, the job queue is maintained.

User Interface Enhancements

Apple Qmaster 2 has visual consistency with the Final Cut Studio suite of professional media creation tools, as well as numerous interface enhancements, including:

- The Apple Qmaster pane in System Preferences has been completely revised for more flexibility and a streamlined workflow.
- An email notification button to set (or reset) an email address to which the status of a Batch completion or failure can be sent.
- A stepper tool in the Delay pop-up menu that allows you to enter a wider range of delay times.
- A new column in the History table that indicates progress of each history item.

Apple Qmaster 2 currently ships with Final Cut Pro Studio and DVD Studio Pro 4.

Safari 1.3 or later: Save Image command in shortcut menu has been updated

This article has been archived and is no longer updated by Apple.

When you Control-click (or right-click) an image in Safari 1.3 or later, you may notice that the "Save Image As" command in the shortcut menu has changed from previous versions of Safari.

Before Safari 1.3, when you chose **Save Image As** from the shortcut menu, you got a standard save dialog. In Safari 1.3 or later, the menu now includes a "Save Image" option that names your default download location in the menu. For example, the menu would say "Save Image to the Desktop" if you haven't specified a different default download location.

You can still access the "Save Image As" command if you want—just press the Option key after opening the menu.

Published Date: Feb 19, 2012

Safari: Using the "Open in Tabs" command from the Bookmarks menu

This article has been archived and is no longer updated by Apple.

If you've added both bookmarks and folders of bookmarks to your Bookmarks menu in Safari, and have Tabbed Browsing enabled in Safari preferences, when you choose **Open in Tabs** from the **Bookmarks** menu, the outcome will depend on which version of Safari you have.

In Safari 1.3 and later (version 1.3 is included with Mac OS X 10.3.9; 2.0 or later is included with Mac OS X 10.4 "Tiger"), the "Open in Tabs" behavior is different than in previous versions of Safari. Prior to Safari 1.3, choosing this command from the Bookmarks menu would open only the individual bookmarks that appeared in the menu, and not the ones contained in your folders or subfolders in the menu.

In Safari 1.3 and later, this command opens both the individual bookmarks and those contained in folders. Therefore, choosing this command directly from the Bookmarks menu isn't a good idea if you have a lot of folders with lots of bookmarks in your Bookmarks menu. Here are a couple of ways to adjust to this new behavior:

- Reorganize your Bookmarks menu so that only the items you want to open from it reside there.
- Choose **Open in Tabs** from the submenu of an individual folder in the **Bookmarks** menu. Only the bookmarks inside of that folder will open in tabs.

Note: The "Open in Tabs" command will not appear in the Bookmarks menu if you haven't selected the Enable Tabbed Browsing checkbox in Safari preferences.

Xsan: Requirements for upgrade to Tiger

This article has been archived and is no longer updated by Apple.

To upgrade the operating systems of an Xsan installation to Mac OS X 10.4 "Tiger," you must have the Xsan 1.1 Update or later and the Mac OS X 10.4.1 Update or later.

See "How to use the Xsan 1.1 Updates."

Published Date: Oct 11, 2016

DVD Studio Pro 4: Use 720p HDV video for multi-angle projects

This article has been archived and is no longer updated by Apple.

When authoring a multi-angle or mixed-angle HD DVD project in DVD Studio Pro 4, the video streams in the track are limited to a combined maximum bit rate of 24 Mbps (this includes the selected video stream plus all audio and subtitle streams). 1080i HDV video uses a bit rate of 25 Mbps, which is higher than the maximum allowable multi-angle bit rate in the HD DVD specification.

It is possible to create a multi-angle project with HDV video if you use 720p HDV video, which uses a bit rate of 19 Mbps, depending on the number and type of audio and subtitle streams you use.

Mac OS X 10.4: Some Xerox printers may require newer PPDs

This article has been archived and is no longer updated by Apple.

Some Xerox printer models may be unable to print using the PPD (PostScript Printer Description) files included with a Mac OS X 10.4.0 Tiger installation. If your printer is affected, it may print out the following error message instead of the expected document:

> ERROR: undefined
> OFFENDING COMMAND: COMMENT
> STACK:

This issue can occur with these printers:

- Xerox Document Centre 420
- Xerox Document Centre 425
- Xerox Document Centre 426
- Xerox Document Centre 430
- Xerox Document Centre 432
- Xerox Document Centre 440
- Xerox Document Centre 460
- Xerox Document Centre 470
- Xerox Document Centre 480
- Xerox Document Centre 490
- Xerox Document Centre 535
- Xerox Document Centre 545
- Xerox Document Centre 555
- Xerox WorkCentre M165
- Xerox WorkCentre M175
- Xerox WorkCentre M35
- Xerox WorkCentre M45
- Xerox WorkCentre M55
- Xerox WorkCentre Pro 165
- Xerox WorkCentre Pro 175
- Xerox WorkCentre Pro 32 Color
- Xerox WorkCentre Pro 35
- Xerox WorkCentre Pro 40 Color
- Xerox WorkCentre Pro 45
- Xerox WorkCentre Pro 55
- Xerox WorkCentre Pro 65
- Xerox WorkCentre Pro 75
- Xerox WorkCentre Pro 90
- Xerox WorkCentre Pro C2128
- Xerox WorkCentre Pro C2636
- Xerox WorkCentre Pro C3545

To resolve this issue, download and install the latest version of your printer's PPD file from the Xerox website. After installing the PPD, remove the printer and then add it again using either the Print & Fax pane in System Preferences or Printer Setup Utility. Follow the instructions included with the downloaded file to ensure that the PPD and any plugins that it needs are installed correctly.

Note that this issue and document don't apply to Macs with Mac OS X 10.4.2 or later preinstalled, or to Mac OS X 10.4.2 or later installation discs.

Mac OS X 10.4: TextEdit list may appear to lose content

This article has been archived and is no longer updated by Apple.

With Mac OS X 10.4, if you use the List feature in TextEdit to create a list, it's possible that some or all of your list content may disappear after saving and reopening the document. Update to Mac OS X 10.4.1 or later to avoid this issue.

When this happens with Mac OS X 10.4, your list may be truncated or missing. This can happen with rich text documents (those with a .rtf or .rtfd file extension) and certain combinations of lists and font choices.

You can create a TextEdit List by clicking the **Lists** pop-up menu at the top of a TextEdit document, or from the **Format** menu, choose **Text**, then **List**.

Important: If your TextEdit document list is missing or has been truncated, please note that the content isn't actually gone; it's just not visible to you. However, if you save the document again, the invisible information will indeed be lost.

For example, if you create the following list in a TextEdit document in Mac OS X 10.4...

- first
- second
- third

... then save the document and open it again, you might only see this:

-

The saved document list appears to have been truncated, but it's actually not (unless you save it again—so don't do that!).

The best way to avoid this issue is to not use the TextEdit List feature in Mac OS X 10.4 until you've updated to Mac OS X 10.4.1 or later.

Tip: You can remove all lists from a TextEdit document by choosing **Select All** from the **Edit** menu, then selecting **None** from the **Lists** pop-up menu. Please note that this doesn't recover lost text, unfortunately.

Again, you can avoid this issue by downloading and installing the Mac OS X 10.4.1 Update, or later, from Apple Downloads.

DVD Studio Pro 4: DTS audio formats

This article has been archived and is no longer updated by Apple.

DVD Studio Pro 4 supports additional Digital Theater Systems (DTS) audio formats.

You can now use DTS ES audio that contains up to 6.1 channels, as well as audio that has up to a 96 kHz sample rate and 24-bit sample size.
Important: All DTS audio imported into DVD Studio Pro must use the compacted file format (files with a ".cpt" file extension).

Note: All DTS audio files that you import into a DVD Studio Pro project must use at least a 48 kHz sample rate. DTS files with a 44.1 kHz sample rate produce unusable results.

Mac OS: Digital Audio & MIDI Software Installation (PACE Copy Protection)

This article describes PACE copy protection, and its interaction with Mac OS 8 and Mac OS 9.
This article has been archived and is no longer updated by Apple.
There are some applications (primarily high-end digital audio and MIDI applications) which rely on a Key Disk authorization scheme known as PACE. Essentially, PACE writes a code number to the hard drive which is then verified each time the application is launched.

Newer PACE-protected applications use the current PACE protocol referred to as "interlok" which installs flawlessly with Apple's Mac OS 8 release. Some applications (Steinberg's Cubase VST 3.5 and earlier, other older Steinberg PACE protected applications and Digidesign's SoundDesigner 2.82 and earlier) use the older, pre-interlok PACE authorization protocol called PACE III. During the install of one of these specific applications, pre-interlok PACE III will perform an expansion of the application. This expansion conflicts with Mac OS 8, preventing the proper installation of pre-interlok PACE III applications over Mac OS 8.

The good news is that it's an expansion issue, not an authorize/de-authorize issue. If the user does a dirty install of Mac OS 8 where the PACE III protected application has already been installed, the upgrade will work fine and the user will gain all the benefits of Mac OS 8. A user could even de-authorize the PACE protected application, do a clean install of Mac OS 8 and then re-authorize the application and all would still be fine (assuming all appropriate extensions are manually moved from the previous system to the new Mac OS 8 system).

Simply put, everything should work fine as long as the PACE III protected application is installed (expanded from its tome) before the Mac OS 8 install. Most applications that use the PACE key disk authorization protocol have upgraded to the new "interlock" version which works with fresh installs over Mac OS 8. We encourage you to contact the developer of your software to confirm that you have latest version. They will be able steer you through any small issues you might stumble across.

For more information on using PACE protection software and Mac OS 9 or newer Power Macintosh computers, see the PACE Anti-Piracy web site: http://www.paceap.com

iSync 2.0: About canceling a device reset

This article has been archived and is no longer updated by Apple.

iSync 2.0 features Reset Device and Reset All Devices functions that allow you to reset all the information on a connected device, or on all connected devices, to match the information on your computer.

When you select one of these options in iSync 2.0, iSync will display a dialog that asks you to verify your selection. Once you confirm it, the reset process begins and a "Cancel Sync" button appears. If you click "Cancel Sync," the reset gets deferred until the next sync. If you cancel because you want to preserve modified contacts on a device instead of resetting them to what's on the computer, do this before the next sync:

1. Verify that your modified contacts or calendars are still on your device. If you're only preserving minor changes, consider manually making them in Address Book or iCal.
2. In iSync, remove the device.
3. Add your USB or Bluetooth device back into iSync.
4. Before you sync, make sure to select the "Merge data on computer and device" option—not the "Erase data on device then sync" option.

Compressor 2: Advanced image analysis

This article has been archived and is no longer updated by Apple.

Compressor 2 offers high-quality transcoding from many different source formats to many different target formats using advanced image analysis. That means you can now do any of the following at quality levels that were previously only available through expensive hardware solutions:

- Convert video files between international television standards, such as PAL to NTSC, or NTSC to PAL.
- Downconvert high definition (HD) video sources to standard definition (SD), or upconvert SD to HD.
- Convert a progressive stream to an interlaced one, or interlaced to progressive.

Compressor 2 ships with a completely new set of Apple presets, representing a wide variety of workflows such as the standards conversions described here, as well as web delivery, mobile devices, SD DVD, HD-based DVD, professional audio, and motion graphics.

QuickTime 7 and Cleaner 6 incompatibilities

This article has been archived and is no longer updated by Apple.

If you use QuickTime 7 to compress a video file in H.264 format and add it to Cleaner by dragging the file into an Untitled window or using the Add Batch Files command, the preview window won't display any video. This happens because Cleaner doesn't see QuickTime-compressed H.264 video.

This document will be updated when additional information is available. Apple and Autodesk Media and Entertainment are working together to resolve this issue as quickly as possible.

For additional information on Cleaner support, click here.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

QuickTime Player 7: Movie object properties cannot be accessed when movie is in fullscreen mode

This article has been archived and is no longer updated by Apple.

If you have an AppleScript that interacts with QuickTime Player, it may not work if you are watching a movie in fullscreen mode. This happens because property requests aren't processed until a movie has exited fullscreen mode.

Published Date: Feb 18, 2012

Compressor 2: High resolution audio support

This article has been archived and is no longer updated by Apple.

Compressor 2 supports high resolution audio up to 64 bits per sample (floating point) and sample rates up to 192 kHz. If you have disk space or bandwidth limitations, you must compress your audio. Do note that audio takes up less disk space than video, so you won't need to compress it as much as video.

The most important components of audio codecs are sampling rates and bit depth. Sampling rate sets the sound quality; bit depth sets the dynamic range of the sound. QuickTime audio codecs allow you to set both the sampling rate and size of your source media file.

Published Date: Oct 11, 2016

Motion 2: Supported file formats

This article has been archived and is no longer updated by Apple.

Motion allows you to use a wide variety of video, still image, and audio files within a single project. Since it's a QuickTime standard application, Motion supports many of the same file formats that QuickTime does.

QuickTime video codecs

Motion supports QuickTime video files using nearly any video codec installed on your computer, including, but not limited to:

- Animation
- BMP
- Cinepak
- Component Video
- DV - PAL
- DV/DVCPRO - NTSC
- DVCPRO - PAL
- DVCPRO HD 1080i50, 1080i60, and 720p60
- DVCPRO50 - NTSC
- DVCPRO50 - PAL
- Uncompressed 8- and 10-bit 4:2:2
- Graphics
- H.261
- HDV 1080i50, 1080i60, and 720p30
- Apple Intermediate Codec
- Motion JPEG A and JPEG B
- MPEG IMX 525/60 (30Mb/s, 40 Mb/s, 50 Mb/s)
- MPEG IMX 625/50 (30Mb/s, 40 Mb/s, 50 Mb/s)
- MPEG-4 Video
- Photo - JPEG
- Apple Pixlet Video
- Planar RGB
- PNG
- TGA
- TIFF
- VC H.264
- Video
- H.263
- H.264
- JPEG 2000
- Sorenson Video 3
- Sorenson Video

Still image formats

Motion supports most commonly used still image file types, including:

- SGI
- Photoshop
- BMP
- JPEG
- PICT
- PNG
- MacPaint
- TIFF
- TGA
- JPEG-2
- QuickTime Image Files
- Open EXR

Other image formats

In addition, Motion includes special support for the following image types:

- Layered Photoshop files
- PDF files

Audio formats

You can import audio files with sample rates up to 192 kHz, and with bit depths up to 32 bits. Motion supports mono, stereo, and multi-channel audio files in any of the following audio formats:

- WAV
- AIFF
- .cdda
- MP3
- AAC (AAC files are listed in the Finder with the .m4p file extension.)
- QuickTime Audio, with support for the following audio codecs:
  - 8-bit
  - 8-bit Unsigned (Little Endian/WAV)
  - 16-bit Integer
  - 24-bit Integer
  - 32-bit Integer
  - 32-bit Float
  - 64-bit Float
  - ALaw 2:1
  - AMR Narrowband
  - Apple Lossless
  - IMA 4:1
  - MACE 3:1
  - MACE 6:1
  - MPEG-4 Audio

Important: You cannot import rights-managed AAC files, such as those purchased from the iTunes Store.

For more information about the file formats supported by Motion, visit the Motion website.

Published Date: Oct 11, 2016

Motion: Image sequences must contain three or more digits in each filename

This article has been archived and is no longer updated by Apple.

You can import an image sequence into Motion as long as each file in the sequence contains three or more numerical digits in its filename; for example, image.001.tif, image.002.tif, image.003.tif, and so on—or file00001.jpg, file00002.jpg, file00003.jpg, and so on.

Image sequences store video clips as individual still image files. Each image has a number in its filename that indicates where it fits into the sequence. In a film clip that's been digitally scanned, each file represents a single frame. In a video clip that's been converted to an image sequence, each file contains both fields of a single video frame, with the upper and lower lines of the image saved together.

Image sequences can come in the same file formats as still image files. Some of the most popular formats for saving image sequences are:

- SGI
- BMP
- JPEG
- TIFF
- TGA

Like still image formats, many image sequences support alpha channels, which are automatically used by Motion. Because image sequences have been around for a long time (before QuickTime, they were the only way to store video on a computer), they remain the lowest-common denominator file format for exchanging video across many different editing and compositing applications.

While QuickTime is increasingly used to exchange video clips between platforms, image sequences are still in common use—especially in film compositing. As with QuickTime video clips, you can mix image sequences of different formats, frame sizes, pixel aspect ratios, frame rates, and interlacing.

Motion: Don‘t use an alias for third-party plug-ins

This article has been archived and is no longer updated by Apple.

Motion supports third-party After Effects-compatible plug-ins. But if you create an alias for any third-party plug-in, the plug-in won't be recognized in Motion or Motion 2. However, you can tell Motion where to find these plug-ins so that they appear in the 3rd Party Filters category of the Library. Here's how:

1. Choose **Motion > Preferences** (or press Command-,).
2. Click General.
3. In the "3rd Party Plug-ins" group, click Choose (next to Search Path).
4. In the resulting window, navigate to the folder that contains your third-party plug-ins, then click Choose. A message appears, informing you that the path has changed and that it will take effect the next time you open Motion.
5. Quit and reopen Motion.

The third-party plug-ins now appear in the "3rd Party Filters" category, and can be applied in the same manner as all other filters.

This document will be updated as more information becomes available.

Final Cut Pro 5: Connecting your DV camcorder or deck to your computer

This article has been archived and is no longer updated by Apple.

To capture video footage from a DV camcorder or deck into Final Cut Pro 5, you need to properly connect the device to your computer and turn it on. Once you do, FireWire device control allows Final Cut Pro to control the video device, allowing you to control playback from within the application instead of using the controls on your camcorder or deck.

Here are basic instructions on how to connect a device for video capture using Final Cut Pro. For detailed information, see the documentation that came with your video equipment and your computer. (If you want to output your movie to DV tape after you're finished editing, you'll need to connect the device in the same manner.)

What you need

- A computer and display
- A DV device, such as a DV camcorder or deck
- A 6-pin to 4-pin FireWire cable, available at electronics stores or an Apple Authorized Reseller

Connecting your DV camcorder or deck

1. Turn off your DV camcorder or deck.
2. Connect one end of the FireWire cable to the FireWire port on your computer. Your computer can be turned on during this setup process.
3. Connect the other end of the FireWire cable to the FireWire port on the camcorder or deck.
   Note: On some devices, the FireWire port may be labeled IEEE 1394 or i.LINK. Make sure that you align the connector and port properly by matching the indentation on the connector to the indentation on the port. Do not force the two together.

4. Turn on your camcorder or deck.
5. If you are using a DV camcorder, switch it to VTR (playback) mode.
6. Open Final Cut Pro, then choose **File > Log and Capture**. The Log and Capture window appears. If your device is properly connected, Final Cut Pro displays "VTR OK" at the bottom of this window.
7. To view your video on an external monitor, use an appropriate cable to connect the analog video output (S-Video or Composite) on your DV camcorder or deck to your NTSC or PAL video monitor's input.

8. To listen to the audio through speakers or an amplifier, use an appropriate cable to connect the analog audio output (stereo RCA) on your DV camcorder or deck to the input of self-powered speakers, an amplifier connected to speakers, or an audio mixer. If your mixer or amplifier has a headphone output, you can also monitor audio through headphones.
9. If you prefer to listen to the incoming audio signal through your computer speakers, click the Clip Settings tab in the Log and Capture window and select the Preview checkbox to enable it. This option sends the incoming audio signal to the audio output specified in the Output section of the Sound pane in System Preferences.
10. You're now ready to capture.

For more information about capturing video in Final Cut Pro 5, choose **Getting Started.pdf** from the **Help** menu in Final Cut Pro 5.

Mac OS X 10.4: How to configure older AirPort base stations

This article has been archived and is no longer updated by Apple.

To administer the original AirPort Base Station (Graphite) or second-generation AirPort Base Station (Dual Ethernet) from a Mac OS X 10.4 "Tiger" computer, you must use AirPort Admin Utility.

The version of AirPort Setup Assistant included with Tiger can't be used with the older base stations, and the older version of the assistant cannot be installed on Tiger.

The one exception is if you upgraded your computer from Mac OS X 10.3 with AirPort 4.1 software to 10.4. Under this circumstance, the "AirPort Setup Assistant for Graphite or Snow" may be carried over into 10.4. Though it may remain on your system after an upgrade, it will not actually work. It is left so that you may use it in the event that you "dual boot" your computer. In certain situations, this may also be called "AirPort Setup Assistant for Graphite and Snow."

Note: "Snow" is an alternate name for the second-generation AirPort Base Station (Dual Ethernet).

QuickTime Pro 7: "Save As QuickTime" disabled in web browser after working once

This article has been archived and is no longer updated by Apple.

After you install QuickTime 7 on your computer and install Final Cut Studio or other software that automatically installs a new QuickTime Pro Key, you may come across an issue where you're only able to save a file from your web browser as QuickTime content once before losing that ability. Though QuickTime Pro normally allows you to save any number of movies, you may suddenly see "Pro" icons appear in the shortcut menu next to the **Save As QuickTime** and **Save As Source** menu options.

If you choose **Save As QuickTime**, you'll see the following message, which suggests that you aren't using QuickTime Pro when you actually are:

As a temporary workaround, quit your web browser and then reopen it to reset the QuickTime Plug-in, allowing you to save another movie.

This does not occur with QuickTime Pro keys that are entered manually into the QuickTime pane of System Preferences.

This document will be updated when additional information is available.

About the Mac OS X Server 10.4.1 Update

This article has been archived and is no longer updated by Apple.

This software updates Mac OS X Server version 10.4 to version 10.4.1.

Important: Please Read Before Installing

- You must have an administrator account password that does not contain spaces or Option-keyed characters to install this update. The password may not be left blank. If you need to change your password, follow these steps:
  1. From the **Apple** menu, choose **System Preferences**.
  2. Click Accounts to display the preferences.
  3. Select an Admin account and click Edit User.
  4. Type your current password and press Return.
  5. Type a new password and click OK.

- You may experience unexpected results if you've installed third-party system software modifications, or if you have modified the operating system through other means. This doesn't apply to normal software installation.

- The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Software Downloads to install.

- This update can be installed on non-startup volumes, but you should only do this if the current startup volume has already been updated to Mac OS X Server 10.4.1. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are two ways to update to Mac OS X Server 10.4.1: Use Software Update or install from a standalone installer.

Software Update Installation

Software Update may have referred you to this document. For more information on this feature, see "How to Update Your Software."

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

A standalone installer is also available from Apple Downloads.

Remote Installation

If you need to install the update on a remote computer, you can do so using the "softwareupdate" command-line tool.

Enhancements

The following items are some of the enhancements and improvements in Mac OS X 10.4.1 Server Update:

Software Update Server

- Addresses an issue where the Software Update Service may not automatically download and host mirrored updates.

Open Directory

- Addresses an issue in which users may not be able to add Password Hints to an Access Control List.
- Addresses an issue in which static LDAP binding entries may be lost when bound to a DNS entry which resolves to many IP addresses.
- Addresses startup issues which may prevent computers from fully starting up when bound via Active Directory and hosting multiple services.

Apple File Server

- Addresses an issue in which the Apple File Server may stop unexpectedly when used simultaneously with SMB and CIFS.

servermgrd

- Addresses an issue that may cause the servermgrd service to stop unexpectedly over time with multiple services running.

Weblogs

- Addresses an issue in which user Weblogs may appear to be unavailable, even though they're really still available.

Mail Services

- Addresses mail migration issues in which the mail databases may be located on a different partition separate from where the 10.4.1 install resides. Additional mail database reconstruct instructions may be found here.

Disk Imaging

- Addresses an issue in which Disk Images may not properly uncompress and mount when stored on an Automounted Home Directory

Mac OS X Server 10.4: Software Update Server information reported to Apple

This article has been archived and is no longer updated by Apple.

When you use Mac OS X Server 10.4 to locally host updates as a Software Update Server, it reports certain information back to Apple. In server versions 10.4 to 10.4.2, this information is limited to:

- The update that the client downloaded
- The primary language of the client computer

In Mac OS X Server 10.4.3 and later, the information collected expands to this set:

- Mac OS version of the client
- Hardware model of the client
- Amount of RAM installed in client
- The primary language of the client
- Updates offered by the server
- Updates selected by the client
- Any errors in downloading or installing during the last update attempt

Soundtrack Pro: Space Designer and Audio Waveform Editor

This article has been archived and is no longer updated by Apple.

Although you can use the Space Designer plug-in (included with Soundtrack Pro) in the Audio Waveform Editor, please be aware that it will only function as a realtime effect in multitrack projects and in the audio Waveform Editor. However, if you attempt to bounce realtime effects in the audio Waveform Editor, then Space Designer will not be rendered properly.

Published Date: Feb 18, 2012

Soundtrack Pro does not install the QuickTime MPEG-2 Playback Component

This article has been archived and is no longer updated by Apple.

The Soundtrack Pro installer does not install the QuickTime MPEG-2 Playback Component, which is required for MPEG-2 file playback and the Compressor Preview function. If you need the ability to import and playback MPEG-2 content, you can purchase the downloadable QuickTime MPEG-2 Playback Component, which is available from the Apple Store.

Final Cut Studio also includes the QuickTime MPEG-2 Playback Component.

Mac OS X Server 10.3: Batch-promoted admin can‘t change user password (-14090 error)

This article has been archived and is no longer updated by Apple.

If you use Workgroup Manager to simultaneously promote several users to LDAP directory administrator status, these "batch-promoted" admin users will not be able to change passwords for users that use an Open Directory password. When they try, they will get a -14090 error.

This issue affects Mac OS X Server 10.3 to 10.3.9.

To avoid the issue, promote only one user at a time to administrator status. If you want to verify whether a promoted admin user will be able to change Open Directory user passwords, execute this command in Terminal, where *newadmin* is the short name of the admin user being verified:

```
pwpolicy -u newadmin -getpolicy | awk '{print $2}'
```

If you get a result of `isAdminUser=1`, that admin user can change passwords. If the result is `isAdminUser=0`, demote and then repromote the user in Workgroup Manager. Alternatively, you could use the `pwpolicy` command to set the isAdminUser attribute to 1.

Mac OS X 10.4: Address Book "Smart Groups" are not synced

This article has been archived and is no longer updated by Apple.

If you're using Mac OS X 10.4 Tiger, please note that Smart Groups that you create in Address Book are not syncable, even though many other types of contact information are.

Because of this, you may notice that when you select a device in iSync, you can't choose any Smart Groups from the **Contacts-Synchronize** pop-up menu.

As a workaround, create a regular group (not a Smart Group) of contacts in Address Book that's just for iSync syncing. Add the contacts that you want synced to this group. Then choose that group as the one to sync in iSync.

Note: Any contacts you create on your phone or other devices will still show up in relevant Address Book Smart Groups if that contact meets the Smart Group's criteria.

About Security Update 2005-005

This article has been archived and is no longer updated by Apple.

This document describes Security Update 2005-005, which can be downloaded and installed using Software Update, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred, and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How To Use The Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Security Update 2005-005

- **Apache**
  CVE-ID: CAN-2005-1344
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  Impact: The htdigest program contains a buffer overflow, which if used improperly in a CGI application, could allow a remote system compromise.
  Description: The htdigest program could be used in a CGI application to manage user access controls to a web server. htdigest contains a buffer overflow. This update fixes the buffer overflow in htdigest. Apple does not provide any CGI applications that use the htdigest program. Credit to JxT of SNOsoft for reporting this issue.

- **AppKit**
  CVE-ID: CAN-2004-1308, CAN-2004-1307
  CERT: VU#125598, VU#539110
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  Impact: An integer overflow in the handling of TIFF files could permit arbitrary code execution.
  Description: A malformed TIFF image could contain parameters that result in image data overwriting the heap. This issue has been addressed by adding additional tests when calculating the space needed for an image.

- **AppKit**
  CVE-ID: CAN-2005-1330
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  Impact: A Cocoa application will quit through an unhandled exception from NXSeek().
  Description: A malformed TIFF image can cause a call to NXSeek() with an offset outside the image. This raises an exception which is not handled. The default handler then causes the application to exit. This update causes an error to be returned to the application. Credit to Henrik Dalgaard of Echo One for reporting this issue.

- **AppleScript**
  CVE-ID: CAN-2005-1331
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  Impact: Scripts created using the applescript: URI mechanism could display code differently than that which would actually run.
  Description: The applescript: URI mechanism is a feature that allows AppleScript code to be distributed via a hyperlink. When an applescript: URI is clicked, the AppleScript Editor opens and displays the code that has been downloaded. If the code is then compiled and run, it may not execute exactly as it is displayed. This issue has been addressed by rejecting URIs containing characters that could be used to mislead the user. Credit to David Remahl of www.remahl.se/david for reporting this issue.

- **Bluetooth**
  CVE-ID: CAN-2005-1332
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  Impact: Bluetooth-enabled systems may allow file exchange without prompting users.
  Description: The Bluetooth file exchange service is enabled by default on systems with Bluetooth capability. This could allow files to be shared without properly notifying the user. In addition, the default directory for file sharing may be used by other applications, leading to unintentional file sharing. Security Update 2005-005 disables Bluetooth file exchange and changes the location of the default transfer directory on systems where the old default directory is set. In addition, new users of a system must now enable Bluetooth file exchange before it is allowed. Users with Bluetooth-enabled systems should read this article for more information on the changes provided by this update. Credit to kf_lists[at]digitalmunition[dot]com for reporting this issue.

- **Bluetooth**
  CVE-ID: CAN-2005-1333
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9

Impact: Directory traversal via Bluetooth file and object exchange.
Description: Due to insufficient input checking, the Bluetooth file and object exchange services could be used to access files outside of the default file exchange directory. Security Update 2005-005 addresses this issue by adding enhanced filtering for path-delimiting characters. Credit to kf_lists[at]digitalmunition[dot]com for reporting this issue.

- **Directory Services**
  CVE-ID: CAN-2005-1335
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  Impact: chfn/chpass/chsh could be manipulated to give privileges to an unprivileged user.
  Description: chfn/chpass/chsh is a hard-linked set of SUID programs. Certain code paths use external helper programs in an insecure manner which could lead to a privilege escalation. This update provides secure mechanisms for running helper programs.

- **Finder**
  CVE-ID: CAN-2005-0342
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  Impact: Unsafe handling of .DS_Store files could be used by local attackers to overwrite files and lead to privilege escalation.
  Description: Finder uses .DS_Store files to store and retrieve information used to display folders on the system. When writing these files, Finder could follow a link resulting in the overwrite of an arbitrary file. In addition, these files could contain data supplied by malicious users, allowing them to gain privileges by altering system configuration files. Security Update 2005-005 addresses this issue by updating Finder to check that .DS_Store files are not links before writing to them.

- **Foundation**
  CVE-ID: CAN-2005-1336
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  Impact: Buffer overflow via an environment variable for applications using the Foundation framework.
  Description: The incorrect handling of an environment variable within the Foundation framework can result in a buffer overflow that may be used to execute arbitrary code. This issue has been addressed by improved handling of the environment variable.

- **Help Viewer**
  CVE-ID: CAN-2005-1337
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  Impact: Help Viewer could be used to run Javascript without the restrictions normally imposed.
  Description: When Javascript is loaded for a remote site, it is executed in a restricted environment. The environment restrictions are not applied for local Javascript files loaded by the Help Viewer. Security Update 2005-005 addresses this by only allowing Help Viewer to load registered pages. Credit to David Remahl of www.remahl.se/david for reporting this issue.

- **LDAP**
  CVE-ID: CAN-2005-1338
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  Impact: Passwords could initially be stored into LDAP in plain text when using an LDAP server not running on Mac OS X.
  Description: When a system is bound to an LDAP server that has "ldap_extended_operation" disabled or not supported, and new accounts are created using the Workgroup Manager, then the initial password can be stored in the clear. If the password is modified using the Inspector, it will be correctly stored in a hashed form. This issue does not occur when using the Apple supplied Open Directory server. For servers not supporting "ldap_extended_operation," this update now stores new passwords in the hashed form.

- **libXpm**
  CVE ID: CAN-2004-0687 CERT: VU#882750
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  Impact: A vulnerability in the parsing of malformed XPM files could allow arbitrary code execution.
  Description: The xpmParseColors() function in the XFree86 libXpm library contains a vulnerability in the parsing of malformed image files that may lead to a stack overflow, and could allow arbitrary code execution. Images downloaded via a web browser may use the XPM format and allow remote exploitability. libXpm is not installed by default on Mac OS X or Mac OS X Server systems. It is an optional install item via the X11 package. Credit to Chris Evans <chris@scary.beasts.org> for reporting this issue.

- **libXpm**
  CVE ID: CAN-2004-0688 CERT: VU#537878
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  Impact: A vulnerability in the parsing of malformed XPM files could allow arbitrary code execution.
  Description: Multiple libXpm routines contain integer overflow vulnerabilities that may allow an attacker to cause a denial-of-service condition or execute arbitrary code. Images downloaded via a web browser may use the XPM format and allow remote exploitability. libXpm is not installed by default on Mac OS X or Mac OS X Server systems. It is an optional install item via the X11 package. Credit to Chris Evans <chris@scary.beasts.org> for reporting this issue.

- **lukemftpd**
  CVE-ID: CAN-2005-1339

Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
Impact: When using the chroot feature of ftp, users can bypass the restriction by using their full name.
Description: The ftp server allows users to login with either their full name or their short name. In order to restrict users to their home directory, all permitted login names must be listed in /etc/ftpchroot. Users are permitted to change their full name. This issue has been addressed by mapping full names to short names before checking the /etc/ftpchroot restriction list. Credit to Rob Griffiths of macosxhints.com for reporting this issue.

- **NetInfo**
  CVE-ID: CAN-2005-0594
  Available for: Mac OS X Server v10.3.9
  Impact: The Netinfo Setup Tool (NeST) contains a buffer overflow that could permit arbitrary code execution.
  Description: NeST is a SUID tool. It contains a buffer overflow that could permit arbitrary code execution. This update prevents the buffer overflow from occurring. Credit to iDEFENSE Labs for reporting this issue.

- **Server Admin**
  CVE-ID: CAN-2005-1340
  Available for: Mac OS X Server v10.3.9
  Impact: Enabling the HTTP proxy service also enables it for users not on your network if there are no access restrictions.
  Description: When the HTTP proxy service is enabled in Server Admin, it does not restrict which networks can access it. If there are no external access controls, then users on the Internet can also use the proxy. The HTTP proxy service is disabled by default. This update adds a user interface component to Server Admin, which allows the HTTP proxy to be restricted to local networks.

- **sudo**
  CVE-ID: CAN-2004-1051
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  Impact: Bash scripts run via sudo can be subverted.
  Description: Sudo versions prior to 1.6.8p2 do not properly sanitize their environment. A malicious local user with permission to run a bash shell script could exploit this to run arbitrary commands. Apple does not provide any pre-authorized bash shell scripts by default. This issue is addressed by removing bash shell functions from the environment before running subsequent commands.

- **Terminal**
  CVE-ID: CAN-2005-1341 CERT: VU#994510
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  Impact: Malicious input could cause data to be inserted into a user's Terminal command line.
  Description: The Terminal utility allows window titles to be read as input via a particular escape sequence. This could allow malicious content to inject data when it is displayed in a Terminal session. Security Update 2005-005 addresses the issue by removing handlers for this insecure escape sequence. Credit to David Remahl of www.remahl.se/david for reporting this issue.

- **Terminal**
  CVE-ID: CAN-2005-1342 CERT: VU#356070
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  Impact: Escape characters embedded in x-man-page URIs could insert commands into a user's Terminal session.
  Description: The x-man-page URI scheme provides support for displaying manual pages via the Terminal utility. Insufficient validation of these URIs can allow data to be inserted in a Terminal session. Security Update 2005-005 addresses this by adding escape sequence validation to the URI handler. Credit to David Remahl of www.remahl.se/david for reporting this issue.

- **VPN**
  CVE-ID: CAN-2005-1343
  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9
  Impact: A local user can obtain root privileges if the system is
  being used as a VPN server.
  Description: A buffer overflow in "vpnd" could be used by a local user to obtain root privileges if the system is configured as a VPN server. This problem does not occur on systems that are configured as a VPN client. This issue cannot be exploited remotely. This update prevents the buffer overflow from occurring. Credit to Pieter de Boer of the master SNB at the Universiteit van Amsterdam (UvA) for reporting this issue.

Mac OS X 10.4: AirPort may not rejoin network on wake or restart

This article has been archived and is no longer updated by Apple.

Symptom

Some computers, after upgrading to Mac OS X Tiger 10.4, may no longer automatically join a wireless network after waking from sleep or restarting.

This may happen when a computer has been upgraded from an earlier version of Mac OS X, or it may happen if your new computer (running Tiger) has had data imported from an older computer.

Solution

Update your computer to the latest version of Mac OS X Tiger 10.4 using Software Update or by manually downloading the update from http://www.apple.com/support/downloads. After updating Mac OS X, the computer should automatically rejoin the selected network after restarting or waking the computer up.

Mac OS X 10.4: Where does Spotlight search?

This article has been archived and is no longer updated by Apple.

Mac OS X 10.4 Tiger features Spotlight, a lightning-fast search technology that instantly lets you find things on your Mac. By default, Spotlight will index and search in the following locations:

- All Home folders (local and network-based, as well as FileVault and non-FileVault). This includes:
  - The Documents, Movies, Music, and Pictures folders
  - The Trash of all users and each mounted volume.
  - ~/Library/Metadata/
  - ~/Library/Caches/Metadata/
  - ~/Library/Mail/
  - ~/Library/Caches/com.apple.AddressBook/Metadata/
  - ~/Library/PreferencePanes/

- Spotlight also searches these non-Home folder locations by default:
  - /Library/PreferencePanes/
  - /System/Library/PreferencePanes/
  - /Applications

Can Spotlight search anywhere else? Of course! Any new folder you create in your Home automatically gets indexed so that it's searchable. If you connect an external storage device, such as a USB or FireWire hard drive, Spotlight will index the stuff on it, too. (If you want to exclude certain areas from Spotlight searching, see the tip below.)

Note: If your computer has multiple user accounts, any files that reside at the top level of each user's Home folder will also be indexed and searchable by Spotlight, even though they cannot be modified. However, all files and folders located within a user's Desktop, Documents, Library, Music, Movies, and Pictures folders will not be indexed nor can they be searched by other user accounts using Spotlight.

Tip: You can use Spotlight preferences to tell Spotlight which locations not to search, if you wish.

Motion: LiveFont text quality may decrease with Scale slider usage

This article has been archived and is no longer updated by Apple.

In Motion, if you try to increase the size of a LiveFont text object using the Scale slider in the Inspector or one of the scaling handles in the canvas, the text quality will degrade.

If you want to increase the size of LiveFont text objects, use the Size slider instead of changing the scale. You can use the Size slider in the Dashboard or Inspector to increase the size of any text object.

This document will be updated as more information becomes available.

Logic Pro: Bounced files that use DAE produce only static

This article has been archived and is no longer updated by Apple.

If you bounce files in Logic when using DAE (Digidesign Audio Engine), under certain circumstances, the files may produce only static, making them unusable. This issue occurs if you set Logic to use DAE and set the recording format to Wave. In this scenario, bounced files will sound like static, regardless of the format (AIFF, WAV, or SD2) that you select for the bounce.

To resolve this issue, update to Logic Pro version 7.1.1 or later, available at Apple Downloads.

If you can't update immediately, the workaround is to set Logic to use AIFF or SD2 as the recording format. You can then select any format when bouncing.

Published Date: Oct 11, 2016

Logic Pro: "Hardware already in use" message after switching from DAE to Core Audio on TDM system

This article has been archived and is no longer updated by Apple.

If you're using TDM hardware and you switch Logic from using DAE to the Digidesign Core Audio driver (in the Audio Driver window), you'll get an alert message the next time you open Logic that says the Digidesign hardware is already in use.

To resolve this issue:

1. Change the driver in the Audio Driver window.
2. Quit Logic.
3. Open the Digidesign CoreAudio Manager application.
4. Click the Connect button.
5. Open Logic Pro.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

iMac G5 (Ambient Light Sensor): About the Ambient Light Sensor

This article has been archived and is no longer updated by Apple.

The iMac G5 (Ambient Light Sensor) contains an Ambient Light Sensor on the underside of the display bezel that adjusts the brightness of the sleep indicator light according to the level of the surrounding light.

In a dark environment, the sleep indicator brightness decreases; in brighter conditions, the sleep indicator brightness increases. With this behavior, you can tell if the computer is asleep when the room is bright, but the computer's sleep indicator light won't keep you awake at night.

Soundtrack Pro: Can‘t install loop content on NetInfo bound systems

This article has been archived and is no longer updated by Apple.

Under some circumstances, when you try to install Soundtrack Pro loop content on NetInfo bound systems, the installation may not work if you're using Mac OS X 10.3.9.

This issue occurs if the /Library/Audio/Apple Loops folder does not exist on the local system volume. If this happens to you, try any of these workarounds:

- Start up to a local drive, then install the loop content.
- Manually create an Apple Loops folder in /Library/Audio before installing the loop content.
- In the installer, click the Choose button to specify the install folder for the content (be sure to specify the /Library/Audio folder—not just the system volume).

Final Cut Pro 5: Upgrade Frequently Asked Questions

This article has been archived and is no longer updated by Apple.

What version of Final Cut Pro do I need to qualify for the Final Cut Pro 5 upgrade?
You can upgrade from any retail version of Final Cut Pro for only $399, or from any retail version of Final Cut Express for $699. Educational and Not-for-Resale (NFR) versions do not qualify for upgrades.

Can I upgrade to Final Cut Studio if I have Final Cut Pro?
Yes. You can upgrade to Final Cut Studio from the retail version of Final Cut Pro for $699, or from the retail version of Production Suite for $499. Educational and Not-for-Resale (NFR) versions do not qualify for upgrades.

What version of Mac OS X do I need to use Final Cut Pro 5?
The minimum requirement for Final Cut Pro 5 is Mac OS X v10.3.9.

Do I need a Power Mac G5 to edit HD?
No. You can edit HD on any Power Mac G4 with a 1GHz or faster processor and at least 1 GB of RAM.

What video formats does Final Cut Pro 5 support?
Final Cut Pro 5 supports virtually any video format from DV and SD to film, DVCPRO HD, native HDV, and fully uncompressed 10-bit high definition (HD) video.

What audio formats does Final Cut Pro 5 support?
Final Cut Pro 5 can capture up to 24 simultaneous channels in AIFF and AAC formats.

Does Final Cut Pro 5 include an encoder?
Yes. Compressor 2 offers high-quality encoding for video and audio to supported formats for Final Cut Pro 5.

Will projects created in older versions of Final Cut Pro work in Final Cut Pro 5?
Yes. Existing projects created in iMovie, Final Cut Express, or any version of Final Cut Pro will work in Final Cut Pro 5.

Is my current video I/O compatible with Final Cut Pro 5?
Most I/O devices should work with Final Cut Pro 5.

Soundtrack Pro: Pasting audio into the right channel does not work

This article has been archived and is no longer updated by Apple.

Note: This issue is resolved in Soundtrack Pro 1.0.1 and later. Update to the latest version of Soundtrack Pro for best performance. Use Software Update or download updates here.

In some situations (in Soundtrack Pro 1.0), when you try to paste audio data from an audio file's left channel to another file's right channel in the Soundtrack Pro Waveform Editor, the data may end up in the left channel of the destination file.

This issue occurs when data is copied from an audio file that has a different sample rate than the audio file in which the data is pasted. You can resolve this issue by simply matching the sample rates of the two audio files before copying and pasting. Here are two ways to do that:

- Save the file that you're working on at the same sample rate as the file that you wish to copy data from. Then copy and paste between the two files.
- Save a copy of the file that you wish to copy data from at the same sample rate as the destination file. Open the copied file and select the section you wish to use, then copy it to the clipboard. You can now paste the copied data to either channel of your destination file.

Logic Pro/Express: Can‘t import MIDI file

This article has been archived and is no longer updated by Apple.

When you try to import a MIDI file, you may come across a situation in which the file cannot be imported into Logic Pro or Logic Express. When you try, nothing happens.

This occurs if the MIDI file is set to read-only permissions. If you change the file permissions to read-write, you should be able to import the file into Logic. To change the permissions:

1. Select the file in the Finder.
2. Control-click (or right click) the file.
3. In the shortcut menu, choose **Get Info**.
4. In the Info window, click the disclosure triangle for Ownership & Permissions.
5. From the **You can** pop-up menu, choose **Read & Write**.

Published Date: Feb 19, 2012

Logic Pro/Express 7: "What kind of file is this?" message when importing certain files

This article has been archived and is no longer updated by Apple.

When AIFF files are affected

When you try to import an AIFF file that contains compressed data (known as AIFF-C) into Logic Pro or Logic Express, you may find that you are unable to do this. Instead, you will see this message:

> "What kind of file is this?"

For AIFF files, this issue affects only Logic Pro and Logic Express 7.0 to 7.0.1. (See Getting the Logic 7.1 Upgrade).

When AAC and MP3 files are affected

This affects AAC and MP3 files only on Mac OS X 10.4 or later systems with Logic Pro or Express 7.1. The first time you try to import a file, the attempt may fail without any warning. On a subsequent attempt, you see the message "'xxx.aif - what kind of file is this?", where xxx is the name of the file.

When importing a compressed file, Logic starts by making an AIFF copy. The root issue is that these AIFF copies are sometimes left incomplete during the import attempt. On the second attempt, Logic attempts to reference the incomplete AIFF file rather than the original source file, which is why you see the message only on subsequent attempts.

To resolve this issue, update to Logic Pro or Express version 7.1.1 or later, available at Apple Downloads.

New SuperDrives support Double-Layer DVD burning

This article has been archived and is no longer updated by Apple.

The new SuperDrives built into the Power Mac G5 (Early 2005), iMac G5 (Ambient Light Sensor) computers, and eMac (Early 2005) computers now support DVD+R DL media, which means in addition to reading Double-Layer DVDs, they can write to a DVD+R DL disc. While single-layer recordable DVDs hold up to 4.7 GB of data, Double-Layer discs have two layers of data, allowing the SuperDrive laser to read and write on both layers, almost doubling the storage to 8.5 GB.

With iDVD (5.0.1 or later) or DVD Studio Pro, you can author discs with over three hours of MPEG-2 video on one DVD+R DL disc. The new SuperDrives can also read and write to DVD-R, DVD+R, DVD-RW, DVD+RW, CD-R, and CD-RW media.

To determine if your SuperDrive is capable of burning Double-Layer DVDs, do the following:

1. Open Apple System Profiler (from the **Apple** menu, choose **About This Mac** and then click the More Info button).
2. Select Disc Burning under Hardware.
3. Click on the Burning Device (SuperDrive) name.
4. In the DVD-Write section, if you see an item that displays "+R DL," your computer is capable of burning Double-Layer DVDs.

Mac OS X 10.4, 10.4.1: Print dialog slow to appear

This article has been archived and is no longer updated by Apple.

If the Print dialog takes a longer time than expected to appear in Mac OS X 10.4 or 10.4.1 after choosing **Print** from an application's **File** menu or pressing Command-P, update to Mac OS X 10.4.2 or later.

This issue can occur after upgrading to Mac OS X 10.4 Tiger.

If you're not ready to update to Mac OS X 10.4.2 or later, you can reset the printing system as a workaround.

Note: It's normal for the Print dialog to take a little longer to appear the first time you try to print after restarting the computer (even with Mac OS X 10.4.2 or later), but it should appear more quickly the next time you print. In this situation, do not reset the printing system.

Logic Pro: Ascending runs sound out of tune in Sculpture

This article has been archived and is no longer updated by Apple.

If you set the Keyboard Mode in Sculpture to "Legato," notes that are connected in an ascending run will stop rising in pitch after a certain point. If you play successively higher notes, the pitch will not rise and instead, the run will sound out of tune. This does not happen when you play descending runs.

Because of the way string modeling works in Sculpture, it's not always possible to play back rising pitches correctly in Legato mode. This relates directly to how you set the Resolution parameter in the String/Material section of the Sculpture interface.

To resolve this issue, lower the Resolution setting to increase the maximum range of pitch change so that notes will play correctly in Legato mode.

GarageBand 2: Input monitor level slider is dimmed

This article has been archived and is no longer updated by Apple.

When using GarageBand 2 on certain computers, you may come across a situation where you can't set the input monitoring level on a Real Instrument track. The slider will appear dimmed (unavailable) and set all the way to the left (minimum volume), like this:

Whether or not you can adjust the input monitor level depends on your computer or the audio hardware you're using. If you're using your computer's built-in audio input, the issue depends on which computer model you have. You can use Audio MIDI Setup (located in the Utilities folder), to find out if your computer supports the level adjustment.

1. Open Audio MIDI Setup.
2. Click the Audio Devices tab and look in the lower-left half of the window.
3. If the Audio Input section shows that you can adjust the individual input channels (sliders for channels 1 and 2 are available, as shown below), you should be able to adjust the level.

4. If the individual inputs cannot be adjusted (sliders 1 and 2 appear dimmed, as shown below), you won't be able to adjust the monitor input level in GarageBand.

Note: Remember that the input monitor level setting in GarageBand has nothing to do with the volume level that's written when recording—it only controls how loud the input sounds while you monitor it. Thus you can still record properly on systems that do not allow for input monitor level adjustment.

If you're using a third-party audio interface, in most cases the input monitor level can be adjusted, even if the built-in audio hardware on the computer does not offer this function.

Using Spotlight to search Final Cut Pro Help documents in Mac OS X 10.4 Tiger

This article has been archived and is no longer updated by Apple.

Mac OS X 10.4 features Spotlight, which you can use to quickly find information on your computer. Spotlight can find files as well as information in files. For example, if you want to find files on your computer that contain the words—HDTV, project, bid, and budget—Spotlight can quickly list all email messages, documents, and other files that are named with or contain those terms.

When you do a search using Spotlight, you're actually accessing a comprehensive, constantly updated index that sees all the metadata inside files—not only the "what, when, and who" information, but the content kind, author, edit history, format, size, and many other details.

However, there are some places that Spotlight won't search, such as certain "invisible" areas in the Mac OS X file system, and in user areas that do not belong to you (if your computer has multiple users). You can also set Spotlight to not search in certain areas for privacy—open System Preferences, click Spotlight, then click the Privacy tab to select your off-limits areas.

In the case of Final Cut Pro, Spotlight won't search its built-in Help PDF files because they're contained within the Final Cut Pro application itself. To get these documents into Spotlight's search scope, save the files outside of the application. Spotlight will then be able to index the documents. Afterwards, when you do a search and select one of these documents in the search results, Spotlight will open the PDF in Preview and highlight every instance of the search string you entered.

Here's how to save the Final Cut Pro Help files outside of the application for Spotlight searching (we're using Final Cut Pro 5 as an example, but the same general methods apply for Final Cut Pro 4 and Final Cut Pro 4.5 HD).

1. Open Final Cut Pro.
2. Choose **Help > Final Cut Pro User Manual**. The User Manual will open in Preview.
3. Choose **File > Save As**.
4. In the resulting dialog, save the file to the Desktop.
5. Close the file and switch back to Final Cut Pro.
6. Repeat the steps above for any other PDF documents that you want to make available for Spotlight searching. In Final Cut Pro 5, the other PDF documents are:
    - New Features
    - Getting Started
    - Quick Reference
    - HD and Broadcast Formats
7. Quit or hide Final Cut Pro, create a new folder on the Desktop (Control-click on the Desktop and choose **New Folder** from the shortcut menu), and name your folder (such as "FCP5Docs" or something similar).
8. Drag all the PDF files that you saved on the Desktop to the new folder.
9. Stash the folder away for safekeeping; the Documents folder inside your Home folder is a good location, but it's up to you. Spotlight will now be able to search these documents.

You can find more information on Spotlight here

Mac OS X 10.4: Downloaded Dashboard widgets don‘t automatically install

This article has been archived and is no longer updated by Apple.

Did you download widgets for Dashboard (part of Mac OS X 10.4 Tiger) but can't find them in Dashboard? If you use Safari to download Dashboard widgets but don't have the "Open 'safe' files after downloading" checkbox selected in Safari preferences (the option is disabled), the widgets will not be automatically installed into Dashboard.

So, how do you install a downloaded widget? It's easy.

1. In the Finder, choose **Home** from the **Go** menu.
2. Open the Library folder (the one in your Home folder).
3. If you don't see a Widgets folder, create a folder named Widgets.
4. Drag your downloaded widget files (they have a .wdgt extension) to the Widgets folder.

   Note: If your downloaded widget is still archived (the file name ends in .zip), be sure to double-click it first to reveal the actual .wdgt file.

The next time you open Dashboard, your new widget will appear in the widget bar (click the "+" button to reveal the bar), ready for you to add.

Note: In Mac OS X 10.4.1 or later, if the "Open 'safe' files after downloading" option is enabled in Safari preferences, Safari will alert you that a widget you're downloading will install automatically—in case you don't wish for that to happen.

Tip: In Mac OS X 10.4.2 or later, you can double-click a widget to install it. If your downloaded widget is still archived (the file name ends in .zip), be sure to double-click it first to reveal the actual .wdgt file, which you can then double-click to install (the rest of this document doesn't apply to 10.4.2).

Why not just double-click the downloaded widget in Mac OS X 10.4, 10.4.1?

In Mac OS X 10.4 and 10.4.1, double-clicking a downloaded widget (with .wdgt extension) does open it in Dashboard. However, this does not copy the widget to the ~/Library/Widgets folder. If you accidentally delete it from the download location (such as your desktop) and then log out or restart, it will no longer be available in Dashboard.

iWork: Do not rename applications or move them from the Applications folder when updating

This article has been archived and is no longer updated by Apple.

If you rename or move Pages or Keynote 2 (applications in iWork) from their default folder location (Applications/iWork), you will not be able to install updates for either application. For example, if you rename Pages or move it from the iWork folder and then try to install the Pages 1.0.1 update, you may get the following error message:

> Pages 1.0.1 cannot be installed on this computer. An eligible Pages application was not found in /Applications.

To prevent issues when installing iWork application updates, make sure that Pages and Keynote are in the iWork folder in the Applications folder and have not been renamed.

Locating and using loops in Soundtrack Pro

This article has been archived and is no longer updated by Apple.

Soundtrack Pro comes with a large collection of loops that you can use in your audio productions. You can also use other Apple Loops, such as those in Apple Jam Packs or from third-party vendors. If you want to use loops in your Soundtrack Pro projects, read on to learn where the loop content is installed, and how to access and use them in Soundtrack Pro.

Locating loops

When you install Soundtrack Pro, all the loop content gets installed here:

/Library/Audio/Apple Loops/Apple Loops for Soundtrack Pro

If you've installed GarageBand or Jam Pack loops click here for information about using them in Soundtrack. You can always move loops to another drive if you need additional space. After the move, you would need to re-index the loops in Soundtrack Pro using the Setup button in the Search tab.

If you want to use these loops in your Soundtrack Pro projects, you can access them from the Media and Effects Manager window in several ways.

By Browser
If you want to locate loops using a familiar Finder-like window, click the Browser tab in the Media and Effects Manager window.

You can use the Browser window to navigate to any loop that's accessible to your system on local or network volumes. Just double-click the icons that represent volumes or folders to navigate to your desired location. If you want to see the precise path to your currently displayed location, click the Path pop-up menu at the top of the window.

By Search
Click the Search tab and you'll be able to locate loops by tags, bits of categorical attributes that are saved as part of any Apple Loop. For example, you can search by instrument type, by tempo, by key, and other tags.

The Search window offers two basic views. Click the columns view button (the left button right below the Browser tab) to search loops by category, in the form of a list:

Click the button view button (the right button directly below the Browser tab) to search loops using a matrix of category buttons:

In either view, you can search for loops based on the categories you select in the window. You can further refine the search criteria by choosing attributes from the pop-up menus below the columns list or button matrix. You can choose to only see loops that use a particular time signature (the Time Signature pop-up menu), display only looping or non-looping files (the File Type pop-up menu), show files that are major, minor, good for both (the Scale Type pop-up menu), and more.

For example, say you're looking for looping beat files that are in 4/4 time and don't have a tone associated with them. Just select Beats as the instrument, choose 4/4 as the time signature, choose Looping as the file type, and choose Neither in the Scale Type pop-up menu (indicates that loops should be neither major nor minor), as shown here:

By Favorites
If you use certain loops frequently, you can define them as "favorites" by Control-clicking (or right-clicking, if you have a two-button mouse) a loop and choosing **Add to Favorites** from the shortcut menu that appears. To access your favorite loops, just click the Favorites tab to display them.

By Bin
If you want to see all the loops that you're currently using in your active project, click the Bin tab. The Bin window displays all loops that appear in the timeline. You can also add files to the Bin if you think you might want to use them in the current project.

Using loops

To preview a loop or audio file, select it in any of the windows mentioned above (Browser, Search, Favorites, or Bin), then click the speaker button at the bottom-left part of the window (in the Media & Effects Manager you just need to click the file). To use the file in a multitrack project, simply drag it into the desired track in the timeline. Soundtrack Pro also offers other editing options in a shortcut menu; just Control-click (or right-click) a loop in a window to display the shortcut menu.

For more information on using the Media and Effects Manager window, see the Soundtrack Pro User's Guide.

Before You Install DVD Studio Pro 4

This article has been archived and is no longer updated by Apple.

This document contains system requirements and things to do before you install the application and its accompanying utilities, Compressor and Apple Qmaster. For the latest information, see the Late-Breaking News file, available from each application's Help menu, and visit the DVD Studio Pro website.

Minimum Hardware Requirements

- A Macintosh computer with a 733 megahertz (MHz) or faster PowerPC G4 or G5 processor (G5 required for HD authoring and playback)
- 8 megabytes (MB) of video memory (32 MB recommended)
- 512 MB of RAM (1 GB required for HD)
- AGP Quartz Extreme graphics card
- For application installation: DVD drive, 10 gigabytes (GB) of disk space
- For writing finished projects to disc: Apple SuperDrive or other DVD recorder
- For writing finished projects to a double-layer disc: a double-layer compatible recorder and double-layer media
- For transporting projects on tape to a replicator (suggested for DVD-9 projects): DLT drive
- For transporting projects on disc that contain copy-protection or dual-layer features to a replicator: authoring DVD drive

Minimum Software Requirements

- Mac OS X v10.3.9 or later
- QuickTime 7.0 or later

Source Material Requirements

- Edited video files in MPEG-1, MPEG-2, HDV, HD DVD-compliant H.264, or QuickTime format
- Edited audio files in PCM, AIFF, MPEG-1 Layer 2, AC-3, DTS, or QuickTime format
- Video creation or editing software, such as Final Cut Pro and Motion, or any video and audio editing programs that support QuickTime

Before Installing the Software

Make sure you do the following before you install the software:

- Turn off any security software that you may have installed on your computer.
- Turn off any virus-protection software that you may have installed on your computer.
- Upgrade Mac OS X and QuickTime, if necessary.

Published Date: Oct 11, 2016

Before You Install Final Cut Pro 5

This article has been archived and is no longer updated by Apple.

This document contains system requirements and things to do before you install the application and its accompanying applications—Cinema Tools, Compressor, and LiveType. For the latest information, see the Late-Breaking News document, available in the Help menu for each application.

WARNING: The Final Cut Pro 5 Installer checks system requirements before installing. If your system does not meet the minimum requirements listed below, Final Cut Pro will not be installed.

Minimum Hardware Requirements

- A Macintosh computer with a 500 megahertz (MHz) or faster PowerPC G4 or G5 processor (550 MHz for PowerBook G4) or any dual PowerPC G4 or G5 processors
- AGP (Accelerated Graphics Port) Quartz Extreme graphics card
- 512 megabytes (MB) of random-access memory (RAM); 1 gigabyte (GB) recommended
- For HD: A Macintosh computer with a 1 gigahertz (GHz) or faster PowerPC G4 or G5 processor and 1 GB of RAM; 2 GB recommended

Minimum Software Requirements

- Mac OS X v10.3.9 or later
- QuickTime 7.0 or later

Available Hard Disk Drive Space

Final Cut Pro and its associated applications require a certain amount of free disk space:

- For application installation: 1 GB available disk space required
- For optional installation of all LiveType content: 12 GB available disk space required

Note: The progress bar that appears when you are installing LiveType content may not indicate the correct time and disk space required for installation.

Before You Install

Make sure you do the following before you install the software:

- Turn off any virus protection and security software that you may have installed on your computer.
- Upgrade to Mac OS X v10.3.9 or later and QuickTime 7.0 or later.

GarageBand: Distortion when recording with M-Audio MobilePre USB

This article has been archived and is no longer updated by Apple.

If you're using an M-Audio MobilePre USB audio interface to record audio in GarageBand, your recordings may sound clipped and distorted—even if the incoming level is set appropriately.

This issue occurs if you're using the MobilePre USB driver version 1.5.7fl or earlier, and set the latency to Low in its preferences. You can resolve the issue by installing the 1.6 or higher version of the driver from the M-Audio website.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

GarageBand: Audio distortion and dropouts when playing Software Instruments

This article has been archived and is no longer updated by Apple.

If the CPU load on your computer is too high, you may hear some audio dropouts or distortion in GarageBand when you play a Software Instrument track live.

If this happens to you, try quitting other applications when using GarageBand. If you're using GarageBand 2, try locking tracks to free up some CPU processing time.

Published Date: Feb 18, 2012

GarageBand: Audio monitoring stops working after about 90 seconds

This article has been archived and is no longer updated by Apple.

When you're monitoring the audio of a Real Instrument track, the audio input monitoring may stop working after about 90 seconds into your recording session. You may hear clicks and pops in the monitored signal before it drops out.

This issue affects GarageBand versions earlier than 3.0 (which is a part of iLife '06) when using different audio interfaces for the input and the output. For example, if you use an external USB or FireWire audio interface for input and your computer's built-in audio for output, this can happen to you.

To avoid this issue, use the same audio device for both input and output when using an affected GarageBand version.

Mac OS X Server 10.4: SSL-enabled services may not work properly on an upgraded server

This article has been archived and is no longer updated by Apple.

SSL-enabled services such as iChat and Mail may not work properly on a Mac OS X 10.4 (build 8A428) server that was upgraded from Mac OS X Server 10.3. This happens because the "certusers" group is not created during the upgrade.

For example, when you attempt to start the iChat service, you may see lines like the following ones appear in the system log (`/var/log/system.log`):

```
May 5 19:28:37 xserve iChatServer-jabberd[1041]: 20050506T00:28:37: [error] (-configure): SSL
Connections are disabled. [error: 0200100D:system library:fopen:Permission denied] while using SSL
certificate file '/etc/certificates/Default.crtkey' for host '0.0.0.0'.
May 5 19:28:37 xserve iChatServer-jabberd[1041]: 20050506T00:28:37: [notice] (-internal):
initializing server
May 5 19:28:37 xserve iChatServer-jabberd[1041]: 20050506T00:28:37: [notice] (-internal): server
started
May 5 19:28:59 xserve iChatServer-jabberd[1041]: 20050506T00:28:59: [notice] (-internal): shutting
down server
May 5 19:30:02 xserve iChatServer-jabberd[1051]: 20050506T00:30:02: [error] (-configure): SSL
Connections are disabled. [error: 0200100D:system library:fopen:Permission denied] while using SSL
certificate file '/etc/certificates/Default.crtkey' for host '0.0.0.0'.
May 5 19:30:02 xserve iChatServer-jabberd[1051]: 20050506T00:30:02: [notice] (-internal):
initializing server
May 5 19:30:02 xserve iChatServer-jabberd[1051]: 20050506T00:30:02: [notice] (-internal): server
started
May 5 19:30:41 xserve iChatServer-jabberd[1051]: 20050506T00:30:41: [notice] (-internal): shutting
down server
```

To resolve this issue, do the following:

1. Be sure you are logged in as an administrator.
2. Open Terminal (/Applications/Utilities/).
3. Execute this command:

   ```
   echo 'certusers:*:29:root,jabber,postfix,cyrusimap' | sudo niload group .
   ```

   Note: For convenience, you can copy and paste this into the Terminal window. If you do, be sure to copy/paste the final period.
4. Enter your admin user password if prompted.
5. Restart the server.

This document will be updated as more information becomes available.

About WorldBook Encyclopedia and Mac OS X 10.4 Tiger

This article has been archived and is no longer updated by Apple.

Want to use WorldBook Encyclopedia 2004 or 2003 with Mac OS X 10.4 Tiger? You will need to download a WorldBook update from MacKiev first.

If you have a later version of WorldBook Encyclopedia, such as 2005, it should work just fine with Mac OS X 10.4 Tiger.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Logic Pro: Some SMPTE events won‘t unlock

This article has been archived and is no longer updated by Apple.

In Logic Pro, after you lock a region (or events within it) to SMPTE time, you can't subsequently unlock all of the SMPTE events. Some will unlock, but others won't.

If this happens, undo your actions back to the last point before locking SMPTE to the region or events.

This issue is resolved in Logic Pro version 7.1.1 or later, available at Apple Downloads.

Published Date: Feb 19, 2012

Mac OS X 10.4: Mail unexpectedly quits, stops responding, or won‘t import previous mailboxes

This article has been archived and is no longer updated by Apple.

If you use third-party plug-ins with Mail in Mac OS X 10.4 Tiger, be aware that they can lead to issues, such as Mail unexpectedly quitting or not being able to import previous mailboxes. This can happen even if the plug-ins worked with Mail in earlier versions of Mac OS X.

Note: Apple does not support the use of third-party plug-ins with any version of Mail or Mac OS X. This article is provided as courtesy information—not as a statement of compatibility.

If you are experiencing issues with Mail due to third-party plug-ins, you can download and install the Mac OS X 10.4.1 Update or later. Your third-party plug-ins will be disabled so that Mail can function properly.

If you're not ready to update, follow these steps to remove the plug-ins:

1. Quit or Force Quit Mail.
2. Remove all plug-ins from the ~/Library/Mail/Bundles and /Library/Mail/Bundles folders.
3. Open Mail. If your previous mailboxes and folders do not appear, choose **Import Mailboxes** from the **File** menu.

Mac OS X 10.4: Classic does not progress beyond the welcome screen

This article has been archived and is no longer updated by Apple.

When opening Classic in Mac OS X 10.4 Tiger, if the "Welcome to Mac OS 9" screen appears but Classic never finishes loading (the extension icons don't appear), use the troubleshooting tips below.

Note: If the issue occurred before Tiger was installed, or this involves a different Classic startup issue, see this article instead.

Make sure the installed version of Mac OS 9 is 9.2.2

If Mac OS 9.2.2 is not installed (for example, if 9.0 or 9.1 are installed), update to Mac OS 9.2.2. You can find out which version of Mac OS 9 is in the System Folder in one of these ways:

- Open Startup Disk preferences and look at the Mac OS 9 System Folder version (the Mac OS 9 System Folder only appears in Startup Disk preferences if your computer can start from Mac OS 9)
- Open the System Folder and Get Info on the "System" file. It should be version 9.2.2. Note that the System Folder differs from the System folder of Mac OS X (visit Classic preferences to see where your Mac OS 9 System Folder is, if you don't know).

If these show that an earlier version of Mac OS 9 is installed, update to Mac OS 9.2.2.

Check for a DivX plug-in

If Mac OS 9.2.2 is installed but the issue still occurs, look for a DivX plug-in located in /Library/QuickTime. If it's there, remove the "DivXNetworks" folder from /Library/Application Support.

iSync 2: Repeating events dated 1979 and earlier may not sync

This article has been archived and is no longer updated by Apple.

If you have repeating iCal events that are dated prior to January 1, 1980 (1980-01-01), the events may not sync with some Symbian OS-based phones when using iSync 2.0 or later. In addition, if you are using iSync version 2.0, these events may cause the iSync Agent application on your phone to unexpectedly quit.

Such events may include birthdays that you created in Address Book that got added to iCal. For example, if you create a repeating iCal event that's dated "May 5, 1975" and titled "Day 1: I am born," the event may not show up on your phone after the sync is complete, or iSync Agent may unexpectedly quit when you try to sync that event to your phone.

To prevent iSync Agent from unexpectedly quitting, update iSync 2.0 to version 2.1 or later (use Software Update or download the update from Apple Downloads).

To ensure that your events get synced to your phone, make sure that all *repeating* events you want to synchronize are dated January 1, 1980 or later.

Symbian OS-based phones

Symbian OS-based phones include the Sony Ericsson P800 and P900, Nokia 3600, Nokia 3620, Nokia 3650, Nokia 3660, Nokia 6600, Nokia 7650, and Nokia N-Gage.

If you're not sure what type of OS your phone uses, check the documentation that came with it.

Tip: If iSync asked you to install the iSync Agent application on your phone when you added it to iSync the first time, your phone is Symbian OS-based.

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Final Cut Studio: Installer does not properly check for adequate disk space to install

This article has been archived and is no longer updated by Apple.

When you install Final Cut Studio from the DVD, the Installer does not properly check the amount of free disk space available on your computer before performing the installation. You will need 4 GB of disk space available to install all the applications; you will need an additional 41 GB to install all optional templates, loops, content, and tutorials (these may be installed on separate disks).

If your computer does not have enough available disk space, the Install button in the Installer will still be accessible (it won't dim), allowing you to start the installation. If you do so, you'll get the following error during the installation process:

> "Your startup disk is almost full"

A few minutes later, a second dialog will appear:

> "There were errors installing the software. Please try again."

If you see these errors, you can free up some disk space by throwing away files and applications that you no longer need, and backing up files that you wish to keep to other volumes or media. You can also custom install only specific parts of Final Cut Studio and you can change the location for certain items. See the Installing Your Software guide for additional information.

Mac OS X Server: Understanding the "disconnect when idle" feature for AFP connections

This article has been archived and is no longer updated by Apple.

When you select the idle disconnect feature for Apple File Service (AFP) clients of Mac OS X Server 10.3 or 10.4, Server Admin may still list clients' connections even after they have gone idle. And idle client's listing will be dimmed, indicating that it's no longer an active connection.

The reason that Server Admin still lists the idle clients is because Mac OS X Server saves AFP sessions for later reconnect (known as "session caching"), allowing clients to resume AFP activity after sleep, for example. You can verify that the session was saved by these signs:

- The client's name is dimmed with a status of "Sleep / Idle" in Server Admin (Mac OS X Server 10.3.x only).
- The AFP log contains an entry like:

```
IP 17.22.99.79 - - [24/Feb/2005:13:55:04 -0800] Idle Disconnect: User1 0 0 0 IP 17.22.99.79 - -
[24/Feb/2005:13:55:04 -0800] Saved for Reconnect User: User1 1109281845 10 0
```

This is normal, and no further action is required. If you would like to disable AFP session caching, follow these steps:

1. For Mac OS X Server 10.4, Log in as root at the server and issue these three Terminal commands:

   ```
   cp /Library/Preferences/com.apple.AppleFileServer.plist /Library/Preferences/com.apple.AppleFileServer.plist.old
   plutil  -convert xml1  /Library/Preferences/com.apple.AppleFileServer.plist
   pico /Library/Preferences/com.apple.AppleFileServer.plist
   ```

   For Mac OS X Server 10.3, Log in as root at the server and issue these two Terminal commands:

   ```
   cp /Library/Preferences/AppleFileServer.plist /Library/Preferences/AppleFileServer.plist.old
   pico /Library/Preferences/AppleFileServer.plist
   ```

2. In the pico text editor, locate the lines that contain:

   ```
   <key>reconnectFlag</key>
   <string>no_admin_kills</string>
   ```

3. Replace the string `no_admin_kills` with `none`, so that the line now reads:

   ```
   <string>none</string>
   ```

4. Save the file (Control-O), press Return, and exit pico (Control-X).
5. Restart the AFP service in Server Admin.

About Apple Intermediate Codec 1.0.1

This article has been archived and is no longer updated by Apple.

Apple Intermediate Codec 1.0.1 delivers improved compatibility and reliability for Final Cut Express HD and iLife '05 users. This update is recommended for all users who are currently using Apple Intermediate Codec 1.0 and QuickTime 7.

Key updates include:

- Improved export performance
- Improved playback

You can download the Apple Intermediate Codec 1.0.1 from here.

Published Date: Oct 7, 2016

iTunes 4.8: Security enhancements

This article has been archived and is no longer updated by Apple.

This document describes security enhancements included with iTunes 4.8, which can be downloaded and installed using Software Update, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred, and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How To Use The Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

iTunes 4.8

Available for: Mac OS X v10.2.8 or later, Microsoft Windows XP, Microsoft Windows 2000
CVE-ID: CAN-2005-1248
Impact: A buffer overflow in iTunes could cause a denial of service and lead to the execution of arbitrary code.
Description: The MPEG4 file parsing code in iTunes versions prior to 4.8 contains a buffer overflow vulnerability. Parsing a maliciously-crafted MPEG4 file could cause iTunes to terminate or potentially execute arbitrary code. iTunes 4.8 addresses this issue by improving the validation checks used when loading MPEG4 files. iTunes 4.8 is available here. Credit to Mark Litchfield of NGS Software for reporting this issue.

Motion 2: Error when exporting tutorial project to Compressor

This article has been archived and is no longer updated by Apple.

If you have one of the Motion tutorial projects open and then try to export it using Compressor, you may get an alert message that states that an error occurred while exporting to Compressor. This happens because the folder in which the tutorial projects are installed is a "read-only" folder.

When you export projects using Compressor 2, the application automatically creates a "Motion Batch Export Files" folder in the same location as the source file (in this case, it's trying to create the folder in the read-only tutorial projects folder, but won't succeed).

To resolve this issue, make sure that your project is in a location that you have both read and write access to allow Compressor to create the export folder. To export a Motion tutorial, save a copy of the tutorial project to another location (for example, your Documents folder) by choosing **File > Save As** in Motion.

Mac OS X Server 10.4: Inherit permissions does not work for AFP service

This article has been archived and is no longer updated by Apple.

When offering Apple File Protocol (AFP) service, Workgroup Manager allows you to set the default permission on new files and folders to "Inherit permissions from parent." This option does not work presently with Mac OS X Server 10.4 to 10.4.1. Specifically, AFP server is not setting the permissions on files created in subfolders of a shared folder when inherit permsissions is enabled.

Mac OS X Server 10.4.2 Update resolves this issue.

Note: If you enable or disable ACLs for a volume, you'll need to unmount and remount the volume for your selection to take effect. Alternatively, you could restart your server.

Motion 2.0: Mac OS X 10.4.1 Update resolves issues, improves ATI graphics card compatibility

This article has been archived and is no longer updated by Apple.

If you use Motion 2.0 with Mac OS X 10.4 Tiger, you should update to Mac OS X 10.4.1 or later.

The Mac OS X 10.4.1 Update offers reliability improvements for float rendering in Motion 2 when used with an ATI graphics card. The update also addresses issues encountered when using some of the Core Image Unit filters provided with Tiger. Additionally, the update resolves an issue in which Motion could unexpectedly quit when using LiveFonts.

Motion: Zoom keyboard shortcut changed with Mac OS X 10.4

This article has been archived and is no longer updated by Apple.

If you used Motion with Mac OS X 10.3, you may have become accustomed to temporarily invoking the Zoom tool by pressing Command-Space bar, and dragging right or left to zoom in or out from a point on the canvas.

If you are using Motion in Mac OS X 10.4 Tiger, pressing Command-Space bar will invoke the new Spotlight feature. To temporarily invoke the Zoom tool, press the Space bar first, then press the Command key.

Published Date: Feb 18, 2012

QuickTime Player unexpectedly quits when saving Motion project

This article has been archived and is no longer updated by Apple.

You can open a Motion project file in QuickTime Player by pressing Option-Command and dragging the Motion file to the QuickTime Player icon in the Dock or in the Applications folder.[1]

While you can play the project in QuickTime Player, if you choose **Save as** from the **File** menu to create a new QuickTime movie file, QuickTime Player may unexpectedly quit. If you are successful with saving the file, the resulting QuickTime movie file may also cause other applications to unexpectedly quit when you attempt to open it or import it.

To avoid this, do not save Motion projects opened in QuickTime Player. If you wish to save a Motion project as a QuickTime Movie, open the project in Motion and choose either **File > Export** or **File > Export using Compressor**.

Notes

1. In some configurations Motion project files cannot be opened in QuickTime. Click here for more information.

Xsan: Editing mount options to increase performance

This article has been archived and is no longer updated by Apple.

Editing plist files used by Xsan to customize mount options may help increase performance in some scenarios if you are using Mac OS X Server 10.3.5 or later, and Xsan 1.1 or later. To do this, follow these steps.

1. Using Xsan Admin, unmount the volume on the client (doing so will ensure that the client's automount plist file is in the new format).
2. At the client, use Terminal to copy the automount.plist file to a working directory, such as your desktop:

   ```
   % cp /Library/Filesystems/Xsan/config/automount.plist ~/Desktop/
   ```

3. If you haven't already installed the Xcode Tools package from your Software Installation disc, do so now (the next steps require using the Property List Editor utility that Xcode installs at /Developer/Applications/Utilities).
4. Open the automount.plist file in Property List Editor.
5. Expand the plist as shown.

6. Select the MountOptions node, then click the New Child button.
7. A new item appears. Replace the text "New item" with "dircachesize." Make sure that the Class column shows "String." In the Value column, type "256m." This will set the directory cache size on the client to 256 MB (depending on the amount of memory installed in the client and the expected workload, a different value may be appropriate).

8. Repeat steps 5 to 7 for each volume that you want to change.
9. From the **File** menu, choose **Save**.
10. Quit Property List Editor.
11. In Terminal, copy the updated automount.plist file back to the Xsan configuration directory on the client:

    ```
    % sudo cp ~/Desktop/automount.plist /Library/Filesystems/Xsan/config/
    ```

12. Mount the volume on the client using Xsan Admin.

The volume should now mount with the new mount options specified in automount.plist.

iWork: Installing iWork over a trial version

This article has been archived and is no longer updated by Apple.

Retail purchases of Mac OS X 10.4 and new computers that come with Mac OS X 10.4 both include a trial version of iWork. Because of this, installing a full retail copy of iWork is easier than you think.

After purchasing iWork, rather than install the software from the iWork disc, simply open the trial version on your computer. When prompted to buy or try, click the Buy button and enter the serial number that came with your retail copy of iWork. This will unlock the full version—you will no longer be prompted to purchase the software.

Motion 2: Important installation considerations

This article has been archived and is no longer updated by Apple.

If you are planning to install Motion 2, here are some important things to consider before installing.

- Motion 2 cannot be installed on the same partition as Motion 1.0 or 1.0.1. If you want to continue using Motion 1.x, you should install Motion 2 on a different partition.
- You will need Mac OS X 10.4 Tiger if you want to use the new 16-bit or 32-bit float rendering in Motion 2 (you should also have a 256 MB graphics card installed).
- When you're installing Motion, if you choose an alternate install location for your Motion Content and then run the HD templates installer, the HD templates may not get installed in your alternate location. This can happen if there is a space in the alternate install path (for example, ~/Documents/my content), or if the path contains the name Motion (for example, ~/Documents/motion). In the latter scenario, the HD Templates will get installed in the default location (/Users/Shared/Motion/Templates). You can move the templates to your preferred location, but you must move or copy all of the following files:
  - Motion/Library/Content/Tech Blue
  - Motion/Library/Content/Blocks
  - Motion/Templates/Tech Blue
  - Motion/Templates/Blocks

  The Motion HD Templates.pkg installer is located in the Motion Extras folder on the Motion 2 install disc.

Logic Pro/Express: Cycle recording audio with autodrop does not work

This article has been archived and is no longer updated by Apple.

When you set an autodrop zone inside a cycle zone in Logic Pro or Logic Express, you won't be able to record multiple passes of audio. Recording stops after the first pass through the cycle completes. You can record multiple passes of audio in cycle mode as long as you don't enable autodrop.

If you're recording MIDI, you can set an autodrop zone inside a cycle zone when recording and the function will work as expected.

This document will be updated as more information becomes available.

Motion 2: More memory recommended for HDV

This article has been archived and is no longer updated by Apple.

HDV source material requires more memory for good playback performance. If you are using HDV source material in your Motion project, playback may be considerably slower than when using DV source material. Adding additional memory will improve realtime playback with HDV files in Motion.

While the minimum memory requirements are 512MB of RAM, 2GB or more is recommended.

Published Date: Oct 11, 2016

Motion 2: Back face of object may appear cropped when using the Basic 3D filter

This article has been archived and is no longer updated by Apple.

In Motion 2, the Basic 3D filter allows you to rotate an object on the X, Y, and Z axes. You can also place another image on the back face of the object to which the filter is applied.

However, if the image you use for the back face is larger than the original, when you rotate the object using the Basic 3D filter, the back face image will be cropped to the size of the original object. The Basic 3D filter will not expand the original object's size based on the size of the image you assigned to its back face image well.

To prevent this from happening, use an image that's the same size or smaller than the original for the back face, or scale up the original object before applying the filter.

This document will be updated as more information becomes available.

Motion: Can‘t use "gestures in the air" function with a Wacom tablet in Tiger

This article has been archived and is no longer updated by Apple.

If you use a Wacom tablet and pen with Motion, you can use *gestures*—continuous, uninterrupted patterns drawn in the Motion user interface, using your tablet—to navigate and perform tasks such as editing, copying, and pasting.

In the Gestures pane of Motion preferences, you can select the "Allow gestures in the air" checkbox to trigger gestures without touching your pen tip to the tablet. However, in Mac OS X 10.4 Tiger, selecting this checkbox won't allow you to make gestures with your pen in the air. This affects Motion 1 and Motion 2 in Tiger. Instead, you will be limited to making gestures on the surface of your tablet.

This document will be updated as more information becomes available.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Final Cut Pro HD: Motion relinking

This article has been archived and is no longer updated by Apple.

Final Cut Pro HD 4.5 may not recognize Motion (.motn) files when you open a Final Cut Pro project on a different computer than the one used to create it. This issue occurs if you used Media Manager in Final Cut Pro to collect a project containing Motion files, and moved the project to another computer. This can happen with files created in Motion 1 or Motion 2.

To resolve this issue, you will need to relink the Motion files on the second computer before opening the Final Cut Pro project. To do this:

1. Open the Motion project file in Motion and relink the media by clicking Reconnect and locating the files.
2. Save the Motion project.
3. Open the Final Cut Pro project and relink the media files.

This document will be updated as more information becomes available.

Published Date: Feb 20, 2012

Motion 1: QuickTime Player in Mac OS X 10.4 won‘t open projects

This article has been archived and is no longer updated by Apple.

You can open and play Motion project files in QuickTime Player by selecting the project, pressing Option-Command, and dragging the Motion file to the QuickTime Player icon in the Dock or Applications folder. Or in QuickTime Player, you can choose **File > Open**, navigate to a Motion project in the resulting dialog, and click Open.

However, if you are using Motion 1 in Mac OS X 10.4 Tiger, you won't be able to do this. If you want to play your Motion 1 projects in QuickTime Player, you can save the project as a QuickTime movie; just open the project in Motion and choose **File > Export**, or **File > Export using Compressor**.

This document will be updated as more information becomes available.

Published Date: Oct 7, 2016

Mac OS X 10.4: Printing multipage TIFF documents

This article has been archived and is no longer updated by Apple.

In Mac OS X 10.4 Tiger, you can use Preview to print documents. However, Preview will only print the first page of a multipage TIFF document in Mac OS X 10.4 through 10.4.2.

To resolve the issue, download and install the Mac OS X 10.4.3 Update, or later.

If you're not ready to update to Mac OS X 10.4.3 or later, here's a tip: If the affected TIFF file was created by an application that can save in different file formats, configure the application to save files in another format. For example, third-party fax software may save incoming multiple-page faxes as TIFF documents. If the software allows you to save incoming faxes in a different format, such as PDF, change the setting.

Mac OS X 10.4: Editing Address Book card fields

This article has been archived and is no longer updated by Apple.

In Mac OS X 10.4 Tiger, you can edit Address Book contact cards in a variety of ways, such as by clicking the Edit button or by choosing **Edit Card** from the Address Book **Edit** menu.

About double-click editing

With Mac OS X 10.4 Tiger, you may have become accustomed to editing information in a card by double-clicking on a field. With Mac OS X 10.4.1 or later, you can still do this, but you'll need to hold down the Option key when you double-click.

About the security content of the Mac OS X 10.4.1 Update

This article has been archived and is no longer updated by Apple.

This document describes the security content of the Mac OS X 10.4.1 Update, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How To Use The Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Mac OS X 10.4.1 Update

- **Bluetooth**

  Available for: Mac OS X v10.4, Mac OS X Server v10.4

  CVE-ID: CAN-2005-1333

  Impact: Directory traversal via Bluetooth file and object exchange

  Description: Due to insufficient input checking, the Bluetooth file and object exchange services could be used to access files outside of the default file exchange directory. This update addresses the issue by adding enhanced filtering for path-delimiting characters. Credit to kf_lists[at]digitalmunition[dot]com for reporting this issue.

- **Dashboard**

  CVE-ID: CAN-2005-1474

  Available for: Mac OS X v10.4, Mac OS X Server v10.4

  Impact: Malicious websites can download and install widgets via Safari without the Safe Download Validation warning

  Description: This update blocks the automatic installation of Dashboard widgets. Mac OS X's Safe Download Validation warning is enabled, requiring user approval before a Dashboard widget is installed by Safari. This issue does not affect Mac OS X versions prior to 10.4. Further information on removing Dashboard widgets that you have installed is available here.

- **Kernel**

  CVE-ID: CAN-2005-1472

  Available for:Mac OS X v10.4, Mac OS X Server v10.4

  Impact:Users can discover the names of files placed in normally unsearchable places

  Description:Two system calls designed to allow efficient searching of filesystem objects incorrectly checked the permissions on enclosing directories and would reveal the names of files. The incorrect checking only occurred for directories without the POSIX read, but with the POSIX execute bits set for group and other. In practice this issue only affects files stored in users ~/Public/Drop Box. This update addresses the issue by correctly honoring the POSIX permission bits on directories. Credit to John M. Glenn of San Francisco for reporting this issue.

- **Kernel**

  Available for: Mac OS X v10.4, Mac OS X Server v10.4

  CVE ID: CAN-2005-0974 CERT: VU#713614

  Impact: Local system users can cause a local denial of service

  Description: A vulnerability in the nfs_mount() call due to insufficient checks on input values could allow unprivileged local users to create a denial of service via a kernel panic.

- **SecurityAgent**

TA23244_About_the_security_content_of_the_Mac_OS_X_Update.pdf

CVE-ID: CAN-2005-1473

Available for: Mac OS X v10.4, Mac OS X Server v10.4

Impact: Users with physical access to a system with a locked screensaver can start background applications

Description: A contextual menu feature in Mac OS X 10.4 allows URLs to be opened from a text input field. This could be used to launch an application behind a locked screensaver window. This update addresses the issue by removing the contextual menu from screensaver text input fields.

Published Date: Oct 7, 2016

Soundtrack Pro: How to use the Match EQ plug-in

This article has been archived and is no longer updated by Apple.

One of the most powerful sound-shaping tools in Soundtrack Pro is Match EQ. This plug-in can be used to analyze an audio file, compare the tonal data with another audio file, and then generate a frequency spectrum so that the second file matches the frequency characteristics of the first. This is an ideal tool to make dialog tracks from different location or ADR sessions sonically match one another.

Match EQ uses a virtually unlimited number of filters (it uses as many as it needs in any particular instance) to accurately generate a tonal spectrum to achieve a match.

The Match EQ interface

The Match EQ GUI (graphical user interface) offers a detailed frequency spectrum display where you can monitor the spectral content of the audio being analyzed and processed.

The buttons below the spectrum display let you control the audio analysis and spectrum application. The Learn button under Template allows you to analyze an audio file (or clip) that you want other files to match. The Learn button under Current Material allows you to analyze a second audio file—one that you want to modify to match the first. The Match button under Current Material will compare both learned frequency spectra, generate an EQ curve, and apply it to the second audio file so that it matches the first.

Here's a look at two basic workflows where you might want to use Match EQ.

Using Match EQ in a Multitrack Project

Let's say that you're working on a simple voice-over project, as shown in the image below:

You have three dialog clips that feature the same voice talent. However, let's say that the middle clip shown is a retake that you recorded at a later time. Maybe this clip was recorded in a different room, or with a different microphone, or perhaps the narrator simply sounded different that day. For whatever reason, the middle clip sounds noticeably different than the first and third clips. Match EQ can correct this quite easily. Here's how.

1. Insert Match EQ in the track; in the Media and Effects window, click the Effects tab.

2. In the Category pane, select Soundtrack Pro and in the Effect pane, select Match EQ. (**Tip**: Instead of scrolling down the Effect list, just click on any listed effect and press the *M* key; Match EQ will immediately be highlighted.)
3. Click the plus sign (+) button to insert the plug-in on the track.
4. Click the Advanced button to open the Match EQ interface.
5. To make the middle (second) clip sound like the others, you want Match EQ to learn the frequency spectrum of the original recording session (the first or third clip) and apply that spectrum to the middle clip to make it match. Set the playhead to just before the first clip.
6. Play a bit of the clip to listen. Click the Learn button under Template to start analyzing it and then stop playback. The button and the dB (decibel) scale indicators on each side of the spectrum display turn red. The spectrum display shows the frequency content of the clip.

7. Click the Learn button again to stop analyzing.
8. To analyze the middle clip, set the playhead to just before the second clip in the track. Play a few seconds, then click the Learn button under Current Material to start analyzing it. The button and the dB scale indicators turn green. The spectrum display shows its frequency content.

9. Match EQ now "knows" the frequency spectra of both recording sessions. To have it create an EQ curve that will correct the middle clip to match the others, click the Match button. The button and the dB scale indicators turn gold. The spectrum display shows a graphic representation of the EQ curve being applied.

10. During playback, apply the EQ curve to the middle clip only—you'll need to bypass the curve while the first and third clips are playing by automating the "match" parameter. To do this, go to the Timeline in the Project window and choose **Latch** from the automation mode pop-up menu. This allows Soundtrack Pro to write automation during playback.

11. In the Media and Effects window, click the Match EQ disclosure triangle to display the controls for its parameters.

12. Note the Auto column, which contains checkboxes, on the right side of the window. These checkboxes allow you to enable automation for their respective parameters. Select the Auto checkbox next to Match to enable it.
13. Set the Match parameter to "Off" for now (click the Off radio button), since we don't want to apply the Match curve to the first clip.
14. Start playback and when the playhead reaches the gap between the first and second clip, click the Match parameter's On radio button in the Media and Effects window.
15. When the second clip finishes playing, click the Match parameter's Off radio button again.
16. Stop playback, then rewind.
17. Choose **Play** from the automation pop-up menu and then play back the track. The EQ should engage just before the second clip starts to play and then disengage just after it's finished.
18. If you click the Dialog Track's disclosure triangle, you can view the details for the track, which will look something like this:

Using Match EQ in an Audio File Project

In some workflows, you may prefer to apply Match EQ directly to an audio file, rather than automating it within a track. To do this:

1. Open the clip that you wish to process as an Audio File Project by double-clicking the file.
2. A dialog appears, asking whether you wish to edit the file destructively or non-destructively. Select the option you prefer, then click OK to open the Audio Wave Editor.
3. Create an action layer using Match EQ by choosing **Process > Effects > EQ and Filter > Match EQ**.
4. The Match EQ interface appears. In this example workflow, we want to "teach" Match EQ the frequency spectrum from another audio file by loading it. Control-click (or right-click) the Learn button under Template.
5. From the shortcut menu, choose **Generate Template Spectrum from Audio File**.
6. In the resulting dialog, navigate to and select the audio file to which you'd like to match the current file.
7. Match EQ analyzes the selected file.
8. To analyze your current audio file, click the Learn button under Current Material, then click the Play button at the bottom of the interface.

9. After a few seconds, stop playback to stop the analysis.
10. Click the Match button to have Match EQ generate an EQ curve that will match your current audio to your audio template.
11. Click the Apply button to create an action layer that comprises the Match EQ effect.

For a detailed description of Match EQ and most of the other effects included with Soundtrack Pro, see the Logic Pro Plug-in Reference PDF file.

Mac OS X 10.4: Address Book unexpectedly quits when printing on an envelope

This article has been archived and is no longer updated by Apple.

When you use Address Book in Mac OS X 10.4 to print an envelope (by choosing **Envelopes** from the **Style** pop-up menu in the Print dialog), you may come across a situation where nothing happens after you click the Print button. If you try printing a second time, Address Book unexpectedly quits.

This happens if your own Address Book card doesn't include a postal address (Address Book prints this information as a return address on the envelope). To add a postal address to your card:

1. Open Address Book.
2. From the **Card** menu, choose **Go to My Card**.

   Note: Go to My Card works only if you have a card for yourself. If you have not: Choose New Card from the File menu, enter your name in the First and Last fields, then choose Make This My Card from the Card menu.

3. Click the Edit button at the bottom of the window.
4. Enter a postal address in the fields next to an address label.
5. From the **File** menu, choose **Save** (or press Command-S).

You should now be able to print out an envelope. If you prefer not to have your address printed as the return address on the envelope, do this:

1. In Address Book, choose **Print** from the **File** menu.
2. In the Print dialog, choose **Envelopes** from the **Style** pop-up menu.
3. Click the Label tab.
4. Deselect the "Print my address" checkbox.
5. Click Print.

This document will be updated as more information becomes available.

iDVD: Modified asset warning

This article has been archived and is no longer updated by Apple.

If you archive an iDVD project and then open it on a different computer, you may get a "Modified Asset Warning" message.

If this happens, just click the Update button, and your project should open with all of its elements intact.

Xsan: Not supported for mail services database storage

This article has been archived and is no longer updated by Apple.

If you are running mail services on Mac OS X Server 10.3 or 10.4, you can specify an external or alternate volume to store the mail services database. However, using an Xsan volume as storage for Apple mail services is not supported.

If you want to use an Xserve RAID as storage for Apple mail services, Apple recommends directly connecting the RAID to the mail server.

iDVD: Wrong music after switching users

This article has been archived and is no longer updated by Apple.

After switching to a new user and creating a new iDVD 5 project, the background music in the project may not get updated. Instead, you can end up with the music from the previous user's project—even if you choose new audio for the new project.

You can avoid this by doing the following steps while still logged in to the first account:

1. Quit iDVD and go to the Finder.
2. From the **Go** menu, choose **Go to Folder**.
3. In the resulting dialog, type `/tmp` and click Go.
4. From the tmp folder window, drag the file "tempmovie.mov" to the Trash.

You can now switch to a new user and create your DVD project.

This issue does not occur in iDVD 6, part of iLife ’06.

Published Date: Feb 18, 2012

iDVD burn button doesn‘t spin

This article has been archived and is no longer updated by Apple.

During stage 3 of the Processing and Burning process, the burn button in iDVD may not spin during audio encoding. The thumbnail progress image may display a still image or a black rectangle (what's being displayed is either the last slide of the slideshow or the last frame of the movie whose audio iDVD is encoding at the time). The longer the movie or slideshow, the longer the pause will be while the audio is encoded.

This does not mean that the process has stopped. Click here for more information.

Note: If you check Activity Monitor (/Applications/Utilities) and it indicates that some iDVD processes are not responding (such as encoding server), this does not mean that the DVD burning process has been interrupted. If you do check in Activity Monitor, also look at the "%CPU" column for iDVD. If the "%CPU" for an iDVD process is above 5, then iDVD is likely encoding.

QuickTime 7: Run Software Update a second time to get the QuickTime 7 SDK

This article has been archived and is no longer updated by Apple.

If you are using Mac OS X 10.3.9, QuickTime 7 will appear in Software Update as an available download. After installing it, your computer will restart. If you have Developer Tools for Mac OS X 10.3 Panther installed, and wish to continue using using the QuickTime SDK (Software Development Kit) after you have upgraded to QuickTime 7, you will need to download the QuickTime 7 SDK.

You can do this by running Software Update again after installing QuickTime 7. This will make the SDK available to download.

If you don't run Software Update manually at this point, the QuickTime 7 SDK will automatically appear in Software Update after a week (if you're using the default "Check for updates Weekly" setting in Software Update Preferences). If you want to get started with the SDK sooner, make sure that you manually run Software Update.

To learn more about the QuickTime 7 SDK or to manually download the update, please visit the QuickTime section of the Apple Developer Connection site.

Xsan may not work properly if the Mac OS X firewall is enabled

This article has been archived and is no longer updated by Apple.

When you enable the Max OS X firewall, Xsan Admin may not be able to see all systems on the SAN (storage area network), and clients may be unable to communicate with the metadata controller. Other Xsan issues may also occur.

For this reason, you should disable the Mac OS X firewall software on all systems running Xsan.

Published Date: Feb 18, 2012

Xsan: Metadata controllers should be on the same Ethernet network

This article has been archived and is no longer updated by Apple.

If you're using Xsan, make sure that all metadata controllers (MDCs) access the SAN (storage area network) on the same Ethernet network. Otherwise, clients and controllers will behave unexpectedly.

If you set up multiple MDCs on different Ethernet networks, you may see unexpected and undesirable behavior, such as:

- Clients have trouble with mounting volumes.
- Controllers don't fail over.
- Volumes start up on the wrong interface.

Final Cut Pro/Express HD: Single-screen Digital Cinema Desktop Preview is unavailable in Tiger

This article has been archived and is no longer updated by Apple.

The Digital Cinema Desktop (DCD) feature in Final Cut Pro HD 4.5 and Final Cut Express HD does not function in Main mode in Mac OS X 10.4 Tiger. This issue only occurs if you are using the feature in single-screen mode, which is referred to in documentation as "Digital Cinema Desktop Preview - Main." The other Digital Cinema Desktop Preview modes (which use two screens) work as expected.

This document will be updated as more information becomes available.

Mac OS X 10.3.9, 10.4: Some Apple applications don‘t open

This article has been archived and is no longer updated by Apple.

Some Apple applications might not open fully or at all if the Digidesign Core Audio driver has been installed as part of a Pro Tools version 6.9 installation. Digidesign products that rely on this driver include the Mbox, Digi 002, and HD systems. Audio MIDI Setup can usually be used to work around the issue.

Instead of opening, an application's icon just bounces in the Dock indefinitely. Or a black triangle appears below the icon in the Dock, but the application's windows and menus don't appear. These applications may be affected:

- QuickTime Player
- iTunes
- iDVD
- iMovie
- GarageBand
- Final Cut Express

Other Apple applications may also be affected.

Solution

Follow these steps to change the default audio device used by Core Audio:

1. Updating your Digidesign Core Audio driver may resolve the issue. You can find the latest versions for Mac OS X 10.3 (Panther) and Mac OS X 10.4 (Tiger) at http://digidesign.com/download/coreaudio. If that doesn't help, continue to step 2.
2. Open Audio MIDI Setup (/Applications/Utilities).
3. Click the Audio Devices tab.
4. From the **Default Output** pop-up menu, choose **Built-in Audio**.

You should now be able to open all affected applications as expected.

If this does not resolve the issue, shut down your computer and remove the Digidesign hardware.

If the issue still occurs, reinstall Mac OS X via an Archive and Install, which should resolve it.

Contact Digidesign for further assistance.

Mac OS X 10.4: Some VoiceOver key commands may not work with British ISO keyboards

This article has been archived and is no longer updated by Apple.

If you are using VoiceOver with an Apple British ISO keyboard (not an Apple English ANSI keyboard), some VoiceOver key commands will not work as expected.

If you press any of the following VoiceOver key commands, its designated function will not be performed:

- Typing a backslash (\\) will not open or close a disclosure triangle.
- Typing a tilde (~) won't resize a window.
- Typing an accent (`) won't move a window.

As a workaround, try using an Apple English ANSI keyboard with VoiceOver.

Tip: To view the available VoiceOver commands, open VoiceOver Utility (it's in /Applications/Utilities) and choose **VoiceOver Commands** from the **Help** menu, or download the VoiceOver Keyboard diagram in PDF format from this webpage.

This document will be updated as more information becomes available.

iDVD 5: Iomega REV disk may be erased when burning projects

This article has been archived and is no longer updated by Apple.

If you have an Iomega REV drive installed in or connected to your computer and you have a REV disk mounted, the disk may get erased if you attempt to burn an iDVD project.

iDVD features an erase-before-burn function, which allows it to rewrite data on DVD-RW and DVD+RW media. Because the REV drive represents itself as a rewritable DVD device to the operating system, if you don't have a rewritable DVD in your SuperDrive, the REV Disk will be erased and your iDVD project will be written to the REV Disk. Although the REV drive appears as a rewritable DVD, it is not supported for use with iDVD.

To prevent the REV disk from being erased, eject it before you burn an iDVD project.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

iPhoto: Can‘t see songs in slideshow music dialog

This article has been archived and is no longer updated by Apple.

In iPhoto, sometimes after you select the option to add music to a slideshow, you see your playlists but not your individual songs in the dialog sheet.

If this happens to you, try resizing the sheet by dragging the lower-right corner to make it bigger. You should eventually see a divider that separates the playlist pane from the song listings pane. Once you see this divider, click and drag it upward so that you can see items in both parts of the window more easily.

Published Date: Feb 19, 2012

iPhoto: Slideshows do not play full screen on some computers

This article has been archived and is no longer updated by Apple.

iPhoto allows you to view slideshows in full screen mode, but some computers won't allow you to do this. If you're using an affected computer, iPhoto 5.0.2 or later will display a black border around the edges of the screen to improve slideshow performance.

If you would like to play a slideshow without the border, consider exporting the slideshow as a QuickTime movie. You can then view the resulting movie in QuickTime Player or another application that can play movies in full screen mode.

Mac OS X: Internal modem not working

This article has been archived and is no longer updated by Apple.

Updating or upgrading to a version of Mac OS X from 10.3.7 to 10.4.1 might cause certain "dash" type internal modems supplied by Apple to stop working. Internet Connect may give you the message "Could not open the communications device."

You can use the System Profiler application to determine if your computer has a "Dash" modem.

1. From the **Apple** menu choose **About This Mac**.
2. In the resulting window, click More Info.
3. In System Profiler, click Modems in the list on the left side of the window.
4. If System Profiler shows the "Modem Model" as any version with "Dash" in the name, then you should continue with the troubleshooting steps in this article.

Solution for Mac OS X 10.3 Panther

If you're having this issue with Panther, you should contact AppleCare for assistance.

Solution for Mac OS X 10.4 "Tiger"

If you're having this issue with Tiger, update to 10.4.2 or later to resolve the issue. Since your modem isn't working, getting the update will take a little extra effort. Try downloading the standalone update to the computer you're reading this on, then burning it onto a disc to insert in the affected computer. If you don't have a burner, you could set up file sharing. You could also visit the Genius Bar at an Apple retail store, or transfer the file using your iPod as a disk. If you can easily transport your computer, taking it to a location with AirPort or Ethernet access to the Internet would also be a solution.

.Mac: Backup may revert to trial mode in Mac OS X 10.4 Tiger

This article has been archived and is no longer updated by Apple.

Mac OS X 10.4 Tiger provides the ability to reopen applications that have unexpectedly quit. On the first attempt, if you choose to reopen an application that has unexpectedly quit, it should open normally.

However, if it unexpectedly quits a second time, the Finder will offer to open the application using its default settings. If you choose to do this, the application gets temporarily set back to the original condition in which it came (before you did any customization). If you then quit and reopen the application, it will open with your normal user settings back in place.

If Backup 2.0.x unexpectedly quits twice in a row in Mac OS X 10.4, the application may open in Trial User mode on your second recovery attempt. In Trial User mode, Backup doesn't have access to your .Mac preferences. If this happens to you, just quit Backup and reopen it again to use your normal settings. You may see an alert message that asks if you want to save the new settings. Click No to use your old settings.

Mac OS: Chooser Defaults to Modem Port

This article describes why a serial printer driver may default to the modem port within the Classic Networking architecture.

This article has been archived and is no longer updated by Apple.
AppleTalk tends to take over the printer port when active, preventing a serial printer from using it. This causes the serial printer's driver to choose the modem port. To resolve this issue, turn off AppleTalk.

Making AppleTalk inactive (either in the Chooser or the AppleTalk control panel) is not sufficient, since the resources are loaded at startup.

Follow these steps to make AppleTalk inactive under Classic Networking:

1. Open the Chooser.
2. Click the Inactive button to make AppleTalk inactive.
3. Restart the computer.

To verify that AppleTalk is inactive, open the Chooser; the AppleTalk Inactive button should be set. Note that using file sharing or Apple Remote Access makes AppleTalk active again.

For additional information on how to turn off AppleTalk under Open Transport, please see article 24346: "**Mac OS: AppleTalk "Port in Use" Error**"

Additional Workaround

Install Apple Remote Access Client, which adds the option "Remote Only" to the AppleTalk Control panel. Choosing "Remote Only" routes AppleTalk to "Remote Only", freeing up your printer port for use by your serial printer.

Mac OS X 10.4: No results when searching Mail messages

This article has been archived and is no longer updated by Apple.

In Mac OS X 10.4 Tiger, if you want to search your Mail messages by typing keywords in the application's search box, Spotlight won't find any messages if it isn't allowed to index and search your Home folder. This is because Mail messages are stored in each user's Home folder.

Note: By default, Spotlight includes your Home folder in its searches. This issue only occurs if you specifically added your Home folder to the Privacy list.

To resolve this issue, use Spotlight preferences to remove your Home folder from the Privacy list. Then give Spotlight a few minutes (or more, depending on how large your Home folder is) to index your stuff, including your Mail messages. If you want to check indexing progress, click the Spotlight icon.

Logic Pro 7.1: Audio may leak from one Aux channel to another

This article has been archived and is no longer updated by Apple.

When certain Audio Unit plug-ins are inserted in an Aux, audio from other Aux channels can leak into the signal path. In the image below, Aux 2 shouldn't show any output, but it's receiving audio that Aux 1 is getting from Bus 1.

This does not occur with the built-in plug-ins in Logic, nor does it occur with all Audio Units.

As a workaround, assign a Logic "Gain" plug-in with default settings (so as not to affect the sound) in the first insert of the Aux channel. You may then use any Audio Unit plug-in in the following slots without audio leakage.

This document will be updated as more information becomes available.

Apple Pro Training Final Cut Studio Tutorial overview

This article has been archived and is no longer updated by Apple.

Final Cut Studio, Final Cut Pro 5, DVD Studio Pro 4, Soundtrack Pro, and Motion 2 all come with two DVDs—the Apple Pro Training Final Cut Studio DVD Tutorial and Apple Pro Training Final Cut Studio Tutorials—that are filled with beginning and advanced tutorials and training lessons to help you learn more about the applications. Here's a look at what each DVD offers.

Apple Pro Training Final Cut Studio DVD Tutorial

The Apple Pro Training Final Cut Studio DVD Tutorial is an interactive DVD tutorial that gives you an excellent overview of Final Cut Pro 5, Motion 2, Soundtrack Pro, and DVD Studio Pro 4 (all the applications included in Final Cut Studio). The tutorial takes you through each of the applications' interfaces and primary features, including a tour of some of the most important new features. This is an interactive teaching tool, with lesson files and media included on the DVD so you can work through real-world projects as you learn.

Even if you don't have every application in Final Cut Studio, you can still watch this DVD training disc on your computer or NTSC-compatible set-top player to learn about all the products.

Apple Pro Training Final Cut Studio Tutorials

The Apple Pro Training Final Cut Studio Tutorials are step-by-step, project-based lessons—the equivalent of about 8 hours of training—in PDF format. All tutorials come with accompanying project and media files for you to use. The disc includes tutorials for both new and experienced users, and covers Final Cut Pro 5, Motion 2, Soundtrack Pro, and DVD Studio Pro 4. Here are the lessons it contains.

Lesson 1: Introducing Final Cut Pro
This step-by-step tutorial to the cornerstone application of Final Cut Studio guides you through the process of editing two projects. As you edit, you'll discover the primary aspects of the Final Cut Pro interface, and become familiar with its basic operation, including navigating through a sequence, opening and marking clips, assembling clips, basic trimming and editing techniques, adding transitions and filters, and using nested sequences.
Approximate lesson time: 1 hour

Lesson 2: Mastering Final Cut Pro
This advanced tutorial covers some of Final Cut Pro's most exciting new features and more advanced techniques. You'll work with multiple clips to create a multi-angle montage and a multi-camera edit. Then you'll use advanced effects techniques to animate opacity, change speeds, apply basic color correction, modify a nested sequence, and composite images. You'll use all of these techniques to build a promo for the show "Capturing the eXtreme" for the fictitious eXtreme Living Channel.
Approximate lesson time: 1 hour

Lesson 3: Introducing Motion
This introductory-level lesson takes you through the process of creating a Motion project from start to finish. After exploring the Motion interface, you'll work with some of Motion's most exciting features, including animated text, filters, behaviors, and particles, as you build a 10-second promo for the fictitious eXtreme Living Channel. See the Late-Breaking News section below for a correction to the steps for importing a Motion project.
Approximate lesson time: 45 minutes

Lesson 4: Mastering Motion
This advanced tutorial focuses on some of Motion's most powerful new features and more advanced techniques. You'll learn to work with replicators, the 3D filter, image masks, generators, and keyframed animations to build a "Coming Up Next" bumper for the fictitious eXtreme Living Channel.
Approximate lesson time: 1 hour

Lesson 5: Introducing Soundtrack Pro
This hands-on tutorial is designed to give you an overview of the Soundtrack Pro interface and some of the application's professional sound design features as you build and mix a project. You'll learn to arrange audio clips in the Timeline, synchronize audio and video, automate volume and pan levels, edit audio files, reduce noise, normalize a voiceover, add effects, and create a mix. Along the way, you'll also learn some handy keyboard shortcuts and sound design tricks.
Approximate lesson time: 1 hour, 15 minutes

Lesson 6: Introducing DVD Studio Pro
In this introductory-level tutorial to DVD Studio Pro, you'll use the application's Basic configuration to author a simple DVD containing one track, a slideshow, and one menu. You'll learn how to modify an existing menu template to your own design, create custom buttons, and connect your assets for a DVD. By working through a few of the basics, you'll have a solid foundation, and be ready to tackle your next project.
Approximate lesson time: 1 hour

Lesson 7: Mastering DVD Studio Pro
This advanced tutorial explores techniques for designing more advanced menus in DVD Studio Pro, including how to create motion menus, transitions, subtitles, and more. You'll be authoring a DVD to promote a fictitious show, "Shark Encounter," on the eXtreme Living Channel. The

project includes a slideshow of the production, a movie track, chapter index menus, and alternate angles.
Approximate lesson time: 1 hour, 15 minutes

Late-Breaking News

While using the tutorials, you may encounter the following issues:

Apple Pro Training Final Cut Studio DVD Tutorial
After dragging the Final Cut Studio Training folder to your computer's hard drive, it will be set to "Read Only" by default. This will prevent you from saving projects to that folder. To change this, do the following:

1. Select the Final Cut Studio Training folder on your hard drive and choose **File > Get Info**.
2. In the "Ownership and Permissions" section, choose **Read and Write** from the **You can** pop-up menu.
3. In the "Details" section, click the "Apply to enclosed items" button. You will now be able to save to this folder.

Apple Pro Training Final Cut Studio Tutorials
With the Mastering DVD Studio Pro finished project, you may see a "Max Bitrate Too High" error if you try to build a DVD. To resolve this issue:

1. Re-encode the AIFF audio files to AC3 using Compressor.
2. Replace the AIFF files with the AC3 files in "2_Mst_DVDSP."

Correction to Importing a Motion Project tutorial steps

Follow these steps instead of following the Importing a Motion Project File section of the Motion tutorial:

1. Move the playhead to the first frame of the project (press Home key).
2. Click the File Browser tab or press Command-1 to open the File Browser.
3. In the Media folder, click the eXtreme Living Text Motion project from the Media folder on the lower pane to see it in the Preview area.

   This is a simple Motion project containing two text objects with Text-Fade behaviors.
4. Click the Import button to import the selected file. The eXtreme Living text is imported to the project, at the playhead position, and automatically centered in the frame. Move playhead to frame 200.
5. Play the project in the Canvas to see the new imported text elements.
6. Move the playhead to the first frame of the project (press the Home key).
7. Click the 4 text file in the lower pane to preview it. This Motion project contains four text objects with Fade In/Fade out behaviors. You'll place the file at the lower-left corner of the frame.
8. Drag the 4 text file from the lower pane to the lower-left corner of the frame in the Canvas. Move playhead to frame 60.

Xsan 1.0 and later: Second volume may not appear on slower systems

This article has been archived and is no longer updated by Apple.

When mounting more than one volume on older Xsan-supported Power Mac G4 desktop systems, additional volumes may not appear on the Desktop when you're using Xsan. If this happens to you, try one of the following methods to mount the volume.

- In Terminal, enter the following command:

  ```
  $ disktoool -r
  ```

- Relaunch the Finder using the Force Quit command (choose **Apple > Force Quit**).

Published Date: Feb 19, 2012

Xsan: Volume that hosts home directories may not mount

This article has been archived and is no longer updated by Apple.

Under certain circumstances, an Xsan volume may not mount after you restart an Xsan workstation. If you try to mount the volume with Xsan Admin, that may not work either.

This issue may occur when logging into an Xsan client computer with a user account whose home directory is located on an Xsan volume. If the login or automatic login occurs before the Xsan volume has mounted, the operating system will attempt to fulfill the automount instruction by locally creating a substitute home directory that has the same pathname as the intended mount:

```
/Volumes/<XsanVolumeName>/<PathToHomeDirectory>
```

where `<XsanVolumeName>` is a local directory (not the actual Xsan volume) that shares the same name as the Xsan volume. Because the OS created this folder with the same name as the Xsan volume, the actual Xsan volume won't be able to mount.

To avoid this situation, make sure that the Xsan client's IP address and hostname are resolvable via DNS (if you are running Xsan clients with dual interfaces on separate subnets, only the primary interface, which should be the public interface, needs to be resolvable via DNS). To verify this:

1. Open Network Utility.
2. Click the Lookup tab.
3. Enter the IP address of the client's primary Ethernet interface, and click Lookup.
4. Check to see if the result is a Fully Qualified Domain Name.
5. Now replace the IP address with the Fully Qualified Domain Name that should belong to the workstation, and click Lookup again.
6. Make sure that the result is the same as the IP address you entered in step 3.
7. If either of these tests fails to deliver the desired result, contact the person who administers DNS on your network for assistance.

If the operating system created a new home directory due to this issue as described above, you'll need to delete the directory that bears the same name as the Xsan volume (do **not** delete the actual Xsan volume). First, be sure to examine the contents of the directory and back up any data that may have been saved there. Then use the following command in Terminal to delete the directory:

```
sudo rm -r /Volumes/<XsanVolumeName>
```

where `<XsanVolumeName>` is the name of the directory that was created. After you delete it, Xsan Admin should be able to mount the Xsan volume.

About the Mail Server Update for Mac OS X Server 10.3.9

This article has been archived and is no longer updated by Apple.

The Mail Server Update for Mac OS X Server 10.3.9 delivers overall improved reliability, and is recommended for all Mac OS X 10.3.9 servers.

Installing the update

You can update your server in one of two ways: Use Software Update or update from a standalone installer.

Software Update installation
Software Update may have referred you to this document. For more information on using this feature, see "Mac OS X: Updating your software."

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer
A standalone installer is also available from Apple Downloads.

Reconstructing the cyrus database (optional)

This update addresses an issue in which cyrus mail services on Mac OS X Server 10.3.9 may eventually stop working, leaving the mail database in an unsettled state after the cyrus mailbox database has been reconstructed.

If you have already encountered mail server issues, you should reconstruct the cyrus mailbox database using these steps:

1. Stop the cyrus (IMAP/POP) server.
2. Execute the following command in Terminal:

```
sudo -u cyrus /usr/bin/cyrus/bin/reconstruct -i
```

3. Restart the cyrus (IMAP/POP) server, and verify that mail is working.

Published Date: Oct 7, 2016

About the Mac OS X Server 10.4.2 Update

This article has been archived and is no longer updated by Apple.

This software updates Mac OS X Server version 10.4.1 to version 10.4.2.

Important: Please Read Before Installing

- You must have an administrator account password that does not contain spaces or Option-keyed characters to install this update. The password may not be left blank (you can change your password if needed).
- You may experience unexpected results if you've installed third-party system software modifications, or if you have modified the operating system through other means. This doesn't apply to normal software installation.
- The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.
- This update can be installed on non-startup volumes, but you should only do this if the current startup volume has already been updated to Mac OS X Server 10.4.2. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are two ways to update to Mac OS X Server 10.4.2: Use Software Update or install from a standalone installer.

Software Update Installation

Software Update may have referred you to this document. For more information on this feature, see "How to Update Your Software."

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

A standalone installer is also available from Apple Downloads. The Mac OS X Server 10.4.2 Update is specifically for updating version 10.4.1 to version 10.4.2. There is also a "Combo Update" installer available, which will update any version of 10.4 to 10.4.2.

Remote Installation

If you need to install the update on a remote computer, you can do so using the "softwareupdate" command-line tool.

Enhancements

The following items are some of the enhancements and improvements in Mac OS X Server 10.4.2 Update:

Mail Services

- Upgrades SpamAssassin and ClamAV to include additional support for TNEF (winmail.dat) files and new detection mechanisms for JPEG-based exploits.

servermgrd

- Addresses an issue in which Product License Keys may be reported as invalid due to case sensitivity.

Workgroup Manager

- Addresses issues with the creation of custom home directories specified within a subdirectory of a sharepoint.
- Addresses compatibility issues for administration of a 10.3.9 server from a 10.4 system with 10.4 admin tools.

Xgrid Admin

- Addresses an issue which prevented the Xgrid Admin application from securely connecting to controllers that required Kerberos authentication.
- Addresses an issue which may have prevented controllers from sending files to agents.

- Improvements made for batch jobs sent through the command line.

Open Directory

- Addresses an issue that prevents systems from connecting to Windows 2003 Active Directory deployments.
- Addresses an issue in which systems stop authenticating through Active Directory.
- Addresses an issue in which Active Directory users who are set as computer administrators may not get admin access to a computer.
- Addresses an issue that prevents Mobile Accounts from authenticating with Active Directory.
- Addresses an issue where the DirectoryService process may stop after waking from sleep.
- Addresses an issue in which newly-created accounts may not be able to authenticate or appear in user lists.
- Addresses an issue where Password Server may stop working, causing authentications to fail when replicated Password Servers are used.
- Addresses an issue where kerberos authentications may fail after importing a large number of users (60,000 or more).

Apple File Services

- Addresses an issue where Apple File Services may pause indefinitely after experiencing heavy loads.
- Addresses an issue which prevented Apple File Services from setting inherited permissions in nested folders within shared volumes.
- Addresses an issue where multiple automounts from a single client would incorrectly count against 10-client Server licenses.

Disk Imaging

- Addresses an issue which may have caused failure reports when used with large volumes.

Managed Users

- Addresses an issue which prevented some Login Window management options from being honored.

NFS

- Addresses issues which may have caused the mountd process to crash when NFS is used to host HFS volumes.

SMB

- Improves handling of workgroup and file names when connecting and copying to shared SMB volumes.
- Addresses issues causing -36 connection failures when connecting to SMB shared volumes with an old keychain password.
- Addresses an issue that may cause kernel panics on multiple Xsan systems when unmounting Xsan volumes.

Xsan: Clients may reduce number of available licenses when integrated with a StorNext network

This article has been archived and is no longer updated by Apple.

If you're using any version of Xsan with ADIC StorNext 2.4 to 2.5 systems, the StorNext metadata controller may report that Xsan clients are taking from the pool of available ADIC StorNext licenses. If a client tries to mount storage in this mixed environment, it may get a permission denied message.

You can resolve this issue by updating all ADIC StorNext computers to StorNext version 2.5.1 or later. You can find more information about this and other ADIC bulletins on this page:

http://www.quantum.com/ServiceandSupport/SoftwareandDocumentationDownloads/SupportBulletins/Index.aspx#storNext

For this specific issue, please refer to StorNext Product Bulletin #9 (May 2005).

Important: Information about products not manufactured by Apple is provided for information purposes only, and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Xsan 1.0: The command "cvadmin" may not stop the volume

This article has been archived and is no longer updated by Apple.

If you set up Xsan 1.0 or 1.0.1 with backup metadata controllers (MDCs) and subsequently try to stop the volume using the "cvadmin" command line tool, your primary MDC will failover to the backup MDC.

Instead of using "cvadmin," use Xsan Admin to stop the volume.

About the Mac OS X Server 10.4.2 Update (Combo)

This article has been archived and is no longer updated by Apple.

This software updates Mac OS X Server versions 10.4 and 10.4.1 to Mac OS X Server 10.4.2. It is a "combo" update that combines enhancements delivered with versions 10.4.1 through 10.4.2. If you already have Mac OS X Server 10.4.1, you can download a smaller update to update to version 10.4.2.

Important: Please Read Before Installing

- You must have an administrator account password that does not contain spaces or Option-keyed characters to install this update. The password may not be left blank (you can change your password if needed).
- You may experience unexpected results if you've installed third-party system software modifications, or if you have modified the operating system through other means. This doesn't apply to normal software installation.
- The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.
- This update can be installed on non-startup volumes, but you should only do this if the current startup volume has already been updated to Mac OS X Server 10.4.2. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are two ways to update to Mac OS X Server 10.4.2: Use Software Update or install from the standalone installer.

Software Update Installation

Software Update may have referred you to this document. For more information on this feature, see "How to Update Your Software."

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

A standalone installer is also available from Apple Downloads.

Remote Installation

If you need to install the update on a remote computer, you can do so using the "softwareupdate" command-line tool.

Enhancements delivered with this update

This update delivers many enhancements. Because this is a combo update, it includes enhancements that are delivered with both 10.4.1 and 10.4.2 updates. You can see the individual enhancement lists for 10.4.1 and 10.4.2 updates.

GarageBand 2: Rhythmic values in notation display don‘t match sound

This article has been archived and is no longer updated by Apple.

When viewing music notation in GarageBand 2, the notation that represents a MIDI recording or loop may not always match the exact rhythm that you hear. This happens because rhythmic values are sometimes rounded up to a longer value.

For example, a section of sixteenth notes may display as eighth note triplets. (To view the notation display, double-click a Software Instrument loop or MIDI recording—any green region—to open it in the editor, then click the music note button in the editor's Region pane.)

GarageBand allows you to adjust the notation display grid to make the music more readable, and it quantizes the display without affecting the actual sound of the recording, since (in most cases) you won't hold notes for their fully displayed values. This can help when you play a series of staccato notes, for example. You can adjust the display to show them as eighth notes rather than as a combination of thirty-second notes and rests.

To adjust the display grid setting, click the grid button in the upper-right corner of the Notation Editor (the button that looks like a ruler to the right of the measure bar). A pop-up menu appears, listing the available note value settings. Choose a value that will allow the shortest notes in your selected recording to be displayed. The notation display will round up the displayed duration of all notes to the nearest time division as determined by your grid selection.

For example, if you make a MIDI recording that contains sixteenth notes but set the grid to eighth notes, the display will show groups of sixteenth notes as eighth note triplets because this is the closest rhythmic value it can display at that grid setting. Keep in mind that your recording will always sound exactly as you played it—no matter what grid setting you choose here; only the visual display of the notation changes.

- 300719: GarageBand: Enhance Timing may place notes after the end of the region

Published Date: Feb 18, 2012

GarageBand 2: Enhance Timing results vary according to audio content

This article has been archived and is no longer updated by Apple.

The Enhance Timing feature in GarageBand 2 works best on tracks that contain single parts. Because a typical drum loop contains several different rhythms across multiple sounds, such as the hi hat, kick drum, and snare, each drum part may have a different rhythmic bias that will affect the behavior of Enhance Timing. In some cases this makes it impossible for Enhance Timing to give useful results.

In contrast to the MIDI quantize feature, Enhance Timing depends on the content of the file. Any audio file that contains mixed rhythms may present issues for Enhance Timing. Drum loops are the most common example.

Mac OS X: Use latest third-party device drivers and firmware for best compatibility

This article has been archived and is no longer updated by Apple.

When using a third-party hardware device with any version of Mac OS X, it's a good idea to use the latest versions of the device's driver and firmware (that work with your operating system) available from the device's manufacturer—especially after you've upgraded. Otherwise, the device might not work, even if it worked with a previous version of Mac OS X.

Third-party devices include everything from printers to storage devices to SCSI cards.

GarageBand 2: Playhead location can affect software instrument sound

This article has been archived and is no longer updated by Apple.

Sometimes the position of the playhead along the timeline can affect the sound of Software Instruments being played live. For example, in Jam Pack 4, many Software Instruments allow you to choose different articulations by mapping data from the modulation wheel on your MIDI controller.

The instrument remembers the last articulation setting it sees, whether it's from a recorded track or sent live as you play. However, when you move the playhead, the most recent recorded articulation for each track will be sent, which may be different than the one you're expecting. You can reset the articulation for the current active track by moving your controller's modulation wheel.

GarageBand 2: Pitchbend in Musical Typing doesn‘t work with some note combinations

This article has been archived and is no longer updated by Apple.

If you're using the Musical Typing feature to play notes in GarageBand 2, please note that the Pitchbend buttons on the Musical Typing keyboard (and their corresponding keys on your Mac keyboard) will not work when you play certain note combinations. This is a known issue.

If you play a C note (by pressing the A key on your Mac keyboard) along with any other "white key" note—D, E, F, G, A, or B—the Pitchbend down button (the 1 key on your Mac keyboard) will not work. If you play a D note (by pressing the S key) with any other "white key" note, the Pitchbend up button (the 2 key on your Mac keyboard) will not work.

If you play a C and D note together (by pressing both the A and S keys), then neither Pitchbend button will work. All other note combinations work as expected. If you need to apply pitchbend to a chord that uses an affected combination of notes, you can add it after you record the chord from the Musical Typing keyboard, using the editor.

This document will be updated as more information becomes available.

QuickTime 7.0.1: Security enhancements

This article has been archived and is no longer updated by Apple.

This document describes the security enhancements included with QuickTime 7.0.1, which can be downloaded and installed using Software Update, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How To Use The Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

QuickTime 7.0.1

- QuickTime Quartz Composer Plugin

CVE-ID: CAN-2005-1334
Available for: QuickTime 7.0
Impact: With QuickTime 7.0, a QuickTime movie containing a maliciously crafted Quartz Composer object can leak data to an arbitrary web location.
Description: Quartz Composer objects can be wrapped in a QuickTime track and delivered as a QuickTime movie. With QuickTime 7.0, a Quartz Composer object can gather local data and send it using an encoded URL to an arbitrary web location. The QuickTime 7.0.1 update modifies the QuickTime Quartz Composer Plugin to prevent access to remote web locations. Credit to David Remahl (www.remahl.se/david) for reporting this issue.

Final Cut Pro 5 : Capturing HDV creates new clips at scene breaks

This article has been archived and is no longer updated by Apple.

When you capture HDV footage, Final Cut Pro can automatically create new clips and corresponding media files each time it detects a scene or timecode break. This behavior is slightly different from the way it handles DV footage.

When you capture DV, Final Cut Pro can detect scene breaks after capture if you select the clip and choose **Mark > DV Start/Stop Detect**.

When you capture HDV, Final Cut Pro automatically generates a new media file at the point of each scene break. The chosen option in the **On timecode break** pop-up menu determines how timecode breaks affect the capture; Final Cut Pro disregards the Warn After Capture option to avoid capturing media files that contain breaks in the middle of an MPEG-2 GOP (Group of Pictures).

To determine how scene and timecode breaks are handled when you capture HDV:

1. Choose **Final Cut Pro > User Preferences**, then click the General tab.
2. Choose one of the following options (described below) from the **On timecode break** pop-up menu:

   Make New Clip
   This is the default option. Whenever Final Cut Pro detects a scene or timecode break during capture, it finishes writing the current media file to disk and then begins capturing a new media file. It also creates a corresponding clip for each new media file in the Browser. To ensure that all new media files and clips have unique names, it appends a number to the filename of each new media file and clip generated by scene and timecode break detection.

   For example, let's say that you're capturing a media file named "Cafe Wide Shot," and Final Cut Pro detects a scene or timecode break. At the break detection point, Final Cut Pro begins capturing a new media file named "Cafe Wide Shot-1." If there is already a media file named "Cafe Wide Shot-1," the new media file is named "Cafe Wide Shot-2," and so on.

   Abort Capture
   If you choose this option, Final Cut Pro stops capture immediately when it detects a timecode break. All media captured before the timecode break has frame-accurate timecode, and is preserved. Final Cut Pro saves the resulting media files and places the corresponding clips in the Browser.

   Warn After Capture
   When you capture HDV, this option behaves identically to the Abort Capture option.

This document contains information from the "HD and Broadcast Formats" PDF included with Final Cut Pro.

Motion 1.0: Some filters don‘t work in Mac OS X 10.4 Tiger

This article has been archived and is no longer updated by Apple.

If you are using Motion 1.0 on a computer with Mac OS X 10.4 Tiger, you won't be able to apply some filters to objects in a Motion project. This issue does not occur with Motion 2.

To resolve this issue, update to Motion 1.0.1.

Published Date: Oct 7, 2016

iChat: Issues when logging in to AIM from more than one computer or device

This article has been archived and is no longer updated by Apple.

If you try to log in to an AIM account via iChat that's already in use on a different computer, you may experience some login issues. Here's what can happen if you try to do this. As a general rule, you should only log in to your iChat account on one computer at a time.

Note: This document doesn't apply to Bonjour or Jabber messaging.

Mac OS X 10.4 Tiger

If you log in to iChat with an AIM account on a Mac OS X 10.4 Tiger computer and then log in with the same account on a different computer that has Mac OS X 10.4, 10.3.9, or an earlier OS installed (or via a Windows-based PC, cell phone, or PDA device), your iChat session will disconnect (log out) on the Tiger computer (you'll be connected on your second computer or device). No alert will display on either computer/device when this happens.

Mac OS X 10.3.9 or earlier

If you try to log in to the same AIM account using iChat on two different computers or devices with Mac OS X 10.3.9 or earlier, the following alert appears in iChat on both computers:

> Your screen name (*account name*) is now signed into AOL(R) Instant Messenger(TM) in 2 locations. To sign off the other locations, reply to this message with the number 1.

If you reply with "1," the first computer from which you logged in to iChat will be logged off (set to offline). If you ignore the message or don't reply with "1" (and both Macs remain logged in), both computers will receive all replies to messages you send, which could cause confusion when you go back to the first computer.

This document will be updated as more information becomes available.

Mac OS X 10.3, 10.4: "Nothing to install" alert when trying to install Classic Support

This article has been archived and is no longer updated by Apple.

If you're trying to install Classic Support from your Mac OS X 10.3.7 or Mac OS X 10.4 Install disc that came with your computer but get a "You cannot continue. There is nothing to install" message, fear not. Just follow these steps to install Classic Support:

1. In the Installer, click the Customize button.
2. Select the checkbox next to the language you want to install.

   Tip: Make sure that the checkbox is selected, and that "Install" appears in the Action column as shown below, before you proceed. Otherwise, you will continue to see this alert message.

3. Click Install.

Note: Do not click the "Easy Install" button. If you do, the same message will appear.

About the Mac OS X 10.4.2 Update (Combo)

This article has been archived and is no longer updated by Apple.

This software updates Mac OS X 10.4 Tiger or 10.4.1 to version 10.4.2.

Important: Please read before installing

- You may experience unexpected results if you have third-party system software modifications installed, or if you have modified the operating system through other means. (This does not apply to normal application software installation.)
- The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to update.
- If issues occur during installation—for example, Software Update quits unexpectedly—please see this document.

Installation

You have two ways to update to Mac OS X 10.4.2: Use Software Update or the standalone installer. You only need to use one of these methods to update your computer.

Automatic Software Update
Software Update, located in System Preferences, can automatically download and install the latest Apple software. Software Update may have linked you to this document for additional information about the update.

The update's size may vary from computer to computer when installed using Software Update.

Because some updates are prerequisites for others, you may need to run Software Update more than once to get all available updates.

Standalone installer
Two versions of the installer (Delta and Combo, described below) are available from Apple Downloads as standalone updates. After you download an update, you can use it to update your computer without being connected to the Internet.

- The Delta Update installer (described in a different document) will update *Mac OS X 10.4.1 to 10.4.2*.
- The Combo Update installer will update *Mac OS X 10.4 or 10.4.1 to 10.4.2*.

The standalone installer, particularly the Combo Update, is useful if you have multiple computers to update and only want to download the update once.

Improvements

This update offers many reliability and compatibility improvements. To see a list of some of them, check out the Improvements section of this document.

This update also includes enhancements delivered with the Mac OS X 10.4.1 Update.

Logic Pro/Express: Rewire audio drops out completely

This article has been archived and is no longer updated by Apple.

Note: The issue described below is resolved in Logic Pro/Express 7.2 or later.

When you cycle audio in Logic, and the SPL (Song Position Line) reaches the end of the cycle zone and jumps back to the beginning, Rewire audio streams may drop out completely. If you stop playback and then start it again, the audio returns.

This issue occurs if the selected track in the Arrange window is an Audio Instrument track whose LFO is tempo synced to the song. For example, if you assign the ES2 synth to the selected track and set its LFO to 1/16, 1/8, and so forth, this issue will occur.

This doesn't happen if you set the instrument's LFO to a specific rate, such as 1.12 Hz. If you select a different track in the Arrange window, the issue will not occur.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

About Security Update 2005-006

This article has been archived and is no longer updated by Apple.

This document describes Security Update 2005-006, which can be downloaded and installed using Software Update, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred, and any necessary patches or releases are available. To learn more about Apple Product Security, visit the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to Use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Security Update 2005-006

- **AFP Server**
  CVE-ID: CAN-2005-1721
  Available for: Mac OS X v10.4.1, Mac OS X Server v10.4.1
  Impact: A buffer overflow in support for legacy clients could permit the running of arbitrary code.
  Description: The Mac OS X AFP Server supports a number of legacy clients. A buffer overflow in support for one of these clients could permit arbitrary code to run. This update modifies the AFP Server to correct this buffer overflow. This issue does not affect systems prior to Mac OS X 10.4.

- **AFP Server**
  CVE-ID: CAN-2005-1720
  Available for: Mac OS X v10.4.1, Mac OS X Server v10.4.1
  Impact: On an AFP Server that uses an ACL-enabled volume for storage, copying a file with POSIX-only permissions can leave an ACL attached.
  Description: When copying a local file to an AFP Server that is using an ACL-enabled volume for storage, a temporary ACL is attached to the remote object during the copy process. This ACL can be left behind if the file copy went into a directory that was not using ACLs. The ACL that is left behind could cause confusion, as it will override the POSIX file permissions for the file owner. The ACL does not permit other users to access the file. This update modifies the AFP Server so that it correctly removes the ACL that is used for copying the file. This issue does not affect systems prior to Mac OS X 10.4.

- **Bluetooth**
  CVE-ID: CAN-2005-1333
  Available for: Mac OS X v10.4.1, Mac OS X Server v10.4.1, Mac OS X v10.3.9, Mac OS X Server v10.3.9
  Impact: Directory traversal via Bluetooth object exchange
  Description: Due to insufficient input checking, the Bluetooth object exchange services could be used to access files outside of the default file exchange directory. This update provides an additional security improvement over the previous release by adding enhanced filtering for path-delimiting characters. Credit to kf_lists[at]digitalmunition[dot]com for reporting this issue.

- **CoreGraphics**
  CVE-ID: CAN-2005-1722
  Available for: Mac OS X v10.4.1, Mac OS X Server v10.4.1
  Impact: Applications that use either PDFKit or CoreGraphics to render poorly-formed PDF documents could abort due to a NULL pointer dereference.
  Description: If a poorly-formed PDF document is passed to PDFKit or CoreGraphics for rendering, the rending engine will detect an error and stop processing. As part of the cleanup process, a check for a NULL pointer is omitted. This omission can cause an application that handles PDF documents to abort, requiring that the application be restarted. CoreGraphics is updated to correctly handle the cleanup of poorly-formed PDF documents. This issue does not affect systems prior to Mac OS X 10.4. Credit to Chris Evans for reporting this issue.

- **CoreGraphics**
  CVE-ID: CAN-2005-1726
  Available for: Mac OS X v10.4.1, Mac OS X Server v10.4.1
  Impact: Console users can gain root privileges.
  Description: The CoreGraphics Window Server is updated to disallow unprivileged users from launching commands into root sessions. This issue does not affect systems prior to Mac OS X v10.4.

- **Folder Permissions**
  CVE-ID: CAN-2005-1727
  Available for: Mac OS X v10.4.1, Mac OS X Server v10.4.1
  Impact: Potential file race condition via world- and group-writable permissions on two directories.

Description: Secure folder permissions are applied to protect the system's cache folder and Dashboard system widgets. This exposure does not exist in systems prior to Mac OS X v10.4. Credit to Michael Haller at info@cilly.com for reporting this issue.

- **launchd**
  CVE-ID: CAN-2005-1725
  Available for: Mac OS X v10.4.1, Mac OS X Server v10.4.1
  Impact: The setuid program launchd can allow local privilege escalation.
  Description: A vulnerability in launchd allows local users to gain ownership of arbitrary files. The launchd command is updated to safely change ownership of files. Credit to Neil Archibald of Suresec LTD for reporting this issue. This issue does not affect systems prior to Mac OS X v10.4.

- **LaunchServices**
  CVE-ID: CAN-2005-1723
  Available for: Mac OS X v10.4.1, Mac OS X Server v10.4.1
  Impact: File extensions and mime types marked as unsafe but not mapped to an Apple UTI could bypass download safety checks.
  Description: Mac OS X 10.4 contains a database of known unsafe file extensions and mime types. If an addition to the unsafe types database was made without a corresponding Apple UTI (Uniform Type Identifier), then a query on certain forms of the file extension or mime type would not be marked as unsafe. All entries in the current unsafe type database are mapped to an Apple UTI. This update corrects the query code to correctly identify unsafe file extensions and mime types regardless of the presence of an Apple UTI. This issue does not affect systems prior to Mac OS X 10.4.

- **MCX Client**
  CVE-ID: CAN-2005-1728
  Available for: Mac OS X v10.4.1, Mac OS X Server v10.4.1
  Impact: Portable Home Directory credentials may be available to local system users.
  Description: MCX Client is updated to not log portable home directory mounting credentials. This issue does not affect systems prior to Mac OS X v10.4.

- **NFS**
  CVE-ID: CAN-2005-1724
  Available for: Mac OS X v10.4.1, Mac OS X Server v10.4.1
  Impact: An NFS export that's restricted using -network and -mask flags will export to "everyone."
  Description: The use of -network and -mask on a filesystem listed in the NFS exports file would result in that filesystem being exported to "everyone." This update modifies the NFS exporting code to correctly set the network and mask parameters. This issue does not affect systems prior to Mac OS X 10.4.

- **PHP**
  CVE-ID: CAN-2005-0524, CAN-2005-0525, CAN-2005-1042, CAN-2005-1043
  Available for: Mac OS X v10.4.1, Mac OS X Server v10.4.1, Mac OS X v10.3.9, Mac OS X Server v10.3.9
  Impact: Multiple vulnerabilities in PHP, including remote denial of service and execution of arbitrary code.
  Description: PHP is updated to version 4.3.11 to address several issues. The PHP release announcement for version 4.3.11 is located at http://www.php.net/release_4_3_11.php.

- **VPN**
  CVE-ID: CAN-2005-1343
  Available for: Mac OS X v10.4.1, Mac OS X Server v10.4.1
  Impact: A local user can obtain root privileges if the system is being used as a VPN server.
  Description: A buffer overflow in "vpnd" could be used by a local user to obtain root privileges if the system is configured as a VPN server. This issue does not occur on systems that are configured as a VPN client. This issue cannot be exploited remotely. This update prevents the buffer overflow from occurring. This issue was fixed for Mac OS X v10.3.9 via Security Update 2005-005. Credit to Pieter de Boer of the master SNB at the Universiteit van Amsterdam (UvA) for reporting this issue.

Motion: How to use Symbol and Zapf Dingbats fonts in projects

This article has been archived and is no longer updated by Apple.

When adding text to a Motion project, you must use the Character Palette when working with non-unicode fonts such as Symbol and Zapf Dingbats.

With unicode fonts, you can enter text using your computer keyboard. If you wish to use non-unicode fonts in Motion, follow the instructions in this article to access the Character Palette and insert the symbols in these fonts.

Mac OS X 10.4: Expanding the list of candidate characters in Traditional Chinese input methods

This article has been archived and is no longer updated by Apple.

Some Traditional Chinese input methods in Mac OS X 10.4 Tiger, such as Pinyin, limit the number of candidate characters presented. You can display all candidate characters if you use the Cangjie, Jianyi, or Dayi input methods and also disable the dynamic prompt.

Tip: If you are using the Pinyin input method, switch to Hanin instead. Simply choose **Hanin** from the **Input** menu.

Follow these steps:

1. Open International preferences (from the **Apple** menu, choose **System Preferences**, then click International) and configure the Input Menu so that it displays the input method (or methods) you want (the steps here explain how to do this).
2. From the **Input** menu, choose **Preferences**.

3. An unnamed window appears with preference choices. Click the Typing tab.
4. Deselect the "Dynamic Prompt" checkbox.
5. Close the window.

Remote Desktop 2: Pressing the Help key interrupts administrator control of client

This article has been archived and is no longer updated by Apple.

If an administrator presses the Help key on an extended keyboard while controlling a client, it will interrupt the administrator's control of the client. The admin's mouse will still control the client's mouse, but the admin's keyboard input will no longer act as the client's keyboard.

To return the control session to normal (dismissing the Help mode), click the mouse or type on the keyboard of the controlled computer.

This document will be updated as more information becomes available.

Final Cut Pro 5: About the Shift Fields filter

This article has been archived and is no longer updated by Apple.

Final Cut Pro 5 features a new filter called Shift Fields. You may have noticed that this filter sometimes gets applied to your clips automatically. This happens when you mix video from different sources into a sequence (known as a mixed-format sequence); the Shift Fields filter will automatically adjust the field dominance so that all clips are uniform.

Automatic field dominance correction

When you add a clip to a sequence, Final Cut Pro checks to make sure that the field dominance of the incoming clip's media file matches the field dominance of the sequence. If it doesn't match, Final Cut Pro automatically applies the Shift Fields filter to the clip to make it match the sequence's field dominance. Without the filter, the clip would stutter during playback because the fields would play in the wrong order. This is especially noticeable when you view your video on an external NTSC or PAL video monitor.

Adjusting the Shift Fields filter

The Shift Fields filter has a single parameter called Direction Control, which allows you to manually adjust the filter. If you need to do this, use the following guidelines:

- To match a clip with upper-field dominance to a sequence with lower-field dominance, set the Direction Control parameter to +1.
- To match a clip with lower-field dominance to a sequence with upper-field dominance, set the Direction Control parameter to -1.

For example, if you add an HDV 1080i60 clip with upper-field dominance to a DV NTSC sequence with lower-field dominance, the HDV clip field dominance must be adjusted to match the sequence (this is where the Shift Fields filter comes into play—set its Direction Control parameter to +1).

The Shift Fields filter isn't necessary when editing media into sequences in which the clip and sequence field dominances match.

Xsan 1.1: Calculating Available Space

This article has been archived and is no longer updated by Apple.

With Xsan 1.1, the "Available Space," as reported by Xsan Admin, may differ from the capacity reported by the Finder or Disk Utility.

Disk Utility and the Finder both count free space that has been reserved for the SAN clients' future use, so both effectively overreport the space. Xsan Admin uses a different mechanism that more accurately states what is free in a SAN context.

Logic Pro/Express 7.1: Digidesign hardware not available message

This article has been archived and is no longer updated by Apple.

When you set Logic Pro or Logic Express 7.1 to use the Digidesign Core Audio driver, you may get an alert message that indicates the Digidesign hardware is not available.

You can work around the issue by opening the Digidesign Core Audio Manager application before you open Logic.

How to use the Xsan 1.1 Updates

This article has been archived and is no longer updated by Apple.

This article outlines the basic steps required to update Xsan to version 1.1. The steps vary according to whether your starting point is Mac OS X 10.3.9 or 10.4 "Tiger," and there are two versions of the update to accomodate that. Please note that the Xsan Migration guide, available here, contains additional scenarios and details.

Before you begin, you must decide whether you want to keep your SAN volumes available while updating the metadata controllers (MDCs), or stop the volumes during the update. If you're performing a clean install of Mac OS X or Mac OS X Server 10.4 on your MDC, you could lose your volume and SAN configuration files. To prevent this, perform an upgrade installation of Mac OS X 10.4 when applicable. **Note:** Xsan 1.1 requires 10.4.1 or later.

All MDCs should be upgraded to the same version of Mac OS X. Do not make any changes to Xsan settings using Xsan Admin or the command-line tools during the installation. Be sure that all MDCs are upgraded before you make any configuration changes.

Updating to Xsan 1.1 requires an MDC system with Mac OS X 10.3.9 or later or Mac OS X Server 10.3.9 or later. Client systems can continue running earlier versions of Xsan after you update the MDCs to Xsan 1.1. However, if any Xsan client is running Tiger (10.4), then you must update all MDCs using the Xsan 1.1 Update for 10.4.

Assuming that you have a standby MDC, you can update from Xsan 1.0 to version 1.1 on Mac OS X 10.3.9 while volumes remain available. To do this:

1. Update the operating system to Mac OS X 10.3.9 on one MDC at a time.
2. Update Xsan on one MDC at a time, using the Xsan 1.1 Update for 10.3.9.
3. Update any admin computers using the Xsan Admin 1.1 Update.
4. Optional: Return control of volumes to specific MDCs.
5. Optional: Update client computers to Mac OS X 10.3.9 and Xsan 1.1 (using the Xsan 1.1 Update for 10.3.9).

To update from Xsan 1.0 on Mac OS X 10.3 to Xsan 1.1 on Mac OS X 10.4:

1. Update all MDCs, one at a time, to Mac OS X 10.3.9.
2. Update all MDCs using the Xsan 1.1 Update for 10.3.9.
3. Upgrade all standby MDCs to Mac OS X 10.4.1, then install the Xsan 1.1 Update for 10.4.
4. Upgrade the primary MDC to Mac OS X 10.4.1, then install the Xsan 1.1 Update for 10.4.
5. Update any admin computers using the Xsan Admin 1.1 Update.
6. Optional: Fail over to the original primary MDC.
7. Optional: Update client computers. Though this is optional, it is highly recommended that clients run at least Mac OS X 10.3.9 and Xsan 1.1.

Logic Pro/Express 7.1: Key commands do not work after Tiger upgrade

This article has been archived and is no longer updated by Apple.

If you're using Logic Pro or Logic Express 7.1 and use a Scandinavian keyboard layout, you may notice that Logic key commands that incorporate modifier keys (Command, Option, and so on) do not work as expected after upgrading the computer to Mac OS X 10.4 "Tiger."

As a workaround, set the commands using the "Learn by Key Position" button instead of the "Learn by Key Label" button in the Key Commands window in Logic.

This document will be updated as more information becomes available.

Logic: WaveBurner 1.1 only writes table of contents when burning a CD

This article has been archived and is no longer updated by Apple.

In situations where WaveBurner has to bounce a project before burning a disc (such as when using fades or effects), it may only write the table of contents to the disc. The resulting disc contains no audio data.

This happens if you set WaveBurner to use outputs other than 1-2 on your audio hardware. To resolve this issue immediately, open WaveBurner preferences, click the Audio Driver tab, and choose **1-2** from the **Output** pop-up menu.

To prevent the issue in the future, update to WaveBurner 1.1.1 or later. You can download the update from Apple Downloads.

Mac OS X 10.4: Print button not responding

This article has been archived and is no longer updated by Apple.
When you try to print, the Print dialog appears, but the Print button does not respond when you click it. Additionally, the Preview button and all items under the PDF button don't respond when clicked either.

This can happen if a Xerox software plugin is installed, even if you don't have a Xerox hardware product connected.

If you have multiple printers listed in the printer list, the issue may only affect some of the printers.

If this happens, try these steps:

1. Click Cancel to dismiss the Print dialog.
2. From the Finder's **Go** menu, choose **Go to Folder**.
3. Go to this folder: /Library/Printers/PPD Plugins/
4. Remove the file "XeroxAccounting.plugin".
5. Try to print again.

Note: If you use a Xerox printer and have noticed that "Accounting" is missing from the Print dialog's pop-up menu after completing the steps above, install the latest drivers for your printer available from Xerox's web site to get the latest version of XeroxAccounting.plugin.

AirPort: Using a parallel printer with AirPort Extreme or Express

This article has been archived and is no longer updated by Apple.

If you use a USB-to-Parallel adapter cable to connect a printer to AirPort Express or AirPort Extreme, you must make the connections in this order:

1. Turn on the printer.
2. Connect the adapter cable to the printer.
3. Connect the adapter cable to the AirPort Extreme or Express.

If you need to change printers, follow the steps in reverse order to disconnect the printer.

This article does not apply to you if your printer has a USB port and a cable that is USB on both ends. **Tip:** Each end of a USB cable looks different. Learn how they look here.

AirPort Admin Utility may report incorrect IP address

This article has been archived and is no longer updated by Apple.

When using AirPort Admin Utility version 3.3 or earlier, an AirPort Extreme with firmware 5.6 or AirPort Express with firmware 6.2 may appear to have an incorrect IP address that's similar to "254.128.0.0."

The incorrect address appears in the list of base stations before you click Configure. The correct address will appear in the configuration screens.

In Mac OS X 10.3 and later, you can resolve the issue by updating to the latest AirPort software. For instructions, see "Mac OS X: Updating your software."

Users of 10.2.8 and earlier should ignore the incorrect address and click Configure to see the actual address.

Soundtrack Pro: Clip may lose take information when saved as an audio file project

This article has been archived and is no longer updated by Apple.

If you record multiple takes of a clip in a multitrack Soundtrack Pro project and then open the clip as an audio file project, you may lose the clip's take information in the multitrack project when you save the audio file project.

This issue only occurs if you convert the audio file project's channel format (for example, changing the project from stereo to mono or vice-versa) or change its sample rate. To prevent loss of takes, avoid performing these functions on multi-take clips in the Audio Wave Editor.

This document will be updated as more information becomes available.

Soundtrack Pro: Switching between multitrack projects

This article has been archived and is no longer updated by Apple.

If you have more than one Soundtrack Pro multitrack project open, you may experience a long delay after clicking a tab to switch projects before you can start working on a different one.

This happens if the projects are at different sample rates. Switching between projects that have the same sample rate is fast. In Soundtrack Pro 1.0.3 or later, choose **Soundtrack Pro > Preferences > General** and deselect the "Switch Hardware Sample Rate to match Document" setting. Although the Soundtrack Pro 1.0.3 update is recommended for all Soundtrack Pro customers, you can avoid this issue in earlier versions if you try to work in projects that use the same sample rate whenever possible, work in one project at a time, or modify a project to use the same sample rate as your other projects.

This document will be updated as more information becomes available.

Xsan 1.1: How to install on a computer that has no keyboard or monitor

This article has been archived and is no longer updated by Apple.

You can install Xsan software on a computer that has no keyboard or monitor, known as a "headless" configuration. You can specify Xsan Admin, the Xsan Filesystem, or both. Here's how to do it.

Note: Installing or upgrading to the Xsan 1.1 filesystem will require you to restart the target computer. If you're concerned about maintaining productivity throughout the update procedure, you can learn more from the Xsan Migration Guide.

1. Log in to a computer on the network that has a monitor and keyboard. If you are installing from an Xsan Install CD, insert the Xsan installation disc in this computer. If you are updating Xsan 1.0 or 1.0.1 using the downloadable upgrade packages, you can download the correct packages here:

   Xsan Update 1.1 for 10.4
   Xsan 1.1 Update for 10.3.9
   Xsan Admin 1.1 Update (10.3.9 or 10.4.1)

   Once the update package has been downloaded, open the disk image.

2. Open the Terminal (/Applications/Utilities).
3. Execute one of the following Terminal commands, according to your installation preference, to copy the desired packages from the installation disc or updater disk image to the target computer. When doing so, replace <user> with a user name of an administrator of the target computer, and replace <remotehost> with the IP address or DNS name of the target computer.

   To copy both Xsan Admin and the Xsan Filesystem to either a 10.3.9 or 10.4.1 or later target computer, enter this:

   ```
   $ scp -r /Volumes/Xsan/Install_xsan.mpkg <user>@<remotehost>:/tmp/
   ```

   To copy Xsan Admin only from the installation disk, enter:

   ```
   $ scp -r /Volumes/Xsan/Admin Tools.localized/XsanAdmin.pkg <user>@<remotehost>:/tmp/
   ```

   To copy the Xsan Filesystem only from the installation disk to a 10.3.9 target computer, enter:

   ```
   $ scp -r /Volumes/Xsan/Install Xsan.mpkg/Contents/Installers/XsanPanther.pkg <user>@<remotehost>:/tmp/
   ```

   To copy the Xsan Filesystem only from the installation disk to a 10.4.1 or later target computer, enter:

   ```
   $ scp -r /Volumes/Xsan/Install Xsan.mpkg/Contents/Installers/XsanTiger.pkg <user>@<remotehost>:/tmp/
   ```

   To copy Xsan Admin only from the updater disk image, enter:

   ```
   $ scp -r /Volumes/Xsan\\ Admin\\ Update\\ 1.1/XsanAdmin.pkg/ <user>@<remotehost>:/tmp/
   ```

   To copy the Xsan Filesystem only from the updater disk image to a 10.3.9 target computer, enter:

   ```
   $ scp -r /Volumes/Xsan\\ File\\ System\\ Update\\ 1.1/XsanPanther.pkg/ <user>@<remotehost>:/tmp/
   ```

   To copy the Xsan Filesystem only from the updater disk image to a 10.4.1 or later target computer, enter:

   ```
   $ scp -r /Volumes/Xsan\\ File\\ System\\ Update\\ 1.1/XsanTiger.pkg/ <user>@<remotehost>:/tmp/
   ```

4. Log in to the remote computer by typing:

   ```
   $ ssh <user>@<remotehost>
   ```

5. Run the installer on the headless computer by entering the following command, replacing <packageName> with the name of the package you copied over in step 3 (Install_xsan.mpkg, XsanAdmin.pkg, XsanPanther.pkg, or XsanTiger.pkg). The verbose parameter is optional, but including it will allow you to see the installation's progress.

   ```
   $ sudo installer -verbose -pkg /tmp/<packageName> -target /
   ```

6. After the installation is complete, execute the command:

```
$ sudo restart
```

Soundtrack Pro: Audio may stutter when scrubbing H.264 files

This article has been archived and is no longer updated by Apple.

If you're working with H.264 video files in a Soundtrack Pro project, you may come across a situation where the audio stutters when you scrub the playhead.

This can happen if your available hard drive or CPU bandwidth is insufficient. As a workaround, try moving the video file to a faster hard drive. Hiding the video tab may also improve audio performance when scrubbing files.

(For instructions on hiding the video tab or other "how to" questions, see the Soundtrack Pro manual, available from the Help menu.)

Final Cut Pro 5: How to make the Timeline span across multiple displays

This article has been archived and is no longer updated by Apple.

In Final Cut Pro, you can arrange its windows any number of ways, allowing you to choose a configuration that best suits your needs. If you have more than one display connected to your computer, you can arrange Final Cut Pro windows across multiple displays.

However, in Final Cut Pro 5 it may seem difficult to get the Timeline to span the displays—when you try to resize the Timeline across the displays the common way, by dragging the window's lower-right corner, it may snap to conform to the edges of only one display.

Instead, try dragging the edges of the window to resize it rather than dragging the lower-right corner. You can reposition the entire window by dragging from the title bar, and then resize it by dragging its edges, not its corner.

This document will be updated as more information becomes available.

iSync 2.0: Data may disappear from Symbian OS phone after syncing

This article has been archived and is no longer updated by Apple.

If you have a Symbian OS-based phone and try to sync it with your Mac shortly after changing some information on the phone, the recently entered or modified data may disappear from the phone and won't be synced to the computer. This can happen if you're using iSync 2.0 (included with Mac OS X 10.4 Tiger).

To avoid this issue, wait 1 or 2 minutes before syncing if you recently added or modified contacts, calendars, or to-do items on the phone. After waiting, you should be able to sync normally.

Logic Pro/Express 7: Pitchbend events sound late with Quicktime Synth

This article has been archived and is no longer updated by Apple.

When you assign MIDI tracks to play back through the internal QuickTime Synth object in Logic Pro or Logic Express 7, the pitchbend events will sound late.

You can avoid this issue by routing your MIDI data to the DLS MusicDevice synthesizer instead of to the internal QuickTime Synth object. If you're using the QuickTime Synth, your setup probably looks like this:

To route MIDI to the DLS MusicDevice, insert the DLS MusicDevice instrument into an Audio Instrument channel by clicking the channel's input slot and choosing **Stereo > AU Instruments > Apple > DLS MusicDevice** from the pop-up menu. Grab the cable from the Multi Instrument that's currently connected to the QuickTime Synth object and connect it to the Audio Instrument.

This document will be updated as more information becomes available.

Language Kits: Compatibility & Installation

This article contains frequently asked questions (FAQ) regarding Language Kit compatibility and installation, with answers to those questions. This article has been archived and is no longer updated by Apple.

Questions answered in this article:

1. Is WorldScript incompatible with Finder Hiding, a feature on the Performa Operating System and System 7.5.x?
2. I am attempting to install the Chinese Language Kit (CLK) under System 7.5.x. I have the updater for the CLK, but cannot get the Language Kit itself installed because I get an error that the system cannot be updated. What's happening?
3. Is there a version of the Japanese Language Kit (JLK) compatible with Mac OS 7.6?
4. How do I install the Chinese Language Kit on a PCI-based Power Macintosh?
5. Is the Chinese Language Kit compatible with Mac OS 7.6 and Mac OS 7.6.1?
6. I want to install multiple Language Kits on my system. In what order should I install them?

Question 1: Is WorldScript incompatible with Finder Hiding, a feature on the Performa Operating System and System 7.5.x?

Answer: Finder Hiding occurs when you launch (double-click) an application in the Finder. All of the Finder's windows and icons are hidden while the application is running. Quitting the application restores the Finder view of icons and windows.

The WorldScript extension, included with Apple's Chinese Language Kit (CLK) and the Japanese Language Kit (JLK), is incompatible with Finder Hiding, a feature of the System 7.01P and System 7.1P and System 7.5.x.

To determine the fix for this incompatibility, first find out what version of system software you are using. Choose the "About This Computer" menu item from the Apple menu. The window which opens will state the System version number.

For System 7.1P2, 7.1P1, and 7.0.1P users:

If you have Performa System Software 7.1P2 or earlier, remove the Launcher from the Control Panels folder and restart your Performa. With System Software version 7.1P2, the Launcher control panel controls the "Finder Hiding" feature.

To remove the Launcher control panel:

1. Choose the Control Panels folder from the Apple menu.
2. Drag the Launcher control panel out of the Control Panels folder.
3. Close the Control Panels folder by clicking the close box.
4. Choose Restart from the Special menu to restart your Performa.

For System 7.1P5 and 7.1P3 users:

1. Choose the Control Panels folder from the Apple menu.
2. Double click on the Performa control panel to open it.
3. Click the check box marked Finder Hiding once to turn the feature off.
4. Close the Performa control panel by clicking the close box.

For System 7.5.x users:

1. Choose the Control Panels folder from the Apple menu.
2. Double click on the General Controls control panel to open it.
3. Make sure there is an X next to Show Desktop when in background.
4. Close the General Controls control panel by clicking the close box.

Question 2: I am attempting to install the Chinese Language Kit (CLK) under System 7.5.x. I have the updater for the CLK, but cannot get the Language Kit itself installed because I get an error that the system cannot be updated. What's happening?

Answer: To Install the Chinese Language Kit 1.0 under System 7.5.x, you must remove the Launcher from the Control Panels folder. This will allow the installation to take place. However, you will need the Chinese Language Kit Update 1.1.1, to be compatible with System 7.5.x.

Question 3: Is there a version of the Japanese Language Kit (JLK) compatible with Mac OS 7.6?

Answer: Japanese Language Kit 1.2 is required for (and is compatible with) all 7.5 and higher systems.

Question 4: How do I install the Chinese Language Kit on a PCI-based Power Macintosh?

Answer: To use the Chinese Language Kit with a PCI-based Power Macintosh, you MUST install in the following order:

1. Install the WorldScript Updater 1.0 or later, or WorldScript Pieces Install. One of these installers will be located in the CD Extras folder of the System Software CD that came with your PCI-based Power Macintosh computer.

2. Install the Chinese Language Kit version 1.0 or 1.1.

3. Install the Chinese Language Kit Updater to update your software to version 1.1.1.

If this installation order is not followed it will result in your Power Macintosh booting to a flashing "?" and you will need to clean install your system software and install the Language Kit components in the correct order.

Question 5: Is the Chinese Language Kit compatible with Mac OS 7.6 and Mac OS 7.6.1?

Answer: The Chinese Language Kit is compatible with Mac OS 7.6 and Mac OS 7.6.1. See article 30009: "**Apple Asia Chinese Language Kit: Questions and Answers**" for installation instructions.

Question 6: I want to install multiple Language Kits on my system. In what order should I install them?

Answer: If you are installing multiple Language Kits on your system, install them in order from oldest to newest.

If you were to install all of the language kits currently available, you would do so in the following order:

- Chinese Language Kit 1.1.1
- Japanese Language Kit 1.2
- Cyrillic Language Kit 1.0
- Arabic Language Kit 1.0.1
- Hebrew Language Kit 1.0.1
- Korean Language Kit 1.0
- Indian Language Kit 1.0.

Logic Pro 7 or later: Dialog asking to locate IR files keeps appearing

This article has been archived and is no longer updated by Apple.

After upgrading to Logic Pro 7 or later, you may get messages that ask you to locate IR files when you open a Logic 6-created song that contains instances of Space Designer. Despite asking you for the location, the navigation dialog used to locate the file (or files) will default to the correct location for the file in question.

This happens because the default location for IR files has changed with Logic Pro 7. A complete set is installed at /Library/Application Support/Logic/Impulse Responses. Songs with Space Designer instances that refer to the old default location (/Applications/Logic/Impulse Responses) will exhibit this issue.

You can resolve the issue by selecting the same IR file from the new location for each instance of Space Designer and then saving the song.

This document will be updated as more information becomes available.

Logic Pro 7: VSM turns off if audio driver is disabled

This article has been archived and is no longer updated by Apple.

Under certain circumstances, the Virtual Sample Memory (VSM) feature of the EXS24 sampler in Logic Pro 7 may turn itself off. As a result, songs may use more RAM than what's available.

This happens if you disable the audio hardware driver in the Audio Drivers preferences window and then relaunch Logic Pro. If you swap one audio driver for another, VSM will remain on. Only starting Logic without an audio driver enabled will cause this issue to happen.

This document will be updated as more information becomes available.

Logic Pro/Express: "Auto create tracks" and "Auto mute" options are always on when cycling audio

This article has been archived and is no longer updated by Apple.

When you record audio in cycle mode in Logic Pro or Logic Express, Logic mutes all previous takes and creates new tracks for each cycle iteration—even when the "Auto mute in cycle record" and "Auto create tracks in cycle record" options are not enabled.

These two settings only apply to MIDI regions, which can be stacked on a track so that all takes play together (as long as the receiving module or Audio Instrument has sufficient polyphony to play all the notes).

Audio regions can't be stacked in the same way, since only one audio region can play at any given point on an audio channel. Because of this, Logic always creates new tracks when recording audio in cycle mode, and mutes regions created from previous iterations to ensure that the current recording is always audible. You may then selectively unmute regions from previous cycle iterations.

Logic Pro/Express 7.1: Last node remains selected when creating four nodes with the Automation tool

This article has been archived and is no longer updated by Apple.

In Logic Pro or Logic Express 7.1, if you create four automation nodes by Control-Option-Shift dragging with the Automation tool over a selected area, the second, third, and fourth nodes will appear highlighted. However, only the second and third nodes should be highlighted.

This issue is resolved in Logic Pro and Express version 7.1.1 or later, available at Apple Downloads. The description below remains for 7.1 users who don't have time to update immediately.

Here's a picture of what the four nodes look like when you first create them:

Because the fourth node is highlighted along with the second and third, this makes it difficult to adjust only the automation within the area you selected. If you drag the selected set of nodes, you'll also affect automation to the right of the intended area. Here's what this looks like:

To work around this issue, click on the background of the Arrange window to deselect all nodes and then drag the line that connects the second and third nodes.

GarageBand 2: Recordings made with iSight and some USB mics are too high pitched

This article has been archived and is no longer updated by Apple.

When you use iSight or a USB microphone to record audio in GarageBand 2, you may get recordings that sound too high pitched and play back too fast.

This issue only occurs on Mac mini computers. GarageBand only supports audio interfaces that operate at 44.1 kHz. The iSight only operates at 48 kHz. On most Macintosh computers, you can't select iSight as an audio input source in GarageBand—the choice will appear dimmed with the words, "not 44.1."

Because the Mac mini has no built-in audio input source, if you connect an iSight to it and open GarageBand, GarageBand will automatically default to selecting the device, even though the iSight selection will still remain dimmed and say "not 44.1."

When you record form iSight and then play it back, your 48 kHz file gets played back at 44.1 kHz, causing the speed and pitch discrepancy. To record audio on a Mac mini, you should use an audio interface that supports 44.1 kHz operation.

This document will be updated as more information becomes available.

iDVD 5, DVD Studio Pro: Widescreen DVD content may not display correctly on some DVD players

This article has been archived and is no longer updated by Apple.

You can create 16:9 widescreen DVDs in both DVD Studio Pro and iDVD 5. On a widescreen television, the video image will fill the entire 16:9 screen. If you play a widescreen DVD on a player connected to a standard 4:3 TV, the widescreen image should be presented "letterboxed," with black bars appearing above and below the width of the image to preserve the aspect ratio. However, some DVD players may not display widescreen DVDs (created in DVD Studio Pro or iDVD 5) in the correct letterbox presentation on a 4:3 TV or monitor.

If this happens to you, verify your DVD player setup. If the player is set to output video to a 16:9 monitor, letterboxing will not occur on 4:3 monitors. If you can, change the player's output for a 4:3 monitor so that it letterboxes correctly.

Note: Some players will still not present widescreen video with the correct letterbox presentation on a 4:3 TV or monitor. Additionally, menus burned from iDVD 5 are always 4:3 - the issue described above only concerns the widescreen content part of the DVD playing back as "stretched" on a 4:3 TV.

iMovie HD: Emptying iMovie Trash may not recover the expected amount of disk space

This article has been archived and is no longer updated by Apple.

You may notice in iMovie HD that, after emptying the Trash, the disposal of clips did not appear to increase the amount of free disk space available to you. This can happen if you split a clip in the timeline and then move one of the split clips to the iMovie Trash.

As iMovie HD features non-destructive editing, this is normal behavior. Non-destructive editing means that the video clips you see and work with in the program are merely representations of the video files that reside on your hard drive and that you can modify these representations and not affect your originals. Non-destructive editing makes it easier to undo or alter previous changes without having to reimport video from your original source.

When you split a clip into sections, iMovie HD doesn't really split the actual file that resides on your hard disk—rather, it creates references to the original clip's footage and these references are what you are editing. The entire original video clip remains on the disk for usage until all references to it have been deleted from iMovie HD's timeline and Clips pane.

This means that until you move all the references that point to the original clip to the iMovie Trash, you won't be able to recover the expected amount of space because other items may be relying on this clip. By themselves, references don't take up significant space to recover the amount indicated by the iMovie Trash when deleting these items individually.

Logic Pro/Express: Digital input not available

This article has been archived and is no longer updated by Apple.

Logic Pro and Logic Express cannot access the digital input on certain computers. The affected systems will list the digital input as a separate device in Audio MIDI Setup. To check your system, follow these steps:

1. Open Audio MIDI Setup (located in /Applications/Utilities).
2. Click the Audio Devices tab.
3. Open the **Default Input** pop-up menu.

If your system shows more than one built-in input source, it will be affected by this issue.

Logic cannot access devices that offer only an input, and therefore cannot use the digital input. On systems with Mac OS X 10.4 or later, you can work around the issue by creating an aggregate device that uses the I/O from both available audio devices on your system.

To create an aggregate device in Audio MIDI Setup:

1. From the **Audio** menu, choose **Open Aggregate Device Editor**.
2. Click the plus (+) button to the left of "Add and remove aggregate devices on your computer."
3. In the bottom panel, select the checkbox in the Use column for each device.
4. Click Done.

5. In the Audio MIDI Setup, under Properties For: Built-in Audio, click Clock Source.
6. Select External

In Logic, you can now open the Audio Drivers window (**Audio > Audio Drivers**), click the Core Audio tab, and choose the new aggregate device.

Soundtrack Pro: Can‘t reset the Match EQ template spectrum

This article has been archived and is no longer updated by Apple.

Once you set a template spectrum for the Match EQ plug-in in Soundtrack Pro, you won't be able to clear it and then choose a different template spectrum. This happens when you're using Match EQ in an audio file project and have already chosen a template spectrum but wish to clear it and choose a different one.

If you Control-click the Learn button under Template and choose **Clear Template Spectrum** from the shortcut menu, the function seems to work, but when you select a different audio file by choosing **Generate Template Spectrum from audio file...**, the waveform for the original file appears again.

To resolve this issue, remove the Match EQ plug-in from the project and then reinsert it. If you haven't yet applied Match EQ to the project, simply pressing the Cancel button should work. You should now be able to choose a new audio file as a template.

This document will be updated as more information becomes available.

Mac OS X 10.3 and later: Keychain Scripting "isn‘t running" error in AppleScript scripts

This article has been archived and is no longer updated by Apple.

Some AppleScript scripts that use Keychain Scripting may produce this error message:

> "Keychain Scripting got an error: Application isn't running."

To resolve the issue, make sure that the Keychain Scripting process is already running; it should be launched by a process other than the one that wants to run the script.

One method for doing this is demonstrated in the following AppleScript:

-- Begin Script

```
property pKeychainItemName : "kctest"

on startKeychainScripting()

 -- This function ensures that the Keychain Scripting.app is launched by a process
 -- different from the one executing this script. It is only needed when using Keychain Scripting to
 -- retrieve the password property of a key.

 -- Quit Keychain Scripting if it's running, since opening this script may have implicitly launched it.
 try
  tell application "System Events"
   set foundApp to first process whose name is "Keychain Scripting"
   set pid to id of foundApp -- this will exit the try block if the process isn't running
   quit foundApp -- we get here if the process is found
  end tell
 end try

 -- get Finder to launch Keychain Scripting
 tell application "Finder"
  open application file ((startup disk as string) & "System:Library:ScriptingAdditions:Keychain Scripting") as alias
 end tell

 -- make sure that Keychain Scripting is up and running
 repeat while true
  try
   tell application "System Events"
    set foundApp to first process whose name is "Keychain Scripting"
    set pid to id of foundApp -- this will exit the try block if the process isn't running
   end tell
   exit repeat -- we get here if the process is found
  end try
 end repeat

end startKeychainScripting

on run
 set x to my getPassword(pKeychainItemName)
 activate
 display dialog x buttons {"OK"} default button "OK"
end run

on getPassword(keyname)

 startKeychainScripting()

 tell application "Keychain Scripting"
  try
   set theKey to first key of current keychain whose name is keyname
   set thePassword to password of theKey
  on error message number errNum
   set thePassword to message & " (" & errNum & ")"
  end try
 end tell

 return thePassword

end getPassword
```

-- End Script

This document will be updated as more information becomes available.

Shake 4: Using Shake 3 projects that contain Rotoshapes

This article has been archived and is no longer updated by Apple.

Shake 4 modifies the way the Rotoshape node works. As a result, rotoshapes created and rendered in Shake 3.5 could potentially yield slightly different results when rendered in Shake 4. This difference is more prominent in shapes with hard edges, though any potential difference is minimal (a 3-pixel shift along one edge, maybe) and should generally not be an issue.

To avoid potential issues, keep the following in mind:

1. Never mix rotoshape-heavy rendered frames from Shake 4 and Shake 3.5 (for example, frame 1 was rendered in Shake 3.5, frame 2 was rendered in Shake 4, and so on).
2. If you have a script with rotoshapes that were created in Shake 3.5, but are to be rendered (or further worked on) in Shake 4, double-check the accuracy of your shapes—particularly if those shapes have hard edges or are very tightly fitted to the rotoshaped image.

Logic Pro/Express: Inserting a voice into a Score Style adds unwanted stave

This article has been archived and is no longer updated by Apple.

If you copy one of the preset Score Styles in Logic Pro or Logic Express and then try to add a voice to an existing stave by choosing **New> Insert Voice**, Logic creates a new stave for the voice instead of adding the voice to an existing one.

When you open a Score Style in the edit window, the insert mark's default location appears above the first existing voice, as shown below.

When you insert a new voice, it gets placed at the position indicated by the insert mark. In the case of a Score Style, this would be before the first voice. Because a voice cannot exist without a stave, Logic creates a new stave for the voice, as shown below.

To workaround this issue, before inserting a new voice, grab the insert marker in the edit window and drag it down so that it appears below the existing voice, like this:

Now when you choose **New> Insert Voice** in the Score Style window, the voice will be added to the existing stave.

iPod: Previous and Next buttons now go to chapters in an audiobook or podcast

This article has been archived and is no longer updated by Apple.

Starting with iPod Updater 2005-6-26, the behavior for the Previous and Next buttons on an iPod with a Click Wheel has changed slightly. If you have a track that contains chapter marks, such as an audiobook or podcast, pressing Previous or Next will go to the previous or next chapter within the track, respectively. Prior to this update, these buttons would go to the previous or next track.

This can cause confusion in some cases, such as if you have an audiobook that contains a lot of chapter marks. Alternatively, you can scroll the Click Wheel to navigate between tracks with many chapter marks.

If you're not sure what iPod you have or if it has a Click Wheel or not, see this document.

ClarisWorks 4.0v5: Saving On 4GB Or Greater Volumes Issue

ClarisWorks 4.0v5 users receive a "Disk Full" error when attempting to save a file or library to a server volume with 2GB or more.

This document provides information about:

I. Installing the ClarisWorks 4.0v6 update
II. Issues addressed in v6
III. Issues addressed in previous releases
IV. New features
This article has been archived and is no longer updated by Apple.
This issue has been corrected in ClarisWorks 4.0v6. An updater can be downloaded from Apple Software Updates online.

I. Installing The ClarisWorks 4.0V6 Update:
Before running the updater make sure all of your computer's System software extensions are turned off. To do this:

1. Save all open files and quit all of the programs running on your computer.
2. Hold down the Shift key on your keyboard.
3. Choose Restart from the Special menu.
4. Do not release the Shift key until the words "Welcome to Macintosh. Extensions off." appear on your screen.

To update the ClarisWorks 4.0v5 product currently installed on your computer:

1. Double-click the "ClarisWorks 4.0v6 Updater" installer icon.
2. Read the Claris splash screen and click Ok.
3. The ClarisWorks 4.0v6 updater will automatically search your hard disk (and any mounted volumes) and display a list of eligible files for updating. Note: Only ClarisWorks 4.0v5 may be updated using this updater. Earlier versions of ClarisWorks 4.0 must first be updated to 4.0v5. 4. Click Update. The updater will begin updating the selected application. Once the updater is finished, you have the option of deleting the original 4.0v5 file. Then click Ok to quit and you can begin using the updated version of ClarisWorks.

II. ISSUES ADDRESSED IN V6
This v6 Updater addresses one issue from previous versions:

When attempting to save a file or library to a server volume with 2Gb or more free space, a "Disk is full." error would result.

III. ISSUES ADDRESSED IN PREVIOUS RELEASES

- Closing documents: In v4 and earlier versions, on Macintoshes with more than 48 MB of available system RAM, closing a ClarisWorks document would cause a crash on some computers.
- Importing Excel documents: In v4 and earlier versions, calculations in Excel spreadsheets that contained numbers greater than 32767 imported as negative numbers in ClarisWorks. This was fixed in the latest version of the Excel translator provided with this update. Several stationery files have been updated to use 1997 dates where appropriate.
- Mail Merge and Multiple Line Data: In v4, when a mail merge field contains multiple lines of text, the text now merges and prints correctly. (The text still displays as a single line on the screen.)
- Mail Merge and Sliding over Empty Fields: In v4, when there is an empty mail merge field on a line by itself, the following text moves up appropriately and prints correctly. (The text does not "slide" on the screen.)
- Rotating Library Images: In v1, some of the ReadyArt library images didn't rotate correctly. This was fixed in v4.
- Stationery Corrections: Minor changes were made to some of the stationery files.
- Address List Assistant: Minor changes were made to the Address List Assistant for better printing and on-screen display.
- New AppleWorks DB/SS and RTF filters:
- Faster Word Count:
- Option left/right arrows: In WP now correctly skips carriage returns and tabs (as it did in versions prior to 4.0).
- New Document dialog: Now displays more quickly, especially when there are many stationery files in the ClarisWorks Stationery folder.
- Word Services AppleEvent Support: In v4, it is easier to use applications that support the Word Services AppleEvent standard (such as some third party spelling or grammar checkers).

To enable the Word Services command in the Edit:Writing Tools menu of the ClarisWorks word processor:

1. Select Preferences from the Edit menu.
2. Select the Text icon.

3. Check the Word Services checkbox under General and click OK.

To select a Word Services application for use with ClarisWorks:

1. Open or create a word processing document.
2. Select Writing Tools from the Edit menu and then select Edit Word Services. You see a dialog containing a list of all the Word Services applications for which ClarisWorks is currently configured.
3. Press the Add button.
4. You see a dialog listing the applications running on your Macintosh that use Word Services AppleEvent standard.
5. Select the one you want and click OK.
6. In the Word Services dialog, click OK.
7. A new menu item corresponding to the Word Services application you chose appears in the Writing Tools menu.

You can also use the Edit Word Services dialog to remove installed Word Services applications from the Writing Tools menu.

To use a Word Services application on a ClarisWorks word processing document, choose the appropriate menu item from the Writing Tools menu. This launches the Word Services application if is not already running. If you have text selected in the document, then the Word Services application checks the selection. Otherwise, the entire document is checked.

IV. NEW FEATURES (Prior versions - No New Features in 4.0v6)
Release 4.0v4 added several new features, including:

- New picture and layout in the ClarisWorks splash screen.
- Macintosh Drag and Drop Support: Users can use Macintosh Drag and Drop (that comes with System 7.5) to move text, graphic objects, and spreadsheet cells within ClarisWorks 4.0 documents, drag selections from one document to another, drag selections to other applications (including creating clipping files in the Finder).
- Backwards File Conversion to 2.0/2.1/3.0 Formats: You can use the new ClarisWorks File Converter application to save version 4.0 files in the format used by ClarisWorks versions 2.0, 2.1 and 3.0. For more on the File Converter, see the file "Read Me - CW File Converter".
- New filter for WordPerfect 3.1 for Macintosh.

Note: There is no 4.0v6 updater for any language besides US-English. For all locales, this issue is resolved in version 5.0.

iTunes: Exclamation point appears next to podcast

This article has been archived and is no longer updated by Apple.

If you have podcasts in iTunes, an exclamation point may appear to the left of a podcast or podcast episode in certain circumstances.

This can happen for several reasons:

- iTunes can't locate the podcast episode. You may have inadvertently moved or deleted it. If you can't locate the podcast episode, you may want to download it again.
- There is a problem downloading the podcast. You can click on the exclamation point to learn more information.
- You've subscribed to a podcast but have more than five unplayed episodes. iTunes will stop automatically downloading newer episodes. You may get the following message:

  > iTunes has stopped updating this podcast because you have not listened to any episodes recently. Would you like to resume updating this podcast?

  You can click Yes to continue downloading additional episodes. Or you can just listen to any part of any episode and a new episode will download at the next update.

Note that with iTunes 4.9, you cannot edit a podcast address. If you typed the address in manually (as opposed to subscribing from the iTunes Store), you will need to delete the podcast subscription and resubscribe with a valid address.

Published Date: Oct 7, 2016

iPod: About screen may include podcasts in the total number of songs.

This article has been archived and is no longer updated by Apple.

Depending on which iPod model you have and what firmware version is installed, the About screen (choose **Settings** > **About** on iPod) will include the following audio types in its total number of songs:

iPod model	**About menu includes**
iPod with Click Wheel (not upgraded to the latest firmware)	Songs, audiobooks, and podcasts
iPod with Click Wheel (upgraded to the latest firmware)	Songs and audiobooks, but not podcasts (unless podcast or episode is dragged into the music library)
iPod without Click Wheel	Songs, audiobooks, and podcasts

If you're not sure what iPod model you have or if it has a Click Wheel, click here to help identify your iPod model.

iDVD 5: Audio encoding error when burning a DVD

This article has been archived and is no longer updated by Apple.

You may get an audio encoding error message when you try to burn a DVD in iDVD 5 that contains an iMovie HD project without any audio (such as an iMovie project that contains only still images). The burn process will stop and you'll see one of the following alerts:

> "Encoding Audio. Error during rendering/encoding: Audio_<project name> -1"
>
> or
>
> "Error during rendering/encoding"

To resolve this issue, open your iMovie project in iMovie and add a short audio track anywhere in the timeline. You can even create a blank audio track by recording from an audio input source that doesn't have any active audio (such as recording from your computer's audio Line In without connecting a microphone). The audio track doesn't have to be long or have audible content—it just needs to be part of the project.

Once you save the iMovie project, you can go back to iDVD to burn it.

Tip: If the burn fails in this manner, it's likely your DVD media remains untouched and can be reused.

QuickTime Pro: About the Play All Frames feature

This article has been archived and is no longer updated by Apple.

When you upgrade to QuickTime Pro, "Play All Frames" is one of the features that becomes active in QuickTime Player—to enable the option, choose **Play All Frames** from the **View** menu (or **Movie** menu in QuickTime 6) to place a check mark by it.

This feature may play movies back differently than if you just click the Play button in QuickTime Player.

When you click the Play button, QuickTime Player automatically adjusts the video performance to provide the best possible presentation on your particular computer. If a movie is supposed to be exactly one minute long, QuickTime Player will make sure that the movie plays for exactly 60 seconds.

This can be a tough job if the movie was made on a fast computer and then played back on a slower computer that might not handle video as well. On a slower computer, QuickTime Player will skip frames to keep up with the time constraint if the movie contains more frames per second than it can handle.

The "Play All Frames" feature takes a different approach to performance. Instead of trying to keep up with the time, QuickTime Player will play every frame of the movie, without regard to how long it takes, when the feature is enabled.

Note: When you choose to play all frames in a movie, the audio track will not play.

iDVD 5: Previous themes are missing

This article has been archived and is no longer updated by Apple.

When you install Mac OS X 10.4 and the bundled Apple applications from the discs included with new Apple computers, some themes may not show up in iDVD 5. This issue can occur with the following products and bundled software that ships with some iMac and eMac computers:

- iDVD 5.x
- Mac OS X 10.4.1 Installer disc and bundled applications
- 17-inch iMac computers
- 20-inch iMac computers
- eMac computers

To find out if this issue affects you, open iDVD 5, click the Customize button, click the Themes tab, and then open the **Themes** pop-up menu.

You should see category choices for iDVD "5.0 Themes," "4.0 Themes," and "Old Themes." If the only menu item available is "5.0 Themes," you will need to install the older themes if you want to use them.

To install the missing themes, do the following:

1. Drag the iDVDThemes.pkg file located in /Library/Receipts to the Trash.
2. Insert the Mac OS X Install Disc 2 disc that was included with your computer.
3. From the **Go** menu, choose **Go to Folder**.
4. Type `/Volumes/Mac OS X Install Disc 2/Packages/` in the field and click Go.
5. Double-click the iDVD Themes.pkg installer.
6. Follow the steps to upgrade.

If you don't have one of the above computers that came with Mac OS X 10.4.1, but think you may have a related issue, then see "iDVD 4/5: Where are the older themes?" for more information.

This document will be updated as more information becomes available.

iWork ‘05: Can‘t enter serial number

This article has been archived and is no longer updated by Apple.

Not all iWork '05 serial numbers will work with Pages 1.0 and Keynote 2.0. If you're having difficulty entering your serial number, updating the software may help.

The first time you open Keynote or Pages, you are prompted to enter a serial number. The screen should also contain a "Buy Now" button. If this button isn't present, you may need to update your software before you can enter your serial number.

You can update Keynote and Pages to the latest versions through Software Update, or download the updates from these web locations:

- Keynote update
- Pages update

This should not occur if you are upgrading from a trial version of iWork.

About Soundtrack Pro 1.0.1 and Final Cut Pro

This article has been archived and is no longer updated by Apple.

If you experience any of the following issues when working with Final Cut Pro and Soundtrack Pro, then update to Soundtrack Pro 1.0.1 using Software Update.

The In and Out points for subclips sent from Final Cut Pro to the Waveform Editor in Soundtrack Pro may get shifted.

In Final Cut Pro, you can create a subclip and give it different In and Out points than the source clip from which it was created. When you send a subclip from Final Cut Pro to the Soundtrack Pro Waveform Editor, the clip appears with gray markers that indicate the In and Out points. However, these points might not appear in the right positions, although the distance between them is correct.

When you send a subclip to a multitrack project in Soundtrack Pro 1.0.1 or later, the In and Out points appear at the correct positions.

A stereo audio clip in a Final Cut Pro sequence may create two reference movies when sent to the Final Cut Pro Timeline

This can happen when you send a Final Cut Pro sequence to the Timeline that contains a stereo audio clip (an AIFF file or a QuickTime movie) that meets one of the following conditions:

- The clip is located on a pair of audio tracks where the left channel is on an even-numbered track and the right channel is on an odd-numbered track.
- The clip is unlinked.
- The clip is linked but not stereo linked, and the channels are offset from one another.

In all of these cases, Soundtrack Pro 1.0.1 and later creates two reference movies; one for each Final Cut Pro audio track.

Working with background movies in Soundtrack Pro

Background movies are now properly sent to Soundtrack Pro when you export to a Soundtrack Pro multitrack project from Final Cut Pro.

Sending audio file projects from Final Cut Pro to Soundtrack Pro

You can now send Soundtrack Pro audio file projects from the Final Cut Pro Timeline to Soundtrack Pro multiple times.

In Final Cut Pro 5.0.2, when you send an audio clip in the Final Cut Pro Timeline to a Soundtrack Pro audio project, the resulting Soundtrack Pro audio project clip in the Final Cut ProTimeline will no longer be linked to its corresponding video clip in the video track. If you need to link a video clip and a Soundtrack Pro project clip in the Timeline, you can manually link them by selecting the relevant clips, then choosing **Modify** > **Link** in Final Cut Pro 5.0.2 or later

About Pro Application Update 2005-01

This article has been archived and is no longer updated by Apple.

Pro Application Update 2005-01 addresses several issues with underlying frameworks and shared components for Apple's professional applications, and is strongly recommended for all users of Final Cut Studio, Final Cut Pro 5, Motion 2, Soundtrack Pro, DVD Studio Pro 4, Shake 4, LiveType 2, Compressor 2, and Apple Qmaster 2.

This update is also recommended for users who have previously installed the FxPlug SDK.

Component name	Applications	Description
LiveType Support 2.0.2	LiveType 2 Final Cut Pro 5 Final Cut Studio PluginManger FxPlug Motion 2 DVD Studio Pro 4	Addresses an issue with LiveType 2 project integration with Final Cut Pro 5, Motion 2, and DVD Studio Pro 4.
FxPlug.framework	Motion 2 Final Cut Studio LiveType PluginManger FxPlug	Addresses issues with using third-party Core Image Units in Motion 2.
PluginManager.framework	Motion 2 Final Cut Studio LiveType PluginManger FxPlug	Addresses incompatibilities with running Motion 1.0 and Motion 2.0 on the same hard drive partition.
Apple Uncompressed 422 Codec	Final Cut Studio Final Cut Pro Motion 2 Soundtrack Pro DVD Studio Pro Compressor 2 Apple QMaster 2	The update addresses corruption issues in Shake 3.5 and Shake 4.0 when working with 10-bit QuickTime files.
Helium 2.0.1	All	The update was provided in conjunction with the Shake 4.0 release, and is being released for all pro applications that leverage the framework for version syncing.
DVCPROHD Codec	All	The DVCPro HD codec removes artifacts that can be introduced by applying the Advanced format conversion DVCPro HD 1080i60 setting to a source movie.

Mac OS X 10.4: Use Gimp-Print driver with Lexmark Z53

This article has been archived and is no longer updated by Apple.

If you're printing to a Lexmark Z53 printer using the Lexmark driver included with Tiger, and the print queue stops without printing, try using the Gimp-Print driver instead. Here's how to switch the printer driver.

1. From the **Apple** menu, choose **System Preferences**.
2. Click Print & Fax to display its preference pane.
3. Click the Printing tab.
4. Remove your current Lexmark Z53 printer by selecting it in the pane, then clicking the minus sign (-) button.
5. Click the plus sign (+) button to open Printer Setup Utility.
6. Select "Lexmark Z53" in the Printer Browser window.
7. From the **Print Using** pop-up menu, choose **Lexmark**.
8. In the Model list that appears below it, select "Lexmark Z53 - Gimp-Print v5.0.0-beta2."

   Tip: If "Lexmark Z53 - Gimp-Print v5.0.0-beta2" does not appear in the list of Lexmark printer models, use Optional Installs to install Gimp Printer Drivers.

9. Click Add.

Note: The Gimp-Print driver should provide basic printing functions for the printer, but not all features may be available.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

iBook G4, Aluminum PowerBook G4: Preparing your computer for mail-in repair

This article has been archived and is no longer updated by Apple.

When you get ready to send in your iBook G4 or Aluminum PowerBook G4 for repair, make sure that you back up your data, and check that the computer has at least 2.5 GB of free disk space on its hard drive. The repair depot will need this space to install and run diagnostic software.

To check how much available space you have on your hard drive, follow these steps:

1. Click once on the hard drive icon on your desktop to highlight it.
2. From the **File** menu, choose **Get Info**.
3. The resulting window shows you how much space you have available.

Logic Pro 7.1: AAF export does not work with Mac OS X 10.4 "Tiger"

This article has been archived and is no longer updated by Apple.

If you're using Logic Pro 7.1 in Mac OS X 10.4 or later and try to export a song as an AAF file, Logic Pro won't create the file. Instead, you'll get this message:

> "AAF internal error 0xffffffff"

To resolve this issue, update to Logic Pro 7.1.1 or later, available at Apple Downloads.

Published Date: Feb 18, 2012

Logic Pro/Express: Freeze cursor appearance prevents Audio Instrument track editing

This article has been archived and is no longer updated by Apple.

In Logic Pro and Logic Express, if you create a new song based on your Autoload Song or other template and try to open an existing Audio Instrument's user interface, the Freeze cursor may appear, even though the track isn't frozen. If you try to play the instrument live, you won't hear any sound.

Note: The freeze cursor is a unique cursor that only appears when you attempt to click on a parameter that cannot be altered when a track is frozen. You can see it in the following picture.

This happens if you've previously opened your Autoload Song or other template, frozen an existing Audio Instrument track in the song, and then closed the song without saving. If you subsequently create another song based on the same template, the Audio Instrument track will still behave as if it was frozen.

To resolve this issue, simply start and then stop playback, and the Audio Instrument should behave normally.

This document will be updated as more information becomes available.

Mac OS X Server 10.3.9: Issues after upgrading Open Directory Master to Mac OS X Server 10.4

This article has been archived and is no longer updated by Apple.

If you use the CD version of Mac OS X Server 10.4 to upgrade a Mac OS X Server 10.3 Open Directory Master, you will experience issues with user authentication and Kerberos. These issues do not occur if you upgrade using the Installation DVD or NetInstall.

Verifying the issue

To see if your upgraded server is affected by this issue, open the log file, /Library/Logs/slapconfig.log. If your server is affected, you will see the following messages:

```
2005-06-28 14:46:15 -0700 - slapconfig -migrateldapserver
....
2005-06-28 14:46:48 -0700 - 5 Updating data in LDAP
...
2005-06-28 14:46:49 -0700 - ldapdelete command output:
ldap_bind: Can't contact LDAP server (-1)
2005-06-28 14:46:49 -0700 - ldapdelete command failed with status 1
```

In addition, you will see this overview message in Server Admin when you select the hostname of the server in Computers & Services:

> "This server contains new or upgraded services that need to be configured to use sign-on Kerberos authentication. Services that already use Kerberos on this server will not be affected. Select Open directory in the Computers & Services list, then click settings."

Preventing the issue

If you can't install from DVD or NetInstall, you can still prevent the issue while using the CD if you disable Auto Server Setup prior to installation. After the installation is complete, you will be taken directly into Server Assistant. **Do not complete the assistant yet.** Though this would not be done under normal circumstances, you must restart the server *before* using the assistant. To do this, either ssh the reboot command, quit Server Assistant (this will power off the system) or hold the power button. After restart, use Server Assistant to continue as normal.

After using the assistant, you'll need to copy a Kerberos command and preference file from another Mac OS X 10.4 system (either a server or client). To copy the "kerberosautoconfig" command from another 10.4 system, use the scp command in this manner (replacing "otherserver" with the name of the computer from which you intend to copy in the following commands):

```
% scp otherserver:/sbin/kerberosautoconfig /sbin
```

Then copy the "KerberosAutoConfig.plist" file from another 10.4 server by entering this:

```
% scp otherserver:/etc/mach_init.d/KerberosAutoConfig.plist /etc/mach_init.d
```

Alternatively, you could copy the contents of the plist file using the text below. Just copy everything below the following line, paste it into a text editor, and save it as a plain text file (not RTF) as "KerberosAutoConfig.plist" at /etc/mach_init.d/.

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plist PUBLIC "-//Apple Computer//DTD PLIST 1.0//EN" "http://www.apple.
com/DTDs/PropertyList-1.0.dtd">
<plist version="1.0">
<dict>
        <key>ServiceName</key>
        <string>com.apple.KerberosAutoConfig</string>
        <key>Command</key>
        <string>/sbin/kerberosautoconfig -x</string>
</dict>
</plist>
```

End copy above this line

Resolving the issue

If you are experiencing these issues and need to recover, follow these steps:

1. On the affected Open Directory Master, open Preferences in Workgroup Manager.
2. Select "Show all records Tab and Inspector."
3. Click the Accounts icon, then the target tab.

4. From the pop-up menu, choose **Config**. If you don't have replicas, skip to step 7.
5. Use WGM Inspector to remove any replicas in the Config / ldapreplicas record. Leave only the master in the LDAPReadReplicas attribute. Use the Delete key—not the Delete button—then save.
    a. Modify the KerberosClient config record's XMLPlist attribute to list only the master, then modify the generationID as well.
    b. Modify the ldapreplicas config record to list only the master in the LDAPReadReplicas attribute.
    c. Use Workgroup Manager Inspector to add a record in /Config.
    d. Click New Record, and change the name to "macosxodpolicy."
6. In the Open Directory settings portion of Server Admin, enable Directory Binding, then disable "Require clients to bind to directory."
7. In Directory Access, configure LDAPv3, select the Open Directory server, and click Edit.
8. Click the Search & Mappings tab, then reselect the Open Directory Server.
9. In the Search Base Suffix window, click OK. Note your Search Base Suffix you will need to use it later, it will be something like `dc=example,dc=com`.
10. Click the Write To Server button, then enter the LDAP root DN, such as:

    `uid=admin,cn=users,dc=example,dc=com and password, Search Base cn=config,dc=example,dc=com`

    to store the updated mappings.

11. If needed, set "Access this LDAPv3 server using" back to Open Directory Server, then click OK in the two panels.
12. Click the Authentication tab, set to custom path, enter /Ldapv3/127.0.0.1, and click Apply.
13. In Terminal, execute the following commands as root:

    Note: Use your realm name for REALM. The realm name can be found in the file /Library/Preferences/edu.mit.Kerberos and is normally set to the fully qualified domain name of the server in upper case, such as `SERVERNAME.EXAMPLE.COM`.

    ```
    % kdcsetup -e
    % sso_util configure -r REALM -x -v 1 all
    % sso_util configure -r REALM -x -v 1 ldap
    ```

14. You will need to get copies of the kerberosautoconfig command and plist files. Follow the steps from "Preventing the issue," above.
15. Execute this command:

    ```
    % /sbin/kerberosautoconfig
    ```

16. Add the neighborhoods and "accesscontrols" containers. Here is an example Terminal session that adds the neighborhoods container (you will need to do the same for accesscontrols):

    ```
    root# ldapadd -U locadmin -W -Y CRAM-MD5
    Enter LDAP Password:
    SASL/CRAM-MD5 authentication started
    SASL username: locadmin
    SASL SSF: 0
    <enter this text>
    dn: cn=neighborhoods,dc=example,dc=com
    cn: neighborhoods
    objectClass: container
    <press Control D>
    adding new entry "cn=neighborhoods,dc=example,dc=com"
    ```

    If you see the message "ldap_add: Already exists (68)," the file already exists, and you didn't need to create it again, though any attempt to do so is harmless.

    ```
    root# ldapadd -U locadmin -W -Y CRAM-MD5
    Enter LDAP Password:
    SASL/CRAM-MD5 authentication started
    SASL username: locadmin
    SASL SSF: 0
    <enter this text>
    dn: cn=accesscontrols,dc=example,dc=com
    cn: accesscontrols
    objectClass: container
    <press Control D>
    adding new entry "cn=accesscontrols,dc=example,dc=com"
    ```

    You may see the message "ldap_add: Already exists (68)" again; don't worry about it if you do.

17. To add the access controls to the directory, copy the access lines from the file /etc/openldap/slapd_macosxserver.conf to a temporary file to

be edited, then remove them from the original file. Copy the following lines from ther/etc/openldap/slapd_macosxserver.conf to a temporary file so that you can safely edit them:

```
access to attr=userPassword
        by self write
        by sockurl="ldapi://%2Fvar%2Frun%2Fldapi" write
        by group/posixGroup/memberUid="cn=admin,cn=groups,dc=example,dc=com" write
        by * read
access to attr=apple-user-authenticationHint
        by self write
        by sockurl="ldapi://%2Fvar%2Frun%2Fldapi" write
        by group/posixGroup/memberUid="cn=admin,cn=groups,dc=example,dc=com" write
        by * read
access to attr=apple-user-picture
        by self write
        by sockurl="ldapi://%2Fvar%2Frun%2Fldapi" write
        by group/posixGroup/memberUid="cn=admin,cn=groups,dc=example,dc=com" write
        by * read
access to *
        by sockurl="ldapi://%2Fvar%2Frun%2Fldapi" write
        by group/posixGroup/memberUid="cn=admin,cn=groups,dc=example,dc=com" write
        by * read
```

The edited entries should look like this (after adding a prefix number and removing the carriage returns):

```
1000:access to attr=userPassword by self write by sockurl="ldapi://%2Fvar%2Frun%2Fldapi" write by
group/posixGroup/memberUid="cn=admin,cn=groups,dc=example,dc=com" write by * read

1010:access to attr=apple-user-authenticationHint by self write by sockurl="ldapi://%2Fvar%2Frun%2Fldapi"
write by group/posixGroup/memberUid="cn=admin,cn=groups,dc=example,dc=com" write by * read

1020:access to attr=apple-user-picture by self write by sockurl="ldapi://%2Fvar%2Frun%2Fldapi" write by
group/posixGroup/memberUid="cn=admin,cn=groups,dc=example,dc=com" write by * read

1999:access to * by sockurl="ldapi://%2Fvar%2Frun%2Fldapi" write by
group/posixGroup/memberUid="cn=admin,cn=groups,dc=example,dc=com" write by * read
```

18. Use WGM Inspector to add a record in /AccessControls, click New Record, change the name to "default," then save the file.
19. In the /AccessContols/default record, add each of the edited lines from step 17 as a value of AccessControlEntry. Highlight the AccessControlEntry entry, click New Value, copy and paste a line into the text field, and save. Repeat this for each line.
20. Create a config record named "schema" using ldapadd:

```
root# ldapadd -U locadmin -W -Y CRAM-MD5
Enter LDAP Password:
SASL/CRAM-MD5 authentication started
SASL username: locadmin
SASL SSF: 0
<enter this text>
dn: cn=schema,cn=config,dc=example,dc=com
cn: schema
objectClass: top
objectClass: container
objectClass: extensibleObject
<press Control D>
adding new entry "cn=schema,cn=config,dc=example,dc=com"
```

21. Modify the slapd_macosxserver.conf file to read access controls from the directory while backing up the old file, just in case:

```
% cp /etc/openldap/slapd_macosxserver.conf /etc/openldap/slapd_macosxserver.conf.backup
```

(If slapd doesn't start after reboot, you can copy back the old config file.)

22. Remove all "access" lines (the ones added to the directory from above), and replace with:

```
access specified-in-directory apple-acl "cn=default,cn=accesscontrols,dc=example,dc=com"
```

The Access Controls in the LDAP database should now take effect the next time you launch slapd.

23. Add this Kerberos record using the kadmin.local command. Use your realm name in place of `REALM`, below, and your server's fully qualified domain name, such as:

```
# kadmin.local -r REALM -q "addprinc -randkey kadmin/hostname.example.com@REALM"
```

If you get a message the the policy already exists you can ignore it. it means the principal was already there.

24. Finally, execute:

```
% reboot
```

Smart Playlists stop updating dynamically on iPod

This article has been archived and is no longer updated by Apple.

If you have an iPod with a Click Wheel, Smart Playlists may stop updating dynamically after you update your iPod with iPod Updater 2005-06-26 or later. For example, if you rate a song on your iPod, the rating appears, but that same song won't appear in a Smart Playlist based on the same rating on your iPod. But this can happen with a Smart Playlist based on any criteria.

Use the iPod Updater 2006-01-10 or later to resolve this.

Note: This issue does not affect iPod nano or Fifth Generation iPod.

Mac OS X: "Recovered Items" in the Trash can be safely deleted

This article has been archived and is no longer updated by Apple.

After starting up in Mac OS X, sometimes you might find a "Recovered Items" folder in the Trash. Don't worry, you can safely delete this folder.

This folder contains items that are periodically flushed from your computer's temporary directory (/tmp).

Published Date: Oct 7, 2016

Mac OS X Server 10.4 or later: How to delete a user‘s blog

This article has been archived and is no longer updated by Apple.

Like home folders, a user's weblog will remain after you delete the account in Workgroup Manager. If you're an administrator, you can delete the weblog manually by following these steps:

1. In Server Admin, turn off weblogs.
2. Remove the following files:

```
/Library/Application Support/Weblogs/username
/Library/Tomcat/blojsom_root/webapps/ROOT/WEB-INF/username
```

3. In Server Admin, turn weblogs back on.

Mac OS X 10.4: Share point names are case sensitive

This article has been archived and is no longer updated by Apple.

Share point names are case sensitive in Mac OS X 10.4 and later, meaning that "MyDisk" and "mydisk" will be seen as two different volumes, for example. If you enter the wrong name in the "Connect to Server" dialog, you might see this message:

> **Mount Failed**
> Could not mount volume "users."

If you make the same name mistake at the command line, you might see this error message:

```
mount_afp: the mount flags are 0000 the altflags are 0020
mount_afp: AFPMountURL returned error -5019, errno is 2
```

To avoid this issue, make sure that you are using the correct lettercase when entering share point or file sharing server names. If you're sure the name is correct as entered, it could be that the volume has become unavailable.

Mac OS X: Managed client settings not working when away from the network

This article has been archived and is no longer updated by Apple.

To apply when away from the network, Managed Preferences defined in Workgroup Manager in Mac OS X Server 10.3 or later must be configured properly. If they're currently not working, resolve the issue by following these steps:

1. If you're using the Guest Computers list, make sure it's configured to define managed preferences. If you're using another computer list, be sure to manage at least one preference at the computer list level. Also, make sure the client computers are in the computer list.
2. Be sure that the cache setting for the computer list is set for two weeks or longer (17 days, for example). **Note:** Do not set the cache to 0 (zero). If you do, the cache won't be created.

Logic Pro: How to reinstall

This article has been archived and is no longer updated by Apple.
Normally, you shouldn't have to reinstall Logic Pro, but if a need arises (such as if you're troubleshooting), you can reinstall the software using these steps.

1. Click the Finder icon in the Dock.
2. From the **Go** menu, choose **Go to Folder**.
3. In the resulting dialog, type `/Library/Receipts` in the field.
4. Click Go.
5. From the resulting window, drag the following items to the Trash (depending on which versions and updates you've installed, some of these files may not be present):
    - Logic Pro.pkg
    - Logic Pro Sound Library.pkg
    - Logic Pro Bonus Sound Library.pkg
    - LogicPro701Updater.pkg
    - LogicPro711Updater.pkg
6. Reinstall Logic from the original installation disc.
7. Use Software Update to get the latest Logic update.

Logic Express: How to reinstall

This article has been archived and is no longer updated by Apple.

Normally, you shouldn't have to reinstall Logic Express, but if a need arises (such as if you're troubleshooting), you can reinstall the software using these steps.

1. Click the Finder icon in the Dock.
2. From the **Go** menu, choose **Go to Folder**.
3. In the resulting dialog, type: `/Library/Receipts` in the field.
4. Click Go.
5. From the resulting window, drag the following items to the Trash (depending on which versions and updates you've installed, some of these files may not be present):
    - Logic Express.pkg
    - Logic Express Sample Library.pkg
    - LogicExpress701Updater.pkg
    - LogicExpress711Updater.pkg
6. Reinstall Logic Express from the original installation disc.
7. Use Software Update to get the latest Logic Express update.

iSync 2.1 won‘t open; blank icon appears in the Dock

This article has been archived and is no longer updated by Apple.

If you manually delete iSync 2.0 (which comes with Mac OS X 10.4 Tiger) and then install the iSync 2.1 update, the application won't open. Its icon will become blank (a generic icon) when you click it.

To resolve this issue, perform an Archive and Install installation of Mac OS X 10.4 or later, then install iSync 2.1. If you want to preserve your existing user accounts, Home folders, and network settings, be sure that you select the "Preserve Users and Network Settings" option (this is selected by default).

For the best results, use Software Update after reinstalling the operating system and before launching iSync or any other applications.

Compressor 2: Distributed processing may seem slow

This article has been archived and is no longer updated by Apple.

When you use Compressor 2.0 to distribute processing, it may take more time to complete a batch if one or more of the computers in the cluster has a slower processor or processors. You'll notice this much more when a batch contains only one source movie with few settings applied to it.

To resolve this issue, update Compressor to version 2.0.1 using Software Update, and update all computers in the cluster to Apple QMaster 2.0.1.

DVD Player: Can‘t adjust digital output volume or Audio Equalizer settings during playback in Tiger

This article has been archived and is no longer updated by Apple.

When you use DVD Player to play a movie in Mac OS X 10.4 Tiger, you won't be able to adjust the digital audio output volume (a feature on some Power Mac G5 and iMac G5 computers) in DVD Player. Also, adjustments to the Audio Equalizer settings while playing a movie in DVD Player will have no effect on digital audio output.

Although you can move the DVD Player volume slider, only external analog speakers and built-in speakers respond to the volume change.

If you need to adjust the volume on your digital output, use the volume control on your external digital audio device instead.

Compressor 2: Assigning files to surround sound channels

This article has been archived and is no longer updated by Apple.

In the Compressor 2 User Manual, the section entitled "Assigning Files to Surround Sound Channels (Automatic Methods)" contains inaccurate instructions; the channel identifier codes listed in the manual are incorrect. If you use the channel identifier codes listed, you will not get a single surround source media file in the Batch window.

When you include channel identifier codes in the file names of a group of mono AIFF audio files and then drag the entire group of files into the Batch window in Compressor, the files will be assigned to the appropriate surround channels when they are converted to an AC-3 file (Dolby Digital format).

If you want to assign mono AIFF files to particular surround channels, you should use the following channel identifier codes:

Surround Channel	Channel Identifier Code
Left	-L
Right	-R
Center	-C
Surround Left	-RL
Surround Right	-RR
Surround Center	-RC
Subwoofer	-LFE

For example, if you want to assign a certain AIFF file to the Surround Left channel, rename the file as *filename*.-RL.aiff (where *filename* is the name of your file).

Note: This procedure only works when you drag and drop files into the Batch window. If you drag the files onto the application icon, they will appear as separate sources.

iSync 2: "POSIX error" when syncing Motorola phone

This article has been archived and is no longer updated by Apple.

If you're using iSync 2 in Mac OS X 10.4 to sync with a Motorola phone though USB, you may see this alert:

> "POSIX error: Device not configured, device unplugged during sync"

This might occur after interrupting a sync. To resolve the issue, just follow these steps:

1. Turn off the phone and disconnect it from the computer.
2. Restart your Mac.
3. Turn the phone on and reconnect it.
4. Sync again.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Soundtrack Pro: Document could not be saved error

This article has been archived and is no longer updated by Apple.

When you save an audio file project as a QuickTime file in Soundtrack Pro, you may see an error that says the document could not be saved:

This happens when the drive you're saving to doesn't have enough free disk space to store the file. To resolve this issue, either free up space on the drive or save to another drive with enough available space.

Published Date: Oct 7, 2016

iPhoto 5 or later: Desktop "change picture" feature does not work with new iPhoto albums

This article has been archived and is no longer updated by Apple.

In the Desktop & Screen Saver pane of System Preferences, you can select a folder of images or an iPhoto album to display desktop pictures that automatically change at a specified interval, like a slideshow. To enable the feature, just select a source in the pane and then select the "Change picture" checkbox.

While this feature works for iPhoto albums created in iPhoto 4, the "Change picture" checkbox and corresponding pop-up menu become unavailable (dim) when you select an iPhoto album that was created in iPhoto 5 or later. This occurs due to a change in the structure of iPhoto libraries.

As a workaround, you can set your desktop pictures directly in iPhoto instead of in System Preferences:

1. In iPhoto, select the pictures you want to appear on your desktop. **Tip:** After drag selecting a group of photos, you can Command-click to add or remove photos from the selection.
2. Click the Desktop button in iPhoto. Desktop & Screen Saver preferences will open with the selected photos as an iPhoto Selection, and the "Change picture" checkbox will already be selected.
3. Adjust the time interval or random checkbox as desired.

Note: Sometimes the desktop will "stick" on the previously selected group of images. If this happens, select a background from the Apple Images list in System Preferences, then repeat the steps above. If that still doesn't work, select a background from Apple Images, log out, then repeat the steps above again.

This document will be updated as more information becomes available.

WebObjects 5.2: Instances are not properly restarted in direct connect mode

This article has been archived and is no longer updated by Apple.

When you set the WODirectConnectEnabled flag to YES in WebObjects 5.2 or later (all platforms), application instances that are scheduled to restart periodically in JavaMonitor won't restart. You also won't be able to activate RefuseNewSessions in JavaMonitor, and WOApplication.refuseNewSessions() will not set the refusing state.

This happens because starting with WebObjects Release 5.2, the "refuseNewSessions" feature will not work in a deployed WebObjects application when WODirectConnectEnabled is enabled.

To resolve this issue, make sure that you set WODirectConnectEnabled to NO to disable it when deploying WebObjects applications. This is strongly recommended.

If you can't disable direct connect mode, modify the method "WOApplication.refuseNewSessions()" as follows:

```
// add a private variable to keep track of refusing state
// and initialize to false
private boolean myIsRefusingNewSessions = false;
```

```
public synchronized void refuseNewSessions(boolean aVal) {
    myIsRefusingNewSessions = aVal;
    // App will terminate immediately if the right conditions
   //  are met.
    if (myIsRefusingNewSessions &&
        (activeSessionsCount() <= minimumActiveSessionsCount()))
    {
        NSLog.debug.appendln("<"+this.name()+">: refusing new clients and below min active session threshold");
        NSLog.debug.appendln("<"+this.name()+">: about to terminate...");
        terminate();
    }
}
```

```
public boolean isRefusingNewSessions() {
// To be on the safe side also keep the 'original' information here
    return ((super.isRefusingNewSessions()) || myIsRefusingNewSesions);
}
```

Note: Disabling the direct connect mode can have the following effects on a deployed WebObjects application.

1. JavaMonitor uses a direct connect URL to access statistics, so the statistics page will no longer be accessible from JavaMonitor. However, statistics for a particular instance (e.g., 2) may be accessed by entering the appropriate web server URL in a web browser (http://myhost/cgi-bin/WebObjects/MyApp.woa/2/wa/WOStats).
2. Any local access of instances using direct connect will no longer be possible.

About the security content of the Mac OS X 10.4.2 Update

This article has been archived and is no longer updated by Apple.

This document describes the security content of Mac OS X 10.4.2, which can be downloaded and installed using Software Update, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How To Use The Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Mac OS X 10.4.2 Update

- **TCP/IP**

  CVE-ID: CAN-2005-2194

  Available for: Mac OS X v10.4, Mac OS X Server v10.4

  Impact: A specifically crafted TCP/IP packet can cause a denial of service.

  Description: A specifically crafted TCP/IP packet can cause the kernel to panic due to a null pointer dereference, and require a reboot. Multiple conditions are required to trigger this problem. The common practice of filtering source-routed and loose source-routed packets on network infrastructure, ingress routers, and firewalls can prevent systems from being affected. This issue does not affect previous releases of Mac OS X. Credit to Julian Y. Koh and colleagues of Northwestern University for reporting this issue.

- **Dashboard**

  CVE-ID: CAN-2005-1474

  Available for: Mac OS X v10.4, Mac OS X Server v10.4

  Impact: Users may install widgets that override Apple-supplied widgets.

  Description: Dashboard is distributed with Apple-supplied widgets, and users have the ability to add new ones. It is possible for a user to install a new widget with the same internal identifier as an Apple-supplied widget. If this occurs, the newly-installed widget will run in place of the system widget. It may not be clear to users that they are running a widget that they installed as opposed to the Apple-supplied one. This update addresses the issue by alerting users if they try to install widgets that would cause this sort of conflict. This issue does not affect previous releases of Mac OS X.

Xsan Admin: Network Services interface is seen in the computers list

This article has been archived and is no longer updated by Apple.

When you add computers to an Xsan network using Xsan Admin (Settings > Computers), those that have multiple network interfaces may appear in the computers list with their Network Services interface, rather than the interface used for metadata. This is normal.

After you authenticate and serialize an Xsan computer, it will appear in the computers list with its Bonjour name. To ensure that metadata is traveling across the intended metadata interfaces, make certain that there is a communication path between the metadata interface of each metadata controller (MDC) and each client metadata interface.

To determine the interface that each MDC is using for metadata:

1. Select the Metadata Controller in Xsan Admin (Settings > Computers).
2. Click the Edit button.
3. Look at the **Access the SAN via** pop-up menu, which specifies the IP address used to communicate metadata.

Note that the **Access the SAN via** pop-up menu on Xsan clients will be dimmed and set to **Automatically Chosen**. If there is an unobstructed network link between each MDC's metadata interface and each client, the Xsan clients will automatically communicate metadata over the interface specified by the MDC's **Access the SAN via** pop-up menu.

To properly configure computers with multiple network interfaces, make sure that the metadata network is a separate physical network from the WAN network, as described in Xsan documentation:

1. Check Xsan Admin (Setup > Computers) and make sure that the metadata controllers (MDCs) are set to connect to the Xsan network using the interface that is reserved for metadata—not the WAN interface.
2. Ensure that the Network Services interface is the highest priority in your Port Configurations list (for instructions, see the "Adjusting port priority" section in the article, "Using network locations in Mac OS X").

Audio drops out or has glitches at the beginning of a clip in Soundtrack Pro

This article has been archived and is no longer updated by Apple.

When you play a Soundtrack Pro project, you may hear the audio drop out briefly or hear glitches during playback when the playhead reaches the beginning of a clip in a track.

This can happen if one or more of the track's envelopes has a large number of changes in value just before the clip begins. For example, the image below shows a gradual volume ramp right before the start of a clip.

In this case, you can get the same audible result by placing the desired volume event exactly at the start of the clip, and the clip will play back smoothly. You can Control-click on an automation point and choose either **Copy value from previous point** or **Copy value from next point** from the pop-up menu.

Updating to Soundtrack Pro 1.0.2 or later will resolve this.

Published Date: Oct 7, 2016

WebObjects 5.2: xcodebuild won‘t build a project

This article has been archived and is no longer updated by Apple.

Sometimes a WebObjects application that builds successfully in Xcode may not build with the command-line tool "xcodebuild." You may see errors such as "Cannot resolve symbol." This issue affects:

- WebObjects 5.2.x
- Xcode 1.5 (Mac OS X 10.3.x)
- Xcode 2.0 (Mac OS X 10.4)

To resolve this issue, force xcodebuild to recreate the Java file list every time you build the project.

1. Open the project in Xcode.
2. In the Groups and Files list, open the Targets list, and double-click the Application Server target to put it into editing mode.
3. Click Settings and select Expert View.
4. Click the plus sign (+) button to add a new build setting.
5. In the Name column, enter `JAVA_FORCE_FILE_LIST`, and in the Value column, enter `YES`.
6. Close the project.
7. Rebuild the project with the xcodebuild command-line tool.

The project should now build successfully.

Soundtrack Pro displays "Disk Limit" messages

This article has been archived and is no longer updated by Apple.

While working in Soundtrack Pro, you may get the following alert message under some circumstances:

> "Disk Limit: Soundtrack Pro is dropping audio because your computer's hard disk cannot deliver all of the audio in time. Try removing long files or quitting applications."

This disk overload message appears when the amount of data to be streamed from your computer's hard disk exceeds the disk's capacity to deliver it in real time. There are several possible reasons why this can happen. Try one or more of the following tips to avoid the issue:

- If other applications are accessing the hard drive, there will be less bandwidth available for Soundtrack Pro. Quit other applications to give Soundtrack Pro optimal access.
- If you are using the internal drive on a portable computer, it may help to use a faster external drive.

You can set Soundtrack Pro preferences to not display this dialog. To do so, choose **Soundtrack Pro** > **Preferences**, then click the General tab in the resulting window. In the "Alerts and Saving" section, click the **Show Alerts** pop-up menu and uncheck the **Disk overload message** option. You can still export mixes in this situation (with or without the error turned on), as exporting is not a realtime process.

Please note that turning off the message will not prevent audio from being dropped when your hard drive is asked for more than it can deliver, but your session will continue to play.

If you are experiencing audio glitches with Soundtrack Pro, please check this document.

Using a Motorola phone featuring iTunes

This article has been archived and is no longer updated by Apple.

This article does not cover iPhone support in iTunes. For more information about iPhone support in iTunes click here.

Taking your music with you is even simpler. Just connect your Motorola phone featuring iTunes via USB and transfer the songs you want.

Note: If you see a Motorola phone featuring iTunes icon in the Mac desktop or in Windows Explorer, but not in iTunes, check the following:

- Make sure your computer meets the minimum system requirements:
  Mac OS X
  - Mac OS X 10.3.6 or later.
  - iTunes 4.9 or later

  Windows
  - Windows 2000 with the latest Service Pack, or Windows XP
  - iTunes 4.9 or later.

- If you have a Mac, you can check Software Update to see if the iTunes Phone Driver update is available for your version of iTunes. Or you can either download the latest version of iTunes or install the version on the iTunes-enabled mobile phone CD.

If you're using Mac OS X 10.4 to sync with your phone, click here for troubleshooting information.

If you're having difficulty transferring certain songs you've purchased from the iTunes Store, click here for more information.

Mac OS X 10.4: "The ‘%@‘ preferences pane could not be removed" alert

This article has been archived and is no longer updated by Apple.

If you've installed third-party applications that install their own preference panes in System Preferences, you can easily remove the third-party panes. However, sometimes the instructions may not work for you. For example, you may get the following alert when you try to remove a pane:

If so, use these steps instead:

1. Close System Preferences if it's open.
2. In the Finder, choose **Go to Folder** from the **Go** menu.
3. In the resulting dialog, type `/Library/PreferencePanes/`
4. Click Go (or press Return) to open the PreferencePanes folder.
5. Locate your third-party preference pane files (they end with ".prefPane"), and move the ones you don't want out of the folder or put them in the Trash (enter an administrator's password if prompted).

Note: If you want to reinstall the third-party preference pane, use the third-party software's installer. Make sure you're using a current and compatible version of the software.

About the Mac OS X 10.4.3 Update (Delta)

This article has been archived and is no longer updated by Apple.

The Mac OS X 10.4.3 Update (Delta) updates Mac OS X 10.4.2 to version 10.4.3. (If you are updating from *Mac OS X 10.4 or 10.4.1* to 10.4.3, see this article instead.)

Important: Please read before installing.

- You may experience unexpected results if you have third-party system software modifications installed, or if you've modified the operating system through other means. (This does not apply to normal application software installation.)
- The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to update.
- If issues occur during installation—for example, Software Update quits unexpectedly—please see this article.

Installation

You have two ways to update to Mac OS X 10.4.3: Use Software Update or the standalone installer. You only need to use *one* of these methods to update your computer.

Automatic Software Update
Software Update, located in System Preferences, can automatically download the latest Apple software. (Software Update might have linked you to this article to learn more about the update.)

Software Update notes:

- The update's size may vary from computer to computer when installed using Software Update.
- Because some updates are prerequisites for others, you may need to run Software Update more than once to get all available updates.

Standalone installer
Two versions of the installer (Delta and Combo, described below) are available from Apple Downloads as standalone updates. After you download an update, you can use it to update your computer without being connected to the Internet.

- The Delta Update installer (described here) updates Mac OS X 10.4.2 to 10.4.3.
- The Combo Update installer (described in this article) updates Mac OS X 10.4, 10.4.1, or 10.4.2 to 10.4.3 .

The standalone installer, particularly the Combo Update, is useful if you have multiple computers to update and only want to download the update once.

Improvements

This update offers many improvements, including:

Finder and Spotlight

- Improves responsiveness during Spotlight searches in the Finder.
- Spotlight comments entered in the Finder are now preserved when using iDisk syncing.
- Get Info windows correctly display non-Roman language versions and copyright strings.
- Improves the alert that appears when replacing an item during a copy when the capitalization of the items' names is the only difference.
- Permissions for items inside packages are now correctly set when applying permission changes to enclosed items in the Finder Info window.
- Items copied into a Drop Box have permissions set correctly.
- Addresses an issue in which Spotlight cannot find a file after using iPhoto to rename it if the filename originally contained an ampersand (&).
- The Spotlight image indexer now uses the "Software" TIFF property to support graphics rendering and image editing applications that use this property.

Safari, Internet, and networking

- Safari can now pass the "Acid2" test.

- Improves compatibility of Safari with many webcams.
- Improves the handling of Hebrew and Arabic text in Safari and Mail.
- Improves compatibility for OpenGL-accelerated Macromedia Shockwave 3D webpage content when using Safari.
- Addresses an issue in which an SMB volume might not mount again after it's unmounted.
- Addresses some issues in which the Finder might not be able to connect to an SMB volume.
- Bluetooth Setup Assistant now lets you toggle the Modem menu extra on or off (you can also use System Preferences).
- Resolves an issue in which Internet Connect wouldn't connect to a dial-up ISP if the account password contained a double-quote (") character.
- Improves compatibility with Squid proxy servers.
- Japanese file names are no longer garbled when connecting to Microsoft Windows 2003 Server through AFP.

Syncing

- With this update, you no longer need to store Address Book contact URLs in the Notes field when syncing with .Mac.
- Mac sync error alerts now provide a better description of the issue (for more details about a .Mac sync error, see the dotmacsync.log file).
- Allows your Address Book contacts that are organized in subgroups to be synced to an iPod using iTunes.

Mail

- Addresses an issue in which Mail might prompt you to download items attached to an IMAP email message more than once.
- In the Fonts & Colors preferences in Mail, you can now customize the font used in the list of Mailbox names.
- Smart Mailboxes that use "Entire Message Contains" and another criteria with the "any" qualifier now work as expected.
- Smart Groups of addresses can now be dragged from Address Book to a message's To, Cc, or Bcc field.
- The number of messages in a Smart Mailbox are now displayed in the title bar.
- Pressing Tab while composing a Mail message now inserts a tab character, instead of four spaces.
- Accounts created in Mail after installing this update will avoid an issue in which .Mac mail could not be sent if the Internet Service Provider blocks port 25.
- Reduces the amount of blank lines Mail might insert into a message when forwarding or replying to it.
- Addresses an issue in which some Mail rules could be *lost or duplicated* after a .Mac sync.
- Addresses in the "To:", "Cc:", "Bcc:" fields, as well as the Accounts pop-up menu, no longer appear in red if the address is in a different lettercase than what is entered in the "Mark addresses not in the domain" field; for example, "Mac@MAC.Com" will no longer be marked in red if the "Mark addresses not in the domain" field contains "mac.com."
- Searches of "All Mailboxes" can now, optionally, include items from Junk and Trash.
- Resolves an issue in which meeting requests sent from Microsoft Outlook to an Exchange account in Mail might not appear.

iChat

- iChat preferences now allow you to display emoticons (such as a smiley face) as text (such as " **:-)** ") instead of as a graphic.
- Resolves an issue in Activity Monitor in which you might see "iChatAgent (Not Responding)" in red text, even though iChat works just fine.
- Addresses a "No data has been received for the last 10 seconds" alert that could often appear when participating in a video chat in iChat with someone using AIM on a PC.

- .Mac members can enable encrypted chat sessions after installing this update.
- Further addresses potential causes of persistent "insufficient bandwidth" alerts.

Other applications

- Disk Utility can now verify your Mac OS X 10.4 startup volume if it is Mac OS X Extended (Journaled)-formatted.
- Many improvements for Calculator are included, such as: A black triangle icon no longer appears below "Infinity." Calculator now filters out unusable characters when pasting from the Clipboard, certain "rounding error" issues are addressed, and other issues.
- Addresses an issue in which iCal could not publish or subscribe to a secure URL if your password contained a question mark (?).
- Addresses an issue in which Preview might only print the first page of a multipage TIFF document.
- Keychain Access searching is no longer case-sensitive after installing this update.
- This update allows Keychain Access to directly import .pkcs12 files.
- X11 windows no longer stay in the background after selecting the X11 application from the Dock or with Application Switcher.

Other

- Software Update now lets you know when only ignored (hidden) updates are available for installation.
- Addresses an issue in which incoming faxes are saved as "from unknown" PDF files.
- Addresses an issue in which some Traditional Chinese input methods, such as Pinyin, limit the number of candidate characters presented in the candidate window.
- Resolves an issue for Palm Desktop software in which the Command-Q keyboard shortcut would sometimes not quit the application unless it was pressed a second time.
- Improves compatibility with Microsoft IntelliPoint mouse modifier clicking; that is, mouse buttons configured to act as a Control-click or Command-click, for example.
- Improves window scrolling when dragging an item into a window that's viewed as a list, where not all of the list is visible.
- Improves compatibility with Microsoft Word and Excel 2004, addressing an issue in which the application could stop responding for several seconds.
- Addresses an issue in which cases and/or specific user conversion dictionaries could be disabled after upgrading to Tiger.
- Addresses performance issues affecting three AppleScript commands: *do shell script*, *system info*, and *delay*.
- The Core Data framework has been updated to improve relationship management issues, resolve issues with data migration, improve Undo and Redo commands, and improve insertion performance.
- Resolves a potential redraw issue in which an application window's scroll bars could appear in the wrong place.
- Allows Apple Wireless Keyboards to work in single-user mode.
- Addresses an issue in which high ASCII characters in a password could lead to a blue screen at startup, or prevent log in.
- MS-DOS-formatted volumes, including the iPod Shuffle, perform better and consistently mount (become available) in the Finder.
- Improves results when printing to an optional envelope feeder on some printers.
- Disables Quartz 2D Extreme—Quartz 2D Extreme is not a supported feature in Tiger, and re-enabling it may lead to video redraw issues or kernel panics.
- Includes previous standalone security updates.

About the Mac OS X 10.4.3 Update (Combo)

This article has been archived and is no longer updated by Apple.

The Mac OS X 10.4.3 Update (Combo) updates Mac OS X 10.4, 10.4.1, or 10.4.2 to version 10.4.3.

Important: Please read before installing.

- You may experience unexpected results if you have third-party system software modifications installed, or if you've modified the operating system through other means. (This does not apply to normal application software installation.)
- The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to update.
- If issues occur during installation—for example, Software Update quits unexpectedly—please see this article.

Installation

You have two ways to update to Mac OS X 10.4.3: Use Software Update or the standalone installer. You only need to use *one* of these methods to update your computer.

Automatic Software Update
Software Update, located in System Preferences, can automatically download and install the latest Apple software. (Software Update might have linked you to this article to learn more about the update.)

Software Update notes:

- The update's size may vary from computer to computer when installed using Software Update.
- Because some updates are prerequisites for others, you may need to run Software Update more than once to get all available updates.

Standalone installer
Two versions of the installer (Delta and Combo, described below) are available from Apple Downloads as standalone updates. After you download an update, you can use it to update your computer without being connected to the Internet.

- The Delta Update installer (described in this article) updates Mac OS X 10.4.2 to 10.4.3.
- The Combo Update installer (described here) updates Mac OS X 10.4, 10.4.1, or 10.4.2 to 10.4.3 .

The standalone installer, particularly the Combo Update described here, is useful if you have multiple computers to update and only want to download the update once.

Improvements

This update offers many improvements. For a list of some of them, see this article.

Mac OS X 10.4: Japanese message doesn‘t appear correctly in web mail or on cell phone when sent from Mail

This article has been archived and is no longer updated by Apple.

If you send a message from Mail in Mac OS X 10.4 that contains Japanese language characters, it may not appear correctly in web mail (email accessed from a webpage) or on some cell phones.

This can happen because Mail encodes Japanese language messages as UTF-8 by default when English is the primary language selected in International preferences.

To resolve this issue, use Terminal to switch from using UTF-8 encoding to ISO-2022-JP encoding:

1. Open the Terminal (/Applications/Utilities/).
2. Type the following command at the prompt:

   ```
   defaults write com.apple.mail NSPreferredMailCharset "ISO-2022-JP"
   ```

3. Press Return to execute the command.
4. Quit Terminal.

This document will be updated as more information becomes available.

About the security content of the AirPort 4.2 update

This article has been archived and is no longer updated by Apple.

This document describes the security content of AirPort 4.2, which can be downloaded and installed using Software Update, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How To Use The Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

AirPort 4.2

CVE-ID: CAN-2005-2196

Available for: Mac OS X v10.3.3 through Mac OS X v10.3.9, and Mac OS X v10.4.2

Impact: Mobile users with the original AirPort Card enabled could automatically associate to an unsecure network.

Description: When not associated with a known or trusted network, the original AirPort Card connects to a randomly generated network with a default WEP key. This can allow mobile users to automatically associate with untrusted networks without warning. This does not affect AirPort Express Cards, which currently ship in systems. This update addresses the issue by selecting a randomly-generated 128-bit WEP key. Credit to Dino Dai Zovi for reporting this issue.

Power Mac G5: Keyboard commands don‘t work during startup

This article has been archived and is no longer updated by Apple.

Normally, when your computer starts up, you can use certain keyboard shortcuts to tell the computer to start up from an optical disk, reset PRAM, start up in FireWire Target Disk mode, start up in verbose mode, and so forth.

In some circumstances, a Power Mac G5 may no longer function as expected. If you find the computer isn't responding to any of these startup keystrokes, follow these steps to troubleshoot the issue.

1. Disconnect all USB devices except your Apple keyboard and mouse. (Make sure the keyboard and mouse work correctly before you shut the computer down.) Test from this configuration to see if a USB device is interfering in any way.
2. Make sure that the Open Firmware password is not enabled.
3. Start up the computer and keep the power button held in until the Open Firmware screen appears. When you see the Open Firmware screen and prompt, type `reset-nvram` and press return to clear NVRAM. On the next line, type `reset-all` and press return to restart the computer.

If the issues persist after trying all these steps, your computer may require service. Please contact your local Apple Retail Store or Apple Authorized Service Provider for further assistance.

"Mac OS X Networking Update" error during iPod software installation

This article has been archived and is no longer updated by Apple.

If you try to install older iPod software onto a computer with Mac OS X 10.4 Tiger, you may see the following error message about a missing Mac OS X Networking Update:

> iPod 2 Software cannot be installed on this computer. This update requires the Mac OS X Networking Update.

This can happen with any Mac with Mac OS X 10.4 or later when you try to use older iPod software. To avoid this, download and install the latest iPod Updater.

Mighty Mouse: Using the side buttons to let go of an item

This article has been archived and is no longer updated by Apple.

If you're using a Mighty mouse with your computer, sometimes releasing the two side buttons may not release an item that you've selected. If this happens, you may have clicked another mouse button prior to releasing the side buttons. Try simultaneously pressing the side buttons again to release the item.

Published Date: Feb 19, 2012

Mighty Mouse: What to do if you accidentally click the secondary button

This article has been archived and is no longer updated by Apple.

When you click the secondary button on your Mighty Mouse, you will most likely see a contextual menu appear, depending on what you clicked on. In some applications, clicking the secondary button starts a certain function.

If you clicked the secondary button by accident, just click the primary button to clear the menu or action.

Published Date: Feb 19, 2012

Using Mighty Mouse to open applications

This article has been archived and is no longer updated by Apple.

You can make Mighty Mouse open applications with a single click of a button. To configure your Mighty Mouse to do this:

1. Open System Preferences (from the **Apple** menu, choose **System Preferences**).
2. Click Keyboard & Mouse to open its preference pane.
3. Click the Mouse tab.
4. Choose which button you want to assign to open the application. From the appropriate pop-up menu, choose **Other**.
5. This will bring up a navigation window. Navigate to and select the application you want, then click Open.

The button in the Mouse tab will now show which application it will open. For example, if you wanted the button to open DVD player, the menu next to the button will say `Open "DVD Player"`.

Note: This applies only to applications—not documents or AppleScripts.

Downloading iSync 2.1 with the softwareupdate command-line tool

This article has been archived and is no longer updated by Apple.

If you'd like to download iSync 2.1 with the softwareupdate command-line tool, make sure that your current working directory is at the root level of the startup volume (you should be at /). You can then use the softwareupdate tool to get iSync 2.1.

Note: iSync 2.1 requires Mac OS X 10.4 or later. It will not appear in Mac OS X 10.3.9 or earlier.

To see if this update is *available* for the computer via softwareupdate, execute these commands:

```
$ cd /
$ sudo softwareupdate -l
```

To *install* iSync 2.1 using the softwareupdate command-line tool, execute the following two commands:

```
$ cd /
$ sudo softwareupdate -i iSync\ 2.1
```

To install software updates with softwareupdate, you must run the command with sudo or as the root user. Be sure to include the backslash (\) character in "iSync\ 2.1" so that softwareupdate correctly interprets the space in the file name. Backslash is also known as "reverse solidus".

If you want to use Software Update (part of System Preferences—from the **Apple** menu, choose **Software Update**) to download iSync 2.1 instead of using softwareupdate, you needn't worry about what your current working directory is.

To learn more about this tool, type `man softwareupdate` in Terminal.

Mac OS X 10.4: Network error (bad server response -1011) when using Software Update

This article has been archived and is no longer updated by Apple.

If you're using Software Update in Mac OS X 10.4 "Tiger" and use a satellite-based Internet service provider (ISP) to connect, you may not be able to download updates. Instead, you may get an error code -1011 (bad server response) message.

You can address the issue by dragging these two Software Update Cache files to the Trash:

- "com.apple.SoftwareUpdate", located at `/Library/Caches/`
- "com.apple.SoftwareUpdate", located at `~/Library/Caches/`

Note: For locating the first file, `/Library` refers to the Library folder at the top level (or "root") of your hard disk. For the second file, the tilde (~) refers to your Home folder.

Deleting the cache files is a temporary solution, and will only allow Software Update to function correctly one time. You'll need to delete the cache files each time you use Software Update. As a workaround, you can also download standalone update installers from Apple Downloads.

iCal: Unable to find events created prior to 10.4.2 update

This article has been archived and is no longer updated by Apple.

After updating to Mac OS X 10.4.2, you may not be able to find iCal 2.0.2 events that were created prior to updating when using the search function in iCal.

When you search for a particular event in iCal, iCal won't display the event in its search results, but you can find the event by browsing to the appropriate day in an iCal calendar or by using Spotlight.

Solution

1. From the iCal **File** menu, choose **Backup Database**.
2. Quit iCal.
3. Navigate to ~/Library/Application Support/iCal/Sources.
4. Open each folder in the Sources folder and remove the file named "Index."
5. Open iCal; it will re-index your events.

Published Date: Feb 18, 2012

Compressor 1.x settings do not work with Compressor 2

This article has been archived and is no longer updated by Apple.

If you upgrade from Compressor 1.x to Compressor 2, the old presets from Compressor 1.x may still be available in Compressor 2 within the Custom folder in the Presets window. However, these settings do not work with Compressor 2.

Even though you can select and apply these older "inherited" settings to a job in the Compressor 2 Batch window, they will produce undesirable results. You should avoid using these settings and remove them instead. To remove them:

1. Quit Compressor if it's open.
2. Open ~/Library/Application Support/
   Note: The tilde (~) refers to your Home folder. For more information, see "Mac OS X: Using Your Home Directory."
3. Drag the Compressor folder to the Trash.

The next time you open Compressor 2, only the new Apple optimized settings will appear in the Preset window (these are stored in a new folder at the above location). Any custom settings you create in Compressor will also be stored in this folder.

Compressor 2 settings

This document will be updated as more information becomes available.

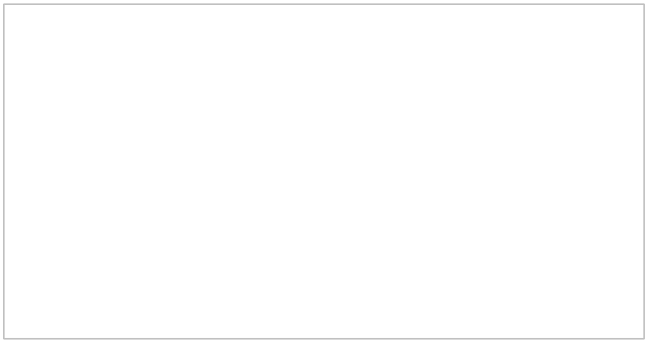
Update to iOS 12

Enjoy a faster and more responsive experience as well as fun new features, like Memoji and Camera Effects.

Get iOS 12



Find out about your coverage

AppleCare products give you additional repair coverage and technical support. If you already bought an AppleCare product, you can manage it online.

Check coverage for your product

Let’s get that fixed

If your Apple device needs repairs, you can go to an Apple Store, visit an Authorized Service Provider, or mail in your device. Whatever you choose, we'll make sure your device works the way it should.

Choose a repair option

Beware of counterfeit parts

Some counterfeit and third party power adapters and batteries may not be designed properly and could result in safety issues. To ensure you receive a genuine Apple battery during a battery replacement, we recommend visiting an Apple Store or Apple Authorized Service Provider. If you need a replacement adapter to charge your Apple device, we recommend getting an Apple power adapter.

Also non-genuine replacement displays may have compromised visual quality and may fail to work correctly. Apple-certified screen repairs are performed by trusted experts who use genuine Apple parts.

Using a third-party mouse with Mighty Mouse may cause unexpected behavior

This article has been archived and is no longer updated by Apple.

When you connect a Mighty Mouse to your computer, special settings for configuring the Mighty Mouse appear in the Keyboard & Mouse preferences. These settings may cause unexpected behavior with a third-party multibutton mouse if it is connected to your computer at the same time as the Mighty Mouse.

To avoid this issue, only connect one mouse at a time to the computer.

Published Date: Feb 18, 2012

Mighty Mouse: Always assign a unique function to each button

This article has been archived and is no longer updated by Apple.

If you assign one of your Mighty Mouse buttons to do the same function as another button, the original button will change its setting. To avoid such conflicts, always assign a unique function to each button.

The only exception to this is that you can set both the left and right buttons to act as the primary button—if you do this, both buttons will behave the same way regardless of whether you left-click or right-click.

iCal: Change the paper size setting if you can‘t print a calendar

This article has been archived and is no longer updated by Apple.

Having a hard time printing an iCal calendar in Mac OS X 10.4 because only a portion of the calendar prints? Try choosing a different paper size setting:

1. In iCal, choose **Print** from the **File** menu.
2. Select a different paper size from the **Paper** pop-up menu, such as **A4** or **A5**. You don't have to actually put A4- or A5-sized paper in your printer.
3. Print the calendar.

This document will be updated as more information becomes available.

.Mac: How to verify and change your .Mac auto renewal settings

This article has been archived and is no longer updated by Apple.

If you set your .Mac account to automatically renew each year, you can verify your .Mac renewal settings by accessing the Account section of .Mac. The Account Settings page displays the details of your .Mac account, including your storage information, bandwidth, and the date that your account is scheduled to renew.

If your account is within 60 days of renewal, you will see a button that says "Review my Renewal Settings." Click this link to view or modify your renewal settings and add or subtract upgrades to or from your account, respectively.

If you are not within 60 days, you can enable or disable the Auto-Renew option; just click the Credit Card Info button on the Account page and make your changes on the resulting page.

Note: Any upgrades that you add or remove on the Renewal Settings page will take effect on your renewal date.

Motion unexpectedly quits when exporting a project

This article has been archived and is no longer updated by Apple.

If you customize the export settings in a Motion project, the application may unexpectedly quit the next time you open the project and try to export it again.

To make exporting easier, Motion includes a variety of export presets. You can customize the included export presets or create new presets to suit your specific needs. If you customize the settings by clicking "Options" and then changing any parameter before exporting your project, Motion may not be able to read the project file. The next time you try to export a QuickTime movie from your Motion project or change its advanced QuickTime compression or audio settings, Motion may unexpectedly quit.

This can happen with Motion 1 or 2 in Mac OS X 10.3 or 10.4. This issue doesn't occur if you use the existing presets or a custom preset that you previously created.

Update to Motion 2.0.1 to address this issue.

If this issue does occur and you're not able to update, you can correct it by editing the project file:

1. Close your Motion project.
2. Make a backup of your Motion project file.
3. Open your original Motion project in TextEdit (just drag the project onto the TextEdit icon in the Dock or in your Applications folder).
4. Choose **Edit** > **Find** > **Find** (or press Command-F) to open the Find window.
5. In the Find field, type `<videoFormatOptions>` and click Next.

6. TextEdit highlights the word in the project file. Select and delete the entire <videoFormatOptions> line and the <videoOptionsSize> line below it.

7. Look down a few lines and select and delete the entire <audioFormatOptions> line and the <audioOptionsSize> line below it.

8. Save the edited Motion project file.

iMac G5 Sleep Light Update: Restart your computer after installing

This article has been archived and is no longer updated by Apple.

The 'iMac G5 Sleep Light Updater' updates the firmware on your iMac G5 so that the sleep indicator light is not as bright during the evening. The daytime brightness remains the same.

When you install the iMac G5 Sleep Light Update, you will need to restart your iMac G5 for the software to take effect. You will not get a dialog that prompts you to restart your computer.

If you haven't installed the iMac G5 Sleep Light Update but wonder if you should, check Software Update (from the **Apple** menu, choose **Software Update**) to see if the update appears in the list. If it doesn't, you have either already installed it or the update doesn't apply to your computer.

Note: Once the update has started, do not cancel or interrupt it. The updater takes over one minute to complete. During the update, your computer fans will run at full speed, but will return to normal once the update completes.

This document will be updated as more information becomes available.

Mac OS X Server 10.4: Kerberos authentication services may not successfully start

This article has been archived and is no longer updated by Apple.

Network delays or DNS configuration issues may prevent Mac OS X Server 10.4 or later from starting Kerberos authentication services. If the services don't start, Kerberos authentication won't work.

Tip: To find out if Kerberos has successfully started, scope out the overview using Server Admin (**Server Admin > Open Directory > Overview**).

To resolve this issue, follow the steps below for your situation. Please note that in the following sets of instructions, we're referring to the example server that delivers Kerberos authentication services as Key Distribution Center, or "KDC."

Mac OS X Server 10.4 is installed

If you're running Mac OS X Server 10.4 or later but Kerberos authentication services won't start, follow these steps:

1. Configure DNS Services to resolve your KDC's IP address to a fully qualified domain name (FQDN, such as "www.example.com"). For instructions on how to configure DNS Services, see Network Services Administration.

   Optional: To ensure consistent Kerberos services, you can configure the hosts file to resolve the server's hostname to its IP Address. Note that the hosts file is not updated by the "changeip" command, so you must manually update it if you change the IP Address or hostname of the server.

   "Use a text editor to open the /etc/hosts file, then add the following entry to the end of the file:

   ```
   IP address FQDN
   ```

   ... where `IP address` is the IP address of the KDC, and `FQDN` is the fully qualified domain name that you specified on your DNS server.

   For example: `123.456.78.910 www.example.com`

2. In Terminal (/Applications/Utilities), execute the following command:

   ```
   sudo scutil --set HostName <FQDN>
   ```

   ... where `FQDN` is the fully qualified domain name of this server that was configured on your DNS server.

3. In Terminal (/Applications/Utilities), execute the following three commands:

   ```
   slapconfig -kerberize diradmin REALM_NAME
   sso_util configure -r REALM_NAME -f /LDAPv3/127.0.0.1 -a diradmin -p diradmin_password -v 1 all
   sso_util configure -r REALM_NAME -f /LDAPv3/127.0.0.1 -a diradmin -p diradmin_password -v 1 ldap
   ```

   (where `diradmin` is the directory administrator's short name, `diradmin_password` is the directory administrator's password, and `REALM_NAME` is the name of your Kerberos realm--which will usually be one's search domain in all uppercase characters--and `FQDN_of_KDC` is the FQDN to which your KDC's IP address resolves).

4. Reboot the KDC.

If Mac OS X Server 10.4 is not installed

If you haven't yet installed Mac OS X Server 10.4 but want to ensure that Kerberos authentication services will be active once you do install and configure it, do the following:

1. Install Mac OS X Server 10.4 on the KDC.
2. Once the installation completes, you will be prompted to configure the KDC in the Setup Assistant. Do *not* configure the server. Instead, hold the server's power button for 5 or more seconds, then start it again.
3. Start up the server in Single-User mode.
4. At the prompt, type: `fsck -yf`
5. If the computer indicates that the filesystem was modified, repeat the `fsck -yf` command until you get a message that states the filesystem is OK.

6. Once you get the "OK" message, type: `reboot`
7. Start up in Single-User mode again.
8. At the prompt, type: `mount -uw /`
9. Type: `sh /etc/rc`
10. Type: `sudo scutil --set HostName <FQDN>`

    ... where `FQDN` is the fully qualified domain name of this server that will be configured on your DNS server.

11. Use a text editor to open the /etc/hosts file, then add the following entry to the end of the file:

    ```
    IP address FQDN
    ```

    For example, `123.456.78.910 www.example.com`.

    (where `IP address` is the IP address of the KDC, and `FQDN` is the FQDN that you specified in step 10).

12. To exit Single-User mode, at the prompt, type:

    ```
    $ exit
    ```

    After the unit starts up, go through the Setup Assistant.

13. Complete the Server Setup Assistant.
14. Configure DNS Services to resolve your KDC's IP address to a FQDN. For instructions on how to configure DNS Services, see Network Services Administration.

Mac OS X 10.4: How to change an application‘s language to be different from the primary system language

This article has been archived and is no longer updated by Apple.

In Mac OS X "Tiger" versions 10.4 to 10.4.2, you can't deselect an application's primary system language in the Info window (the window you see after selecting an application in the Finder and choosing File > Get Info). For example, if you have German set as your computer's primary system language, the "German" checkbox in the Languages section of the Info window will be dimmed.

To resolve this issue, update to version 10.4.3 or later. After updating, you'll be able to deselect the primary system language as long as at least one other language box remains checked. When only one language is checked, it will remain dimmed until at least one other language checkbox is selected.

If for any reason you're unable to get 10.4.3 immediately, you can follow the workaround presented below. We're going to assume that German is the primary system language and that you want to use Logic in English in this example, but the same steps apply for other language combinations.

1. From the **Apple** menu, choose **System Preferences**.
2. Click International, then click the Language tab. The computer's primary language is listed at the top of the list (Deutsch in this example).
3. Drag English to the top of the list.
4. Quit System Preferences.
5. Log out of your computer (from the **Apple** menu, choose **Log Out *your_name***), then log back in.
6. Select the desired application in your Applications folder.
7. Choose **File > Get Info**.
8. Click the Languages disclosure triangle in the Info window.
9. Deselect the German checkbox, then close the window.
10. Go back to the International preference pane, but this time drag Deutsch to the top of the list, leaving English in the second position.
11. Log out and back in again so that the language change takes effect.

Now your application will use English, even though the primary system language is German.

Logic Pro/Express 7: Lyrics appear as symbols instead of words

This article has been archived and is no longer updated by Apple.

With certain fonts, lyrics that you enter in the Score window in Logic Pro 7 or Logic Express 7 may appear as music dynamic markings instead of as words. To avoid this issue, do not use the following fonts in Logic:

- Baskerville Semibold
- Futura Condensed
- Helvetica New Black Condensed
- Helvetica New Bold Condensed
- All CE fonts (such as Times CE, Monaco CE, and so on)
- Lucinda Grande CY
- Monaco CY (Mac OS 10.4.2 only)

To change the font:

1. In the Score window, choose **Text > Text Styles**.
2. Assign a different font to Plain Text.

Published Date: Feb 19, 2012

Mac OS X Managed Client: How to prevent Dashboard access

This article has been archived and is no longer updated by Apple.

If you need to prevent someone from accessing Dashboard, there are several ways to do this. For purpose of this article, a "locally managed" client is one managed via Parental Controls settings in the Accounts preference pane; and a "networked managed" client is one managed via Workgroup Manager.

Locally-managed clients

To prevent Dashboard from opening when selected, enter this command in Terminal at a client computer:

```
defaults write com.apple.dashboard mcx-disabled -boolean YES
```

Network-managed clients

For network-managed clients, you have a choice of two ways to do this. The first method is preferred.

Method 1: Prevent all access to Dashboard

You can configure this setting using the Preference Editor in Workgroup Manager by following these steps:

1. Execute the above command on a system (if you haven't already), which will generate a plist file needed for a later step.
2. Open Workgroup Manager and select a user, group, or computer list.
3. Select Preferences.
4. Click the Details tab.
5. Click the Add button, then navigate to the plist file:

   ```
   /Users/User_Name/Library/Preferences/com.apple.dashboard.plist
   ```

   Note: If desired, you can edit the preference file and move this setting to the Always section. By default, Workgroup Manager will import it into the Often section. Use these steps:
   a. Select the com.apple.dashboard preference item.
   b. Click the Edit button.
   c. Click the disclosure triangle next to Often to reveal its contents.
   d. Delete all of the keys by selecting each key and then clicking the Delete button above.
   e. Click the disclosure triangle next to Always to reveal its contents (it will be empty by default).
   f. Add the following key by selecting "Always" and pressing the New Key button above:

   ```
   Name  Type Value
   mcx-disabled boolean true
   ```

6. Click the Apply Now button.
7. Click the Done button to dismiss the sheet.

Dashboard will still appear in the Dock as an active application, but it won't open when someone selects it.

Method 2: Disable the sub-launching option in Workgroup Manager

This method will prevent access to all Dashboard widgets. To do this, follow these steps:

1. Open Workgroup Manager and select a user, group, or computer list.
2. Select Preferences, then Applications.
3. Deselect the "Allow approved applications to launch non-approved applications" option to disable sub-launching.

This allows Dashboard to display, but you won't be able to open any widgets. Any currently open widgets will close automatically.

iSync: Can‘t sync Verizon Treo with iSync

This article has been archived and is no longer updated by Apple.

If you can't sync a Verizon-supplied Treo 650 (a Palm OS phone) with iSync, or if some data syncs with the Treo but other does not, make sure that the Treo is set to sync with other applications, as follows:

1. On the Treo, open the Wireless Sync application.
2. From the Wireless Sync **Setup** menu (press the menu button to make it appear), choose **Connection Settings**.
3. Click Advanced.
4. Select the "Enable other sync apps" checkbox.
5. Try to sync.

Mac OS X Server: "Could not verify the identity of the site" message when SSL is enabled on multiple sites

This article has been archived and is no longer updated by Apple.

When using any version of Mac OS X Server to serve sites with Web Services, you can enable SSL on multiple sites that resolve to a single IP address, but only the certificate of the first listed site will be used. This is due to a fundamental limitation of how SSL works.

When users connect to the other sites at the same IP address, they'll receive an error message like this:

> Could not verify the identity of the site www.example.com.

To resolve the issue, use a unique IP address for each SSL-enabled site.

Background: When an HTTPS connection is initiated, the two hosts first set up an encrypted transport and then send the request to the server for the website. The web server won't know what hostname is about to be requested until after the encrypted transport is established. Because there is no way to change the encryption mid-connection, there is no way to change the keys used.

Sound emanates from internal speakers even when a Bluetooth device is selected

This article has been archived and is no longer updated by Apple.

Audio may unexpectedly revert back to playing through your computer's internal speakers (or the sound out port) when a Bluetooth audio device, such as headphones, gets disconnected. Some examples of how a Bluetooth device can get disconnected include dead batteries, being powered off, or going out of range.

Even after the audio reverts to your computer's internal speakers, the Sound preference pane will still show Bluetoooth as the selected sound output source. When opening the Sound preference pane, a "Bluetooth Audio Failed" message will appear. You should simply dismiss the message and select "Internal Speakers" as the output source. This will get rid of the "Audio Failed" message and allow you to avoid further confusion until the next time you use the Bluetooth audio device.

Logic Pro 7: Ultrabeat, EXS24 or Audio Unit instrument not triggered by virtual keyboard

This article has been archived and is no longer updated by Apple.

Under certain circumstances, clicking the virtual keyboard in the Ultrabeat, EXS24 or Audio Unit instrument interface won't produce any sound. In this situation, the virtual keyboard in the Matrix window also fails to produce sound.

This issue only occurs when using multi-channel instances of instrument plug-ins on sounds that are assigned to outputs other than Main. If this happens, put Logic into play. Another solution is to play a MIDI note into the instrument, either from an external MIDI controller or the Caps Lock Keyboard in Logic, to resolve the issue.

This document will be updated as more information becomes available.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Compressor 2: Field order reversed when transcoding HDV to MPEG-2

This article has been archived and is no longer updated by Apple.

Symptom

When transcoding 1080i HDV video to MPEG-2 in Compressor 2, the MPEG-2 presets incorrectly reverse the field order. The results can appear as "jittery" video when viewed on an NTSC monitor or television.

Solution

To resolve this issue, install Pro Application Update 2005-02 using Software Update.

iTunes Store icon does not appear in iTunes 6

This article has been archived and is no longer updated by Apple.

Learn how to turn on the iTunes Store icon in iTunes 6 and earlier.

To access the iTunes Store, just click the green iTunes Store icon in the iTunes Source list, shown below. If this icon does not appear, it may be turned off.

If this is the case, follow these easy steps to turn the iTunes Store back on:

1. Install the latest version of iTunes. You can download iTunes (it's free) from the Download iTunes webpage. If iTunes is already installed on your computer, check your version and update if necessary.
2. Open iTunes.
3. If you're using a Mac, choose **Preferences** from the **iTunes** menu. If you're using Windows, click **Preferences** on the **Edit** menu.
4. Click the green Store button to display its preferences.
5. Select the "Show iTunes Store" checkbox.
6. Click OK.

Compressor and QuickTime: About the displayed frame size of MPEG-2 video

This article has been archived and is no longer updated by Apple.

The frame size you see reported for MPEG-2 video may not be accurate in all applications.

QuickTime has the ability to play back MPEG-2 content using the QuickTime MPEG-2 Playback Component, which is available as an add-on to QuickTime Player. This component is included with Apple DVD Studio Pro, Final Cut Pro, Motion, and Final Cut Studio.

Please note that the frame size reported by the MPEG-2 Playback Component represents the **displayed** size of the MPEG-2 video—not the actual pixels that comprise the video. This is due to the MPEG-2 format's use of non-square pixels.

The QuickTime MPEG-2 Playback Component displays MPEG-2 content in the correct geometrical proportions (4:3). For example, an NTSC MPEG-2 file for DVD-Video is commonly 720 pixels wide and 480 pixels tall. However, 720 x 480 is not equivalent to a 4:3 ratio. This is normal. In DVD playback, the software adjusts the geometry of the MPEG-2 video, scaling the image to the correct proportions.

The QuickTime MPEG-2 Playback Component will display a 720 x 480 MPEG-2 video as 640 x 480 to present the correct proportions. QuickTime Player (and some other applications that use QuickTime to display video) will report that the video is 640 x 480, but the actual pixel dimensions are still 720 x 480, conforming to the MPEG-2 specification for DVD-Video.

Similarly, PAL MPEG-2 video is displayed in the correct 4:3 aspect at a 720 x 540-pixel resolution, although the actual non-square pixels that comprise the video are really 720 x 576.

DVD Studio Pro (included with Final Cut Studio and available separately) can validate an MPEG-2 video file and reveal its actual dimensions. QuickTime Player, Final Cut Pro, and Compressor should not be used to validate an MPEG-2 video's frame size.

This document will be updated as more information becomes available.

iPod Software 1.2.1 for iPod with color display: Accessing and changing settings

This article has been archived and is no longer updated by Apple.

iPod Software 1.2.1 for iPod with color display includes many different settings options. This article will discuss these settings and how to change them. Please note that other versions of iPod Software may have different features and default settings.

You can change settings on an iPod with iPod Software 1.2.1 for iPod with color display in three different locations. You can access various settings in the Settings menu (in the main menu), in Photos > Slideshow Settings, and in Extras > Clock.

The Settings Menu

You can access the Settings menu from the main menu on your iPod (the menu that's labeled "iPod"). Here are the options you can access and change in the Settings menu.

- **About**
  The About option displays information about iPod, including:
  - Songs—The number of songs and audiobooks synchronized to iPod from iTunes.
  - Photos—The number of photos synchronized to iPod from iTunes.
  - Capacity—The size of the hard drive in bytes (find more information on how capacity is calculated).
  - Available—The amount of free space available on your iPod hard drive.
  - Version—The installed version of iPod Software.
  - S/N—Your iPod serial number.
  - Model—Your iPod model number.
  - Format—This option appears if iPod has been formatted for use with Windows-based computers.
- **Main Menu**
  This menu allows you to customize which menu options are displayed in the main menu.
- **Shuffle**
  Available settings: Off (default), Songs, Albums
  When you enable this feature, your iPod shuffles (randomly chooses) songs to play from an album, playlist, or iPod library, depending on your setting. For more information, see "iPod 1.1: About Shuffle."
- **Repeat**
  Available settings: Off (default), One, All
  This setting allows you to have iPod repeat a song or selected list. If you set Repeat to One, iPod repeats the selected song over and over. If you set it to All, your iPod repeats all the songs in the selected list (album, playlist, or library).
- **Backlight Timer**
  Available settings: Off, Always On, preset number of seconds (10 Seconds is the default)
  The Backlight Timer allows you to set how long the backlight illuminates so you can see your iPod display in dim lighting. If you set the Backlight Timer to Always On or one of the preset number of seconds, the backlight will turn on for the specified time any time you press a button or scroll the wheel. If Backlight Timer is set to Off, you can temporarily turn it on by pressing the Menu button for about 2 seconds; the backlight will then remain on for about 30 seconds.
  Note: You may have to charge your iPod battery more frequently if the backlight is constantly on.
- **Audiobooks**
  Available settings: Slower, Normal (default), Faster
  This setting allows you to select the playback speed when listening to audiobooks.
- **EQ**
  Available settings: Off (default), one of 21 equalizer presets
  iPod features the same equalizer presets available in iTunes to help make your audio sound even better. For more information, see "iPod: About the Equalizer."
- **Compilations**
  Available settings: On, Off (default)
  When you set Compilations to On, it adds a Compilations menu to the Music menu that displays all audio files that are identified as being part of a compilation.
- **Sound Check**
  Available settings: On, Off (default)
  This setting only works if you enabled the Sound Check feature in iTunes before synchronizing the audio files to iPod. When Sound Check is On, iPod adjusts all song volumes so that they all play at the same level.
- **Clicker**
  Available settings: Speaker (default), Headphones, Both, Off
  This setting controls the audible feedback when you scroll the wheel or press buttons. When you set Clicker to Speaker, you hear a clicking sound from only the internal speaker. If Clicker is set to Headphones, you hear the clicking sound only in the headphone output.
- **Date & Time**
  This setting allows you to set the time, date, and time zone. You can set iPod to display the time as a 12-hour (default) or 24-hour clock,

and whether the time displays in the title of most menus after a short period of inactivity (this setting is Off by default).

- **Contacts**
  This setting allows you to set the sort order and the display order of your contact names on iPod. By default, iPod sorts and displays names in "First Last" order. For more information, see "iPod: How to Change Contact Display and Sort Settings."
- **Language**
  iPod can display its menu items in a variety of languages. This setting does not change the native language of playlists, artists, or songs (you can do this in iTunes). When you first use iPod or reset iPod, you will be asked to select a menu language.
- **Legal**
  iPod displays a screen with legal information, including trademarks and copyrights.
- **Reset All Settings**
  Available settings: Cancel (default), Reset
  This menu choice always displays in English, regardless of the selected language. If you select Reset, all settings in the Settings menu will return to their default settings.

Photos > Slideshow Settings

You can access the Slideshow Settings menu from the Photos menu (accessible from the main menu) to control how your images appear in a slideshow. Here are the options that you can set to your liking.

- **Time Per Slide**
  Available settings: Manual, preset number of seconds (3 Seconds is the default)
  The Time Per Slide menu lets you set how long a photo appears in the slideshow. When you set Time Per Slide to Manual, you'll need to press the Next/Fast Forward button or the Previous/Rewind button to change slides. When you set it to any of the timed options, each photo appears for that specified time—if you want to skip to the next slide before the time has elapsed, press the Next/Fast Forward button or the Previous/Rewind button.
- **Music**
  Available settings: Off (default), From iPhoto, Playlist, On-The-Go
  This setting allows you to choose music to play during the slideshow. At the end of a slideshow, the music continues to play until you press the Menu button to end the slideshow. Here's what each setting offers:
  - From iPhoto—This option plays music from settings in iPhoto, and is only available if you selected iPhoto (Mac only) as the location to synchronize photos from in the iPod preferences pane in iTunes.
  - Off—No music plays during the slideshow.
  - Playlist—The audio files in the selected playlist play during the slideshow.
  - On-The-Go—Audio files in the On-The-Go playlist play during the slideshow. If you haven't added any audio files to the On-The-Go playlist on your iPod, no music plays.
- **Repeat**
  Available settings: Off (default), On
  If you set Repeat to On, the slideshow will repeat. To end a slideshow, press the Menu button.
- **Shuffle Photos**
  Available settings: Off (default), On
  When you set Shuffle Photos to On, the slideshow will display all photos in random order. This option won't repeat any photo until the slideshow has displayed each photo in the selection. If Repeat is also set to On, the order will change randomly on every pass through the selection.
- **Transitions**
  Available settings: Off, Random (default), preset transitions
  This setting allows you to select the type of transition used to go from one picture to the next in a slideshow.
- **TV Out**
  Available settings: Ask (default), On, Off
  The TV Out menu lets you set whether iPod displays the slideshow to its video out port or on screen. Ask is the default setting; iPod displays a Start Slideshow screen that lets you select the output. When you set TV Out to On, external television support is turned on. This setting requires more power and can quickly consume the battery (you should use an iPod Power Adapter or Dock to charge iPod while showing a slideshow on a television). When this option is Off, the slideshow is only displayed on your iPod display.
- **TV Signal**
  Available settings: NTSC, PAL
  This setting allows you to select the TV signal (the default is set to the standard signal for your country). If you select the wrong TV Signal setting, the TV image may appear gray, distorted, or rolling.

Extras > Clock

You can access the Clock menu from the Extras menu (in the main menu) to change the time and date settings on your iPod and more. Here's what you can set in this menu.

- **Alarm Clock**
  The Alarm Clock menu allows you to turn the alarm clock on or off (the default). You can set what time to set the alarm, and the sound the iPod produces when the alarm goes off (Beep is the default).

- **Sleep Timer**
  Available settings: Off (default), preset time in minutes
  This menu allows you to set how long your iPod plays music before going to sleep. When you set Sleep Timer to one of the preset times, a countdown timer appears in the Now Playing screen. Once the time expires, iPod stops playing and goes to sleep.
- **Date & Time**
  This setting allows you to set the time, date, and time zone. You can set iPod to display the time as a 12-hour (default) or 24-hour clock, and whether the time displays in the title of most menus after a short period of inactivity (this setting is Off by default).

iPod mini Software 1.4: Accessing and changing settings

This article has been archived and is no longer updated by Apple.

iPod mini Software 1.4 for iPod mini includes many different settings options. This article will discuss these settings and how to change them. Please note that other versions of iPod Software may have different features and default settings.

You can change settings on iPod mini with iPod mini Software 1.4 in two different locations. You can access various settings in the Settings menu (in the main menu) and in the Clock menu (Extras > Clock).

The Settings Menu

You can access the Settings menu from the main menu on your iPod mini (the menu that's labeled "iPod mini"). Here are the options you can access and change in the Settings menu.

- **About**
  The About option displays information about iPod mini, including:
  - Songs—The number of songs and audiobooks synchronized to iPod mini from iTunes.
  - Capacity—The size of the hard drive in bytes (find more information on how capacity is calculated).
  - Available—The amount of free space available on your iPod mini hard drive.
  - Version—The installed version of iPod Software
  - S/N—Your iPod mini serial number.
  - Model—Your iPod mini model number.
  - Format—This option appears if iPod mini has been formatted for use with Windows-based computers.
- **Main Menu**
  This menu allows you to customize which menu options are displayed in the main menu.
- **Shuffle**
  Available settings: Off (default), Songs, Albums
  When you enable this feature, your iPod mini shuffles (randomly chooses) songs to play from an album, playlist, or iPod library, depending on your setting. For more information, see "iPod: About Shuffle."
- **Repeat**
  Available settings: Off (default), One, All
  This setting allows you to have iPod mini repeat a song or selected list. If you set Repeat to One, iPod mini repeats the selected song over and over. If you set it to All, your iPod repeats all the songs in the selected list (album, playlist, or library).
- **Backlight Timer**
  Available settings: Off, Always On, preset number of seconds (10 Seconds is the default)
  The Backlight Timer allows you to set how long the backlight illuminates so you can see your iPod mini display in dim lighting. If you set the Backlight Timer to Always On or one of the preset number of seconds, the backlight will turn on for the specified time any time you press a button or scroll the wheel. If Backlight Timer is set to Off, you can temporarily turn it on by pressing the Menu button for about 2 seconds; the backlight will then remain on for about 30 seconds.
  Note: You may have to charge your iPod battery more frequently if the backlight is constantly on.
- **Audiobooks**
  Available settings: Slower, Normal (default), Faster
  This setting allows you to select the playback speed when listening to audiobooks.
- **EQ**
  Available settings: Off (default), one of 21 equalizer presets
  iPod mini features the same equalizer presets available in iTunes to help make your audio sound even better. For more information, see "iPod: About the Equalizer."
- **Sound Check**
  Available settings: On, Off (default)
  This setting only works if you enabled the Sound Check feature in iTunes before synchronizing the audio files to iPod mini. When Sound Check is On, iPod mini adjusts all song volumes so that they all play at the same level.
- **Contrast**
  This setting lets you control how light or dark the iPod mini screen displays. Scroll the wheel left to lighten the screen or scroll right to darken it (you can set the slider anywhere from an all white to an all black screen. If you accidentally set the contrast to something you cannot read, press the Menu button for about 4 seconds and the screen will return to its default setting.
- **Clicker**
  Available settings: Speaker (default), Headphones, Both, Off
  This setting controls the audible feedback when you scroll the wheel or press buttons. When you set Clicker to Speaker, you hear a clicking sound from only the internal speaker. If Clicker is set to Headphones, you hear the clicking sound only in the headphone output.
- **Date & Time**
  This setting allows you to set the time, date, and time zone. You can set iPod mini to display the time as a 12-hour (default) or 24-hour clock, and whether the time displays in the title of most menus after a short period of inactivity (this setting is Off by default).
- **Contacts**
  This setting allows you to set the sort order and the display order of your contact names on iPod mini. By default, iPod sorts and displays

names in "First Last" order. For more information, see "iPod: How to Change Contact Display and Sort Settings."

- **Language**
  iPod mini can display its menu items in a variety of languages. This setting does not change the native language of playlists, artists, or songs (you can do this in iTunes). When you first use iPod mini or reset it, you will be asked to select a menu language.
  Legal
  iPod mini displays a screen with legal information, including trademarks and copyrights.
- **Reset All Settings**
  Available settings: Cancel (default), Reset
  This menu choice always displays in English, regardless of the selected language. If you select Reset, all settings in the Settings menu will return to their default settings.

Clock menu (Extras > Clock)

You can access the Clock menu from the Extras menu (in the main menu) to change the time and date settings on your iPod mini and more. Here's what you can set in this menu.

- **Alarm Clock**
  The Alarm Clock menu allows you to turn the alarm clock on or off (the default). You can set what time to set the alarm, and the sound iPod mini produces when the alarm goes off (Beep is the default).
- **Sleep Timer**
  Available settings: Off (default), preset time in minutes
  This menu allows you to set how long your iPod mini plays music before going to sleep. When you set Sleep Timer to one of the preset times, a countdown timer appears in the Now Playing screen. Once the time expires, iPod mini stops playing and goes to sleep.
- **Date & Time**
  This setting allows you to set the time, date, and time zone. You can set iPod mini to display the time as a 12-hour (default) or 24-hour clock, and whether the time displays in the title of most menus after a short period of inactivity (this setting is Off by default).

Soundtrack Pro: "Missing some render files" error

This article has been archived and is no longer updated by Apple.

Note: This issue is resolved in Soundtrack Pro 1.0.3. This update is recommended for all Soundtrack Pro customers. Use Software Update or download updates here.

If you save a Soundtrack Pro audio file project (.stap) that contains disabled actions as a project with a different name using the Save As command, the newly saved project will display the following error when you reopen it:

This issue occurs if you choose **File > Save As** to save the Soundtrack Pro audio file project that includes a disabled action. As a workaround, first dismiss the error message by clicking OK. Then create the missing render file by re-enabling the disabled action and saving the .stap file. If necessary, you can then disable the actions again and save the file again.

This document will be updated as more information becomes available.

Power Macintosh 6500 or G3 w/56K Modem: AT Command Reference Location

I have a Power Macintosh 6500 series computer that came with an Apple/GV internal 56Kbps modem. I need to set a custom initialization string, but cannot find one. What should I do?
This article has been archived and is no longer updated by Apple.
The AT command reference for your Power Macintosh 6500 56Kbps modem is located on your hard disk in:

Hard Disk:Applications:FaxSTF:ATCom56flex(apple).pdf

It is located on the Restore CD in:

Restore CD:Macintosh HD Files:Applications:FaxSTF:ATCom56flex(apple).pdf

The AT command reference for the 56Kbps modem in a Power Macintosh G3 can be found on the Modem Software CD in the Modem Scripts folder.

Note:
Apple cannot provide guidance on the selection of specific modem initialization strings or modem commands. The initialization strings that you use are a function of the type of modem you are calling. Most modems simply require a factory reset (AT&F1 in this case) to enable or reset the basic features of the modem. The selection of such commands is a function of what you are trying to do; your internet service provider is normally the best source of special modem requirements.

Mac OS X 10.4: Keyboard Setup Assistant unexpectedly appears

This article has been archived and is no longer updated by Apple.

When you connect a keyboard (or device that acts similar to keyboard, such as a barcode scanner) to your computer, you may come across a situation where the Keyboard Setup Assistant opens. This happens when your computer doesn't recognize the keyboard you connected. Once you specify the keyboard type, you shouldn't see the Assistant again whenever you reconnect that keyboard (it should open only once per unknown keyboard connection).

However, if Keyboard Setup Assistant opens more often, such as after restarting or when you connect a non-keyboard device, just click the red close button in the upper-left corner of the window to "cancel."

In Mac OS X 10.4.1 or later, Keyboard Setup Assistant should no longer open each time you connect the keyboard or a device, or after restarting your computer (unless you add another new, unrecognized keyboard, of course).

Additional information

In Mac OS X 10.4.1 or later, when you close Keyboard Setup Assistant by clicking the red close button, your Mac assumes the device is an ANSI keyboard (and stores this in the preference file /Library/Preferences/com.apple.keyboardtype.plist). The device should then work normally, if it is an ANSI keyboard. If you have a non-ANSI keyboard device, use Keyboard preferences' Change Keyboard Type button to open the Keyboard Setup Assistant again.

Soundtrack Pro: Automation plays out of sync with audio

This article has been archived and is no longer updated by Apple.

Note: This issue is resolved in Soundtrack Pro 1.0.3. This update is recommended for all Soundtrack Pro customers. Use Software Update or download updates here.

When you add automation envelopes to a multitrack Soundtrack Pro project, the automation may play back at a later time than the audio (it's delayed).

This issue occurs if your Soundtrack Pro project is set to a higher sample rate than what your audio hardware can handle. To avoid this issue, always make sure to set your project to a sample rate that your audio hardware supports (choose **Soundtrack Pro > Preferences > Project** to set the sample rate).

Published Date: Oct 7, 2016

Soundtrack Pro: Normalize script does not analyze files before processing

This article has been archived and is no longer updated by Apple.

Note: This issue is resolved in Soundtrack Pro 1.0.3. This update is recommended for all Soundtrack Pro customers. Use Software Update or download updates here.

If you create an AppleScript in Soundtrack Pro to normalize audio files, the files are processed without first being analyzed when you run the script. This is due to the way the Normalize process is handled by AppleScript in Soundtrack Pro.

To normalize audio files in Soundtrack Pro, choose **Process > Normalize**.

Keynote 2: QuickTime 7 or later required for H.264 movie playback

This article has been archived and is no longer updated by Apple.

If you use H.264 movies in your Keynote 2 presentations, please note that the computer you're presenting on must have QuickTime 7 or later installed to play the movies. Earlier versions of QuickTime will not play H.264 content.

You can download the latest version of QuickTime from the QuickTime site.

Logic Pro/Express 7: Automation not written in MIDI mode

This article has been archived and is no longer updated by Apple.

When you try to create "region-based" automation in Logic Pro 7 or Logic Express 7, the process may not seem to work. Here's the sequence of events you may experience:

1. In Logic, you set the Automation Mode for an audio channel to "MIDI" to write automation data to a region instead of to a track.
2. You start playback (by clicking the Play button) and move controls in a plug-in that's assigned to the audio channel.
3. You stop playback and notice that Logic didn't record any of the automation.

This happens because when you use MIDI as the Automation Mode, Logic needs a way to write the automation data to a new region. Therefore, to make sure that Logic records your changes, click Record to begin writing the automation data instead of Play.

Other Automation modes allow you to write data by clicking only the Play button.

About the Mac OS X Server 10.4.3 Update

This article has been archived and is no longer updated by Apple.

This software updates Mac OS X Server 10.4.2 to version 10.4.3.

Important: Please Read Before Installing

- You must have an administrator account password that does not contain spaces or Option-keyed characters to install this update. The password may not be left blank (you can change your password if needed).
- You may experience unexpected results if you've installed third-party system software modifications, or if you have modified the operating system through other means. This doesn't apply to normal software installation.
- The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.
- This update can be installed on non-startup volumes, but you should only do this if the current startup volume has already been updated to Mac OS X Server 10.4.3. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are two ways to update to Mac OS X Server 10.4.3: Use Software Update or install from a standalone installer.

Software Update Installation

Software Update may have referred you to this document. For more information on this feature, see "How to Update Your Software."

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

A standalone installer is also available from Apple Downloads. The Mac OS X Server 10.4.3 Update specifically updates version 10.4.2 to version 10.4.3. There is also a "Combo Update" installer available, which will update any version of Mac OS X Server 10.4 to 10.4.3.

Remote Installation

If you need to install the update on a remote computer, you can do so using the "softwareupdate" command-line tool.

Improvements

The following items are some of the improvements in Mac OS X Server 10.4.3 Update:

Apple File Services

- Improves AppleFileServer scalability and stability.
- Better performance when connected AFP clients go to sleep.
- Improved resharing when using identically-named NFS mounts over AFP.
- Improves compatibility with third-party AFP client software for Windows.
- Addresses a potential issue with long filenames.
- Fixes an issue involving use of Active Directory groups with POSIX permissions.
- Improves file locks between AFP and SMB.
- Any Mac OS X client or Server will see the following changes to its behavior as an AFP client when connecting to another AFP server:
    - Resource forks are no longer lost when renaming files stored on an Xsan volume while connected over AFP.
    - Clients copying to or from third-party AFP Servers experience better performance.
    - Improves sleep and wake-from-sleep reliability when using an AFP-based, networked home directory, or when connected to an AFP Server from the "Connect to Server" dialog.
    - Files changed over AFP now have expected modification times.
    - Characters used in filenames now correctly count towards their respective 31 (AFP 2.x) and 255 (AFP 3.x) filename character limits.
    - Japanese file names are no longer garbled when connecting to Microsoft Windows 2003 Server through AFP.

Directory Access Plug-ins

- NIS now honors group memberships beyond the user's primary group.
- Improves system performance when bound to an NIS network.
- Improves LDAP reliability when hosting Windows Domain Member services.
- Addresses an issue in which admin privileges were lost when "BSD Flat File and NIS" authentication was configured in Directory Access.
- Changes to an NIS map now take effect immediately for bound clients.
- Now allows some OIDs to properly view extended schema attributes in Active Directory.
- LDAPv3 plug-in has improved stability.
- Addresses an issue in which clients may stop responding during startup if bound to multiple directory nodes.
- Mac OS X Server is now compatible with a wider range of Active Directory configurations.

DNS

- Addresses an issue with DNS zone controls to allow easier configuration for reverse zones.
- Addresses an issue with DNS Admin support for IP addresses which point to a domain (example.com -> 192.168.0.10).

FTP

- FTP now correctly displays 2-byte character filenames.

Mail Services

- Improves Mail service performance and reliability.
- Now prevents IMAP-only users from accessing mail using POP.
- Addresses authentication issues with applications that are editing SIEVE configurations.
- Addresses an issue that prevented shared mailboxes for users who are members of a nested group.
- Addresses an issue in which mail forwarding configured in Workgroup Manager may not have been correctly delivered; account shortnames must use fully qualified domain names.

Managed Users

- Managed login items now use relative paths for items that reside inside a user's home directory.
- An Active Directory user with a mobile account can now log in after an administrator has reset the user's password and enabled "user must change password at next login."
- Mobile Accounts are now created properly when defined at the Group level in Active Directory with Extended schema.
- Addresses an issue in which an Active Directory Mobile Account may have been locked out due to excessive SMB password queries.
- Managed Preferences configured as "Often" in the Preference Editor (Details view) now apply at every login.
- Local users logging into a managed computer that does not belong to a managed computer list will no longer see the workgroup picker.
- Holding the Option key during local user login now reliably shows the workgroup picker.
- Restricted access to shared printers now behaves correctly.
- Simultaneous login will now be prevented in all instances for Managed Clients. (Note: this does not apply to mobile user accounts.)
- Improves integration of Single Sign On's passing 802.1X credentials to Active Directory environments from the login window.

MySQL

- Upgrades MySQL to version 4.1.13a.
- MySQL starts more reliably during system startup.

NetBoot, NetInstall, and System Imaging

- Improved support in System Image Utility for creation of images from systems with certain interim updates installed.
- Allows NetBoot to be configured on a link aggregate port.
- Now properly prevents the display of invisible files in images created with System Image Utility, as well as on NetBoot clients.

NFS

- Allows for improved handling of unresolved host names.
- A new NFS export option (-32bitclients) that provides better interoperability for some NFS clients that may display only partial contents of exported HFS directories.

Open Directory

- Improves DirectoryService performance and stability.
- Faster group membership updates and faster re-evaluation of group memberships during login.
- Addresses an issue in which changing a user's password type from Open Directory Password to Crypt Password may have unexpected

results.
- Addresses an issue in which Active Directory binding may have failed due to Kerberos domain names that weren't mapped to full DNS names.

Password Server

- Password Server now reuses free Database file space rather than growing the size of the Database.
- Improves Password Server stability.
- Addresses an issue in which a global password reset may have had unexpected results.

Portable Home Directories

- Addresses issues with syncing portable home directories with a user's ~/Library folder.
- Addresses issues in which Active Directory users creating an initial mobile account dropped to Console or encountered home directory creation issues.
- Addresses an issue in which portable home directory configurations may have mounted multiple instances of the same home directory.
- When logging in and creating a Mobile user account, choosing "Never" now prevents the dialog from appearing again on that computer.
- A portable home directory now properly syncs after changing the location of the network home directory.
- Improved messages when logging users into portable home directories from multiple clients.
- Background syncing will now work when the user's network home directory is unavailable while logging in.
- A new computer on which a mobile user is logging in for the first time will no longer pause for up to 20 seconds.
- Documents stored as packages (such as Keynote and Pages documents) will no longer report a conflict when the file is modified locally.

Print Services

- Improves the restart performance of print services.

QTSS

- Resolves an issue in which a client could cause an abnormally large load on the server.
- Resolves an issue that caused some RTSP clients to fail.
- Resolves an issue that occurred when using Instant-On with Fast Start.

RAID

- Improves Software RAID reliability during creation and rebuilding.

Server Admin

- Improves experience when joining Kerberos realms—Kerberos realm information populates automatically.

Server Assistant

- Addresses serial number issues encountered when configuring multiple servers at once.

SMB

- Improves file and byte range locking support for AFP, SMB/CIFS, and NFS file sharing protocols.

Software Update Server

- Improves Software Update Server performance.
- Delivers more reliable notifications and synchronization of package downloads.
- Corrected default status view in the Overview pane of Server Admin.
- Improved sorting in the Updates pane of Server Admin.
- The Updates pane of Server Admin will now reliably indicate which updates would require a restart of the client after install.

Web Services

- Updates Apache 2 to version 2.0.54.
- Lifts the 64 Kilobyte limitation on file downloads in Apache 2.

Weblog

- Update to Blojsom version 2.25, including RSS2 compatibility in Weblog server.
- Improves handling of podcast links, filenames, and attachments.
- Improved authentication to the Weblog server now allows either a full name or alternate short name.
- Now prevents data loss when the session expires.
- Improves handling of international text.

Workgroup Manager

- Faster directory enumeration when searching or applying changes to multiple records.
- Improved batch editing when applying group memberships or updating Open Directory Passwords.
- Improved experience when creating custom home directory paths within subfolders.
- Improved support for adding international phone numbers to a record's Info pane.
- Addresses an issue in which propagating file system permissions from Workgroup Manager may have unexpectedly cleared the Executable bit.
- Addresses an issue that caused an error when creating User accounts within the DefaultLocalNode.
- Group memberships now display correctly in certain situations in which they didn't previously.
- Addresses an issue that caused computers moved from one list to another in Workgroup Manager to appear in both lists.
- Addresses an issue in which users dragged from Workgroup Manager into the Macintosh Manager application may not have behaved correctly.
- Addresses an issue in which the Preference Editor (Details view) may have deleted merged preferences.
- Addresses an issue in which the Preference Editor (Details view) may not have allowed the addition of .GlobalPreferences.
- Preference Editor (Details view) now automatically removes the MAC address when adding a ByHost preference.
- Improved Preference Editor (Details view) behavior when encountering unknown or incorrect Preference Manifest keys.

Xgrid Admin

- Addresses a memory handling issue in the Xgrid agent.
- Corrects inconsistencies in the Xgrid man page.

About the Mac OS X Server 10.4.3 Update (Combo)

This article has been archived and is no longer updated by Apple.

This software updates Mac OS X Server versions 10.4, 10.4.1, and 10.4.2 to Mac OS X Server 10.4.3. It is a "combo" update that combines enhancements delivered with versions 10.4.1 through 10.4.3. If you already have Mac OS X Server 10.4.2, you can download a smaller update to update to version 10.4.3.

Important: Please Read Before Installing

- You must have an administrator account password that does not contain spaces or Option-keyed characters to install this update. The password may not be left blank (you can change your password if needed).
- You may experience unexpected results if you've installed third-party system software modifications, or if you have modified the operating system through other means. This doesn't apply to normal software installation.
- The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.
- This update can be installed on non-startup volumes, but you should only do this if the current startup volume has already been updated to Mac OS X Server 10.4.3. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are two ways to update to Mac OS X Server 10.4.3: Use Software Update or install from the standalone installer.

Software Update Installation

Software Update may have referred you to this document. For more information on this feature, see "How to Update Your Software."

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

A standalone installer is also available from Apple Downloads.

Remote Installation

If you need to install the update on a remote computer, you can do so using the "softwareupdate" command-line tool.

Enhancements delivered with this update

This update delivers many enhancements. Because this is a combo update, it includes enhancements that are delivered with the 10.4.1, 10.4.2, and 10.4.3 updates. You can see the individual enhancement lists for 10.4.1, 10.4.2, and 10.4.3updates.

Motion 2 bonus filters available for download

This article has been archived and is no longer updated by Apple.

Did you know that Apple offers three bonus filters for Motion 2 customers, freely available for download? Just go to the Motion download page and follow the instructions to register and download the additional filter installer (you'll need to provide your serial number to access the downloads). Here's what you'll get.

Bonus Filters

Insect Eye—Maps a repeating hexagonal distortion pattern to an image, mimicking the point of view of an insect.

Movement Blur—Creates blur based on the movement of subjects in the footage itself. This is different than motion blur, which blurs an animated object in the Canvas.

Underwater—Applies an animated distortion to your object, as if it was being viewed through a water surface.

Note: Motion 1 customers should register here for additional filters and generators.

Mac OS X 10.4: Scrolling around an image in Preview

This article has been archived and is no longer updated by Apple.

In Mac OS X 10.4, you can scroll around an image in Preview easily in several different ways (scrolling is only possible when the image doesn't completely fit inside the Preview window):

- Hold down the space bar and your mouse button at the same time, then scroll at will.
- If you have an Apple Mighty Mouse or a third-party mouse with a scroll wheel, you can use the mouse's wheel to scroll around. To scroll horizontally with a third-party mouse, hold the Shift key while scrolling.
- Use your keyboard's arrow keys.
- Drag the scroll bar on the bottom or side of the Preview window.
- On some PowerBooks, you can use the trackpad for scrolling.

Logic Pro/Express 7: Windows that span two displays aren‘t recalled in screenset

This article has been archived and is no longer updated by Apple.

If you set windows in Logic to span across two displays in a custom screenset, they may revert back to only one of the displays when you choose this screenset after using another.

For example, let's say you're working on a dual-display system and you create a screenset in which the Arrange window spans both displays. If you choose a different screenset and then revert back to the original screenset, the Arrange window may only occupy the right display instead of both.

This only happens when you're using the display on your right as your primary display (the menu bar and Dock appear in the right display). To change the primary display status to your left display:

1. Choose **Apple Menu > System Preferences**.
2. Click Displays.
3. Click the Arrangement tab.
4. Drag the white horizontal bar at the top of the right display representation to the left display representation.

This document will be updated as more information becomes available.

Logic Pro 7.1: Follow Tempo not available for an exported region

This article has been archived and is no longer updated by Apple.

When working with audio files that you exported from regions in Logic Pro 7.1, the Follow Tempo option may not always be available in the Region Parameter box (it will appear dimmed). This happens if the original region from which you exported the audio file doesn't start exactly on a quarter note beat.

For example, if you have a region that starts at a timeline position of 2 2 1 1 and export an audio file from it, the resulting file can be set to follow the tempo. However, if you have a region that starts at a timeline position of 2 2 3 1 and export an audio file from it, the resulting file won't be able to follow the tempo.

If you have a region that does not start on a quarter note, move it so that it starts on a quarter note beat before exporting the region. Alternatively, you can leave the region in its original position and export the entire track as an audio file by choosing **File > Export > Track as Audio File**. Then bring the resulting file back into the Arrange window to edit out any unwanted parts.

Anamorphic Motion projects aren‘t displayed correctly when edited into an anamorphic Final Cut Pro sequence

This article has been archived and is no longer updated by Apple.

You can export Final Cut Pro clips and sequences as Motion projects using the Export to Motion Project command. You can also import Motion project files into Final Cut Pro and treat them like video clips. However, if you edit a widescreen anamorphic Motion project into an Anamorphic Final Cut Pro sequence, the image may appear "squeezed" into a 4:3 aspect ratio.

To display the Motion project in the correct 16:9 aspect ratio, do one of the following:

- In the Final Cut Pro Browser window, select the Motion project, then click the space next to it in the Anamorphic column to place a check mark, which assigns the Anamorphic property to it.

- Select the Motion project clip and choose **Edit > Item Properties > Format** (or press Command-9), then place a check mark next to the Anamorphic property for the clip.

- Open the Motion Project clip in the Final Cut Pro Viewer and select the Motion tab. Click to open the disclosure triangle for the Distort parameters, then change the Aspect Ratio parameter from 33.33 to 0.

This document will be updated as more information becomes available.

Motion 2: Noise Dither filter is now called Reduce Banding

This article has been archived and is no longer updated by Apple.

In Motion 2, the filter formerly known as "Noise Dither" in Motion 1 has been renamed as "Reduce Banding." The Reduce Banding filter adds a small amount of noise to the pixels of an object, and can be used to soften the banding seen on 8-bit images with subtle gradients.

.Mac: Images don‘t appear in your HomePage

This article has been archived and is no longer updated by Apple.

If you have a slow Internet connection or if you've moved files around on your iDisk, sometimes your images may no longer appear in your HomePage Photo Album pages. In their place, you may see a "missing image" icon in Safari, Internet Explorer, or Firefox, as follows:

Safari Internet Explorer Firefox

To get your photos back, first try clearing your web browser's cache. The instructions vary slightly, depending on what browser you're using. Here's how to clear the cache in Safari, Internet Explorer, and Firefox:

- **Safari**—From the **Safari** menu, choose **Empty Cache**.
- **Internet Explorer**—From the **Explorer** menu, choose **Preferences**. Under the Web Browser category in the left column, select Advanced. Click the Empty Now button.
- **Firefox**—From the **Firefox** menu, choose **Preferences**. Click the Privacy button in the left column, then click the Clear button next to "Cache."

Note: Please be aware that the instructions may differ for your browser, depending on what version you're using. If the above instructions do not work on your browser, find instructions in the application's Help menu.

If clearing the cache doesn't resolve the issue, try viewing the webpage with a different web browser or on another computer to test. If your images still show up missing, your pictures may have been moved or deleted from their original location.

For your HomePage Photo Album to display photos correctly, image files must remain in the same place on your iDisk with the same file name after you publish a page. If you renamed a picture or renamed a folder that contains pictures on your iDisk, simply changing the name back will resolve the issue. If this doesn't work or you don't remember the original name, republish the affected pages with either HomePage or iPhoto to resolve the issue.

About the Xsan 1.2 Updates

This article has been archived and is no longer updated by Apple.

There are four different software updates available for Xsan 1.2. These updates apply to Mac OS X client and Server versions 10.3.9 and later.

Installation

The following updates are available for Xsan 1.2, which can be installed using Software Update or by downloading a standalone update installer from Apple Downloads:

- **Xsan 1.2 Update for 10.4**
- **Xsan 1.2 Update for 10.3.9**
  Of the two updates above, you only need to install the one that corresponds to your operating system version.
- **Xsan Admin 1.2 Update**
  Required for Xsan 1.2 administration (and is also recommended for Xsan 1.0 administration) and only needs to be installed on admin computers.
- **Xsan 1.2 Uninstaller**

Important Notes- Read Before Continuing

- **Before Installation**
  For the Xsan 1.2 Update for 10.3.9 and the Xsan 1.2 Update for 10.4, you must already be running Xsan 1.0.1 or 1.1. If you're still on Xsan 1.0, **stop now** and update to 1.1 **before** continuing.

- **After Installation**
  To avoid a certain stability issue over the long term, you should run the cvfsck command on each Xsan volume, after the MDCs have been updated with Xsan 1.2 Update for 10.3.9 or Xsan 1.2 Update for 10.4. **Before continuing**, please see the full explanation here.

- **Metadata Controller (MDC) software version**
  Whether you are running Panther or Tiger systems, your MDCs must always have software versions (both Xsan and Mac OS) that are equal to or more recent than the most recent client versions. Specifically, that means: If any client in your Xsan network is running Xsan 1.2 on Mac OS X 10.4.3 or later, then your metadata controllers (MDCs) must also be updated to Xsan 1.2 on Mac OS X 10.4.3 or later; If any client in your Xsan network is running Xsan 1.2 on Mac OS X 10.3.9, then the MDC must run Xsan 1.2 on 10.3.9.

Software Update Installation

Software Update may have referred you to this document. For more information on using this feature, see "Mac OS X: Updating your software ."

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Standalone Installer

A standalone installer is also available from Apple Downloads.

Remote Installation

If you need to install the update on a remote computer, you can do so using the "softwareupdate" command-line tool.

System Hardware Requirements

- Xserve or Xserve G5
- Power Mac G4 (dual 800MHz or faster)
- Power Mac G5 (any model)

Storage Network Requirements

- Apple Fibre Channel PCI, PCI-X, or PCI Express Card

Xsan 1.2 Update for 10.4.3 or later

This update delivers overall improved reliability for Xsan and is recommended for all systems running 10.4.3 or later. It includes fixes for:

- Improving AFP performance when resharing Xsan volumes
- More accurate file permissions when sharing Xsan volumes via AFP
- Accessing Xsan volumes larger than 16 terabyte in size
- Greater server stability when resharing Xsan volumes via NFS
- Handling quotas with no associated user or group name
- Maintaining access to Xsan volumes when metadata controller failovers occur
- Providing metadata controller services to 10.3.9 and 10.4 systems running Xsan 1.2
- Operating Xsan in environments with a mix of 10.3.9 and 10.4 systems
- Reporting the creation dates for Xsan Volumes

Software requirements for this update are:

- Mac OS X Server 10.4.3 or later
- Mac OS X 10.4.3 or later
- Xsan 1.0.1 or 1.1

Xsan 1.2 Update for 10.3.9

This update delivers overall improved reliability for Xsan and is recommended for all systems running 10.3.9. It includes fixes for:

- Greater server stability when resharing Xsan volumes via NFS
- Handling quotas with no associated user or group name
- Maintaining access to Xsan volumes when metadata controller
- Operating Xsan in environments with a mix of 10.3.9 and 10.4 systems

Software requirements for this update are:

- Mac OS X Server 10.3.9
- Mac OS X 10.3.9
- Xsan 1.0.1 or 1.1

Xsan Admin 1.2 Update

This update delivers overall improved reliability for remotely administering, configuring and maintaining Xsan deployments. It includes fixes for:

- Working with multiple Xsan metadata controllers in a heterogeneous environment
- Labeling Fibre Channel LUNs and creating new Xsan volumes
- Displaying progress messages while performing lengthy operations
- Preventing manually modified configuration settings from being overwritten during a save
- Accurately reporting Fibre Channel multipathing errors

Xsan 1.2 Uninstaller

This uninstaller will remove Xsan from your computer. It will also remove the Xsan Admin Application and documentation files.

Before removing Xsan, you should back up all of your data and volumes, and unmount all Xsan volumes.

Documentation

Xsan 1.2 Administrators can continue to reference the Xsan 1.1 documentation, which you can get here.

Published Date: Oct 7, 2016

Mac OS X Server: "Invalid serial number" message appears after using Xsan 1.1 uninstaller

This article has been archived and is no longer updated by Apple.

The Xsan 1.1 CD includes an "Uninstall Xsan.pkg" file that, if run, will remove files that are essential for serial number verification in Mac OS X Server. If this happens, the next time you restart the server, Server Admin will report that the server is using an invalid serial number.

If you need to uninstall Xsan 1.1 from a computer running Mac OS X Server, or if you've already run the Uninstall Xsan.pkg from the Xsan 1.1 CD, please contact AppleCare for assistance.

Final Cut Pro: Avoid enabling audio preview when capturing DVCPRO HD over FireWire

This article has been archived and is no longer updated by Apple.

When capturing DVCPRO HD footage over FireWire in Final Cut Pro, avoid enabling the Preview checkbox for audio. If you select this checkbox, audio artifacting may occur or Final Cut Pro may unexpectedly quit.

As a workaround, monitor audio directly from your video deck during capture.

Solution

Update to Final Cut Pro 5.1.2 or later.

Published Date: Oct 7, 2016

Final Cut Pro 5: If language is set to Japanese, duplicate Capture Presets if you can‘t capture video

This article has been archived and is no longer updated by Apple.

If you're using Final Cut Pro 5 with Japanese as the top language in the International pane of System Preferences, in some cases you may be unable to capture video as expected when using a standard Easy Setup. In such cases, you may be able to control your video deck, but you see a "Preview Disabled" message in the Log and Capture window instead of video. You may also see that the frame rate and digitizer type are set incorrectly in the Capture Preset.

If this happens to you, create a duplicate of the Capture Preset and then make adjustments to that copy to enable capture.

For example, if you're trying to capture DVCPPRO HD 1080i60 footage from a Panasonic AJ-HD1200A over FireWire, make a copy of the 1080i60 DVCPRO HD Easy Setup, then change the settings for anything that displays incorrectly, as shown here:

Reinstalling QuickTime may also address similar issues. Click here for more information.

For more information on creating and modifying Capture Presets, see the Final Cut Pro User's Manual, located in the Help menu.

This document will be updated as more information becomes available.

Published Date: Feb 20, 2012

Mac OS X 10.4: Some PostScript printing jobs may deliver unexpected results

This article has been archived and is no longer updated by Apple.

Some PostScript printers feature advanced configuration options made available through their PPD (PostScript printer description), but Mac OS X 10.4 Tiger may not immediately update the settings you make before printing. For example, you may have chosen to print in Grayscale/Black & White, but get a color printout instead.

To resolve this issue, review the selections in the Printer dialog's print job summary (choose **Summary** from the **Copies & Pages** pop-up menu) before you click the Print button. If you need to make changes, edit the settings as necessary, then print.

Additional information

Most printers can't support every available option, so their PPD files contain code that specifies those dependencies. However, the Apple Printer Features PDE (Printing Dialog Extension) may not correctly handle these dependencies, so sometimes your chosen settings will be out of sync with the actual settings sent with the print job.

This document will be updated as more information becomes available.

About Security Update 2005-007

This article has been archived and is no longer updated by Apple.

This document describes Security Update 2005-007, which can be downloaded and installed using Software Update, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred, and any necessary patches or releases are available. To learn more about Apple Product Security, visit the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to Use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Security Update 2005-007

- **Apache 2**

  CVE-ID: CAN-2005-1344

  Available for: Mac OS X Server v10.3.9

  Impact: The htdigest program contains a buffer overflow, which, if used improperly in a CGI application, could allow a remote system compromise.

  Description: The htdigest program contains a buffer overflow, and could be used in a CGI application to manage user access controls to a web server. This update fixes the buffer overflow in htdigest. Apple does not provide any CGI applications that use the htdigest program. Apache 2 ships only with Mac OS X Server, and is off by default. This issue was fixed for Apache 1.3 in Security Update 2005-005. Credit to JxT of SNOsoft for reporting this issue.

- **Apache 2**

  CVE-ID: CAN-2004-0942, CAN-2004-0885

  Available for: Mac OS X Server v10.3.9

  Impact: Multiple security issues in Apache 2.

  Description: The Apache Group fixed two vulnerabilities between versions 2.0.52 and 2.0.53 (the Apache Group security page for Apache 2 is located at http://httpd.apache.org/security/vulnerabilities_20.html). Apache 2 is updated to version 2.0.53 (the previous version was 2.0.52). Apache 2 ships only with Mac OS X Server, and is off by default.

- **Apache 2**

  CVE-ID: CAN-2004-1083, CAN-2004-1084

  Available for: Mac OS X Server v10.3.9, Mac OS X Server v10.4.2

  Impact: Apache 2 example configurations do not fully block access to resource forks, ".ht" files, or ".DS_Store" files.

  Description: Apache 2 ships only with Mac OS X Server, and is off by default. It is important that administrators who enable this server manually are aware of the files that should be blocked to avoid security exposures. A default Apache 2 configuration blocks access to files starting with ".ht" in a case-sensitive way. The Apple HFS+ filesystem isn't case-sensitive when performing file access, and maps resource forks of files to path names. The Finder may also create .DS_Store files containing the names of files in locations used to serve webpages. This update modifies the sample Apache 2 configuration to show how to restrict access to these files and resource forks. This issue was fixed for Apache 1.3 in Security Update 2004-12-02. Additional information is available here.

- **AppKit**

  CVE-ID: CAN-2005-2501

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: Opening a malicious, rich text file could lead to arbitrary code execution.

  Description: A buffer overflow in the handling of maliciously crafted rich text files could lead to arbitrary code execution. This update prevents the buffer overflow from occurring.

- **AppKit**

  CVE-ID: CAN-2005-2502

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: Opening a maliciously crafted Microsoft Word .doc file could result in arbitrary code execution.

  Description: A buffer overflow in AppKit that is responsible for reading Word documents could allow arbitrary code execution. Only applications such as TextEdit that use AppKit to open Word documents are vulnerable. Microsoft Word for Mac OS X is not vulnerable. This update prevents the buffer overflow.

- **AppKit**

  CVE-ID: CAN-2005-2503

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: A malicious user with physical access to a system could create additional local accounts.

  Description: A malicious user who has full physical access to a system could create additional accounts by forcing an error condition. This update prevents the error conditions from occurring at the login window.

- **Bluetooth**

  CVE-ID: CAN-2005-2504

  Available for: Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: The System Profiler information about whether or not a Bluetooth device requires authentication is misleading.

  Description: Selecting "Require pairing for security" in Bluetooth preferences correctly sets the device to require authentication, but in System Profiler the device is labeled with "Requires Authentication: No." This update changes System Profiler to accurately reflect the Bluetooth security settings. This issue does not affect systems prior to Mac OS X 10.4. Credit to John M. Glenn of San Francisco for reporting this issue.

- **CoreFoundation**

  CVE-ID: CAN-2005-2505

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9

  Impact: Buffer overflow via a command line argument for applications using the CoreFoundation framework.

  Description: The incorrect handling of a command line argument within the CoreFoundation framework can result in a buffer overflow that may be used to execute arbitrary code. This issue has been addressed by improved handling of command line arguments. This issue does not affect Mac OS X 10.4. Credit to David Remahl of www.remahl.se/david for reporting this issue.

- **CoreFoundation**

  CVE-ID: CAN-2005-2506

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: Passing a malformed date to the CoreFoundation framework can cause applications to stall.

  Description: The parsing of Gregorian dates in the CoreFoundation framework is vulnerable to an algorithmic complexity attack that could result in a denial of service. This update modifies the algorithm to parse all valid dates within a fixed processing time. Credit to David Remahl of www.remahl.se/david for reporting this issue.

- **CUPS**

  CVE-ID: CAN-2005-2525, CAN-2005-2526

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: The CUPS printing service will not print unless it is restarted.

  Description: When handling multiple, simultaneous, print jobs, the CUPS printing service can stop printing because it incorrectly tracks open file descriptors. In addition, if CUPS receives a partial IPP request and a client terminates the connection, the printing service will then consume all available CPUs. If the service is restarted, then printing will resume. This update corrects the handling of multiple, simultaneous

print jobs and partial requests.

- **Directory Services**

  CVE-ID: CAN-2005-2507

  Available for: Mac OS X Server v10.3.9, Mac OS X Server v10.4.2

  Impact: A buffer overflow in Directory Services could lead to remote execution of arbitrary code.

  Description: A buffer overflow in the handling of authentication can lead to arbitrary code execution by a remote attacker. This update prevents the buffer overflow from occurring.

- **Directory Services**

  CVE-ID: CAN-2005-2508

  Available for: Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: The privileged tool dsidentity has several security flaws that can result in non-administrative users adding or removing identity user accounts in Directory Services.

  Description: This update addresses this issue by removing dsidentity and its documentation. This issue does not affect systems prior to Mac OS X 10.4. Credit to kf_lists[at]digitalmunition[dot]com and Neil Archibald of Suresec LTD for reporting this issue.

- **Directory Services**

  CVE-ID: CAN-2005-2519

  Available for: Mac OS X Server v10.3.9

  Impact: Insecure temporary file creation could lead to a local privilege escalation.

  Description: slpd insecurely creates a root-owned file in the world-writable /tmp directory. This update moves the creation of the file to a directory that is not world-writable. This issue does not affect Mac OS X v10.4.

- **HItoolbox**

  CVE-ID: CAN-2005-2513

  Available for: Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: VoiceOver may read content from secure input fields.

  Description: Under certain circumstances, secure input fields may be read by VoiceOver services. This update stops VoiceOver from exposing the content of these fields. This issue does not affect systems prior to Mac OS X v10.4.

- **Kerberos**

  CVE-ID: CAN-2004-1189

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9

  Impact: An authenticated user could execute arbitrary code on the KDC host, compromising a Kerberos realm.

  Description: A heap buffer overflow in password history handling code could be exploited to execute arbitrary code on a Key Distribution Center (KDC). This issue does not affect Mac OS X 10.4. Credit to the MIT Kerberos team for reporting this issue. Their advisory for this vulnerability is located at http://web.mit.edu/kerberos/advisories/MITKRB5-SA-2004-004-pwhist.txt

- **Kerberos**

  CVE-ID: CAN-2005-1174, CAN-2005-1175, CAN-2005-1689, CERT VU#885830 VU#259798 VU#623332

  Available for: Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: Multiple buffer overflow vulnerabilities could result in denial of service or remote compromise of a KDC.

  Description: This update upgrades Kerberos for Macintosh to version 5.5.1, which contains fixes for this issue. The Kerberos security advisories for these issues are located at http://web.mit.edu/kerberos/www/advisories/

- **Kerberos**

CVE-ID: CAN-2005-2511

Available for: Mac OS X v10.4.2, Mac OS X Server v10.4.2

Impact: Kerberos-enabled logins when using LDAP can result in root compromise.

Description: When Kerberos authentication is enabled in addition to LDAP, it was possible to gain access to a root Terminal window. Kerberos authentication has been updated to prevent this situation. This issue does not affect systems prior to Mac OS X v10.4. Credit to Jim Foraker of Carnegie Mellon University and colleagues at MacEnterprise.Org for reporting this issue.

- **loginwindow**

  CVE-ID: CAN-2005-2509

  Available for: Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: A user can gain access to other logged-in accounts if Fast User Switching is enabled.

  Description: An error in the handling of Fast User Switching can allow a local user who knows the password for two accounts to log into a third account without knowing the password. This update corrects the authentication error. This issue does not affect systems prior to Mac OS X 10.4. Credit to Sam McCandlish for reporting this issue.

- **Mail**

  CVE-ID: CAN-2005-2512

  Available for: Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: Loss of privacy due to Mail loading remote images in HTML emails.

  Description: When Mail.app is used to print or forward an HTML message, it will attempt to load remote images even if a user's preferences disallow it. As this network traffic is not expected, it may be considered a privacy leak. This update addresses the issue by having Mail.app only load remote images in HTML messages when the preferences allow it. This issue does not affect systems prior to Mac OS X v10.4. Credit to Brad Miller of CynicalPeak and John Pell of Foreseeable Solutions for reporting this issue.

- **Mail**

  CVE-ID: CAN-2005-2745

  Available for: Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: Using Kerberos Version 5 for SMTP authentication Mail.app may disclose sensitive information.

  Description: When using SMTP authentication with Kerberos Version 5, Mail.app may append un-initialized memory to a message. This update addresses the issue by updating Mail.app. Credit to the MIT Kerberos team for reporting this issue. This issue was resolved in Mac OS X v10.3.9 by Security Update 2005-008.

- **MySQL**

  CVE-ID: CAN-2005-0709, CAN-2005-0710, CAN-2005-0711

  Available for: Mac OS X Server v10.3.9

  Impact: Multiple vulnerabilities in MySQL, including arbitrary code execution by remote authenticated users.

  Description: MySQL is updated to version 4.0.24 to address several issues. This does not affect systems running Mac OS X v10.4 as Tiger shipped with MySQL version 4.1.10a, which is patched against this issue. The MySQL announcement for version 4.0.24 is located at http://dev.mysql.com/doc/mysql/en/news-4-0-24.html

- **OpenSSL**

  CVE-ID: CAN-2004-0079, CAN-2004-0112

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: Multiple denial of service vulnerabilities in OpenSSL.

  Description: OpenSSL is updated to version 0.9.7g to address several issues. The OpenSSL advisory for these issues is located at http://www.openssl.org/news/secadv_20040317.txt

- **ping**

CVE-ID: CAN-2005-2514

Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9

Impact: A buffer overflow could result in local privilege escalation and arbitrary code execution.

Description: The ping utility is vulnerable to a buffer overflow. This update prevents the buffer overflow from occurring. This issue does not affect systems running Mac OS X v10.4. Credit to Ilja van Sprundel of Suresec LTD for reporting this issue.

- **QuartzComposerScreenSaver**

  CVE-ID: CAN-2005-2515

  Available for: Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: Users could open webpages while the RSS Visualizer screen saver is locked.

  Description: It is possible to open displayed links from the RSS Visualizer in the background when the screen saver is configured to require a password. This update prevents the RSS Visualizer screen saver from opening a URL if a password is required to exit the screen saver. Credit to Jay Craft of GrooVault Entertainment, LLC for reporting this issue.

- **Safari**

  CVE-ID: CAN-2005-2516

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: Clicking on a link in a maliciously-crafted rich text file in Safari could lead to arbitrary command execution.

  Description: Safari renders rich text content using code that allows URLs to be called directly, which bypasses the normal browser security checks. This update addresses the issue by handling all links in rich text through Safari.

- **Safari**

  CVE-ID: CAN-2005-2517

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: Information can be inadvertently submitted to the wrong site.

  Description: When submitting forms in Safari on an XSL formatted page, data is sent to the next page browsed. This update addresses the issue by ensuring that form contents are submitted correctly. Credit to Bill Kuker for reporting this issue.

- **Safari**

  CVE-ID: CAN-2005-2524

  Available for: Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: Maliciously crafted web archives could potentially allow cross-site scripting.

  Description: It is possible to view web archives served from remote sites in Safari. Maliciously crafted web archives may be rendered as content from sites they did not server them. This update prevents remote web archives from being loaded. Safari web archives were introduced in Safari 2.0. This issue was resolved in Mac OS X v10.3.9 by Security Update 2005-008.

- **SecurityInterface**

  CVE-ID: CAN-2005-2520

  Available for: Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: Recently-used passwords are visible via the password assistant.

  Description: The password assistant provides an easy mechanism for selecting a good password. If an administrator uses the password assistant while adding multiple accounts, they will be able to view previously suggested passwords. This only occurs when password assistant is used more than once from the same process. This update addresses the issue by resetting the suggested password list each time the password assistant is displayed. This issue does not affect systems prior to Mac OS X v10.4. Credit to Andrew Langmead of Boston.com for reporting this issue.

- **servermgrd**

CVE-ID: CAN-2005-2518

Available for: Mac OS X Server v10.3.9, Mac OS X Server v10.4.2

Impact: A buffer overflow in servermgrd could lead to remote execution of arbitrary code.

Description: A buffer overflow in the handling of authentication can lead to arbitrary code execution by a remote attacker. This update prevents the buffer overflow from occurring.

- **servermgr_ipfilter**

  CVE-ID: CAN-2005-2510

  Available for: Mac OS X Server v10.4.2

  Impact: Certain firewall policies created with the Server Admin tool are not always written to the Active Rules.

  Description: When using multiple subnets and Address Groups, the firewall rules are not always written to the Active Rules, depending on the order in which the IP subnets were entered into the Address Group. This update addresses the issue by generating correct rules irrespective of any ordering within the Address Group. This issue does not affect systems prior to Mac OS X 10.4. Credit to Matt Richard of Franklin & Marshall College and Chris Pepper of The Rockefeller University for reporting this issue.

- **SquirrelMail**

  CVE-ID: CAN-2005-1769, CAN-2005-2095

  Available for: Mac OS X Server v10.3.9, Mac OS X Server v10.4.2

  Impact: Multiple vulnerabilities in SquirrelMail, including cross-site scripting and SquirrelMail user preference modification.

  Description: There are multiple vulnerabilities in SquirreMail prior to version 1.4.5. These fixes address cross-site scripting and an exposure that may allow attackers to modify user preferences. This update upgrades SquirrelMail to version 1.4.5. For more information, see http://www.squirrelmail.org.

- **traceroute**

  CVE-ID: CAN-2005-2521

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9

  Impact: A buffer overflow could result in local privilege escalation and arbitrary code execution.

  Description: The traceroute utility is vulnerable to a buffer overflow. This update prevents the buffer overflow from occurring. This issue does not affect systems running Mac OS X v10.4. Credit to Ilja van Sprundel of Suresec LTD for reporting this issue..

- **WebKit**

  CVE-ID: CAN-2005-2522

  Available for: Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: Clicking on a link in a maliciously-crafted PDF file in Safari could lead to arbitrary command execution.

  Description: Safari renders PDF content using code that allows URLs to be called directly, which bypasses the normal browser security checks. This Safari issue does not affect systems prior to Mac OS X v10.4. This update addresses the issue by handling all links in PDF through Safari.

- **Weblog Server**

  CVE-ID: CAN-2005-2523

  Available for: Mac OS X Server v10.4.2

  Impact: Multiple cross-site scripting issues in Weblog Server.

  Description: Several cross-site scripting problems were discovered in the Weblog Server. This update improves the sanitizing of user input before redisplaying it. This issue does not affect systems prior to Mac OS X v10.4. Credit to Donnie Werner (wood@exploitlabs.com) of Exploitlabs.com and Atsushi MATSUO for reporting this issue.

- **X11**

CVE-ID: CAN-2005-0605

Available for: Mac OS X v10.4.2, Mac OS X Server v10.4.2

Impact: A buffer overflow could result in arbitrary code execution.

Description: An error in LibXPM may allow attackers to execute arbitrary code via a negative bitmap_unit value that leads to a buffer overflow. This issue does not affect systems prior to Mac OS X v10.4.

- **zlib**

CVE-ID: CAN-2005-2096, CAN-2005-1849

Available for: Mac OS X v10.4.2, Mac OS X Server v10.4.2

Impact: Applications linked against zlib are susceptible to denial of service attacks and potential execution of arbitrary code.

Description: By carefully crafting a corrupt compressed data stream, an attacker can overwrite data structures in a zlib-using application, resulting in denial of service or possible arbitrary code execution. This update address the issue by updating zlib to version 1.2.3.

Logic Pro and Logic Express Resources

This article has been archived and is no longer updated by Apple.

Support
In the United States and Canada, all new registered users of Logic Pro and Logic Express receive 90 days of complimentary software support via telephone from the date of purchase. In addition, Apple offers a range of professional support options.

Logic Pro and Logic Express Discussion Boards
Our Logic discussion boards are filled with experienced users. Ask a question, answer a question, or simply read what other Logic users have to say.

Visit the Logic Pro and Logic Express Discussions boards

Logic Support Sites
Apple's Support website is filled with the best information for Logic Pro and Logic Express users. On this site, you can:

- Search for helpful Knowledge Base articles.
- Troubleshoot an issue
- Download software updates for Logic

Go to the Logic Pro Support website
Go to the Logic Express Support website

Logic Help
The built-in Help menu gives you direct access to a searchable Logic Pro or Logic Express user manual that can prove invaluable in assisting you with searching for information, such as how to set up and configure your audio devices, how a particular editing tool works, or how to use the features of Logic Pro or Logic Express 7.

To access this help guide in Logic Pro:

Choose Help > Logic Pro Reference

To access this help guide in Logic Express:

Spotlight: Opening an item‘s enclosing folder

This article has been archived and is no longer updated by Apple.

Did you know that you can view an item's enclosing folder (and all of its content) directly in Spotlight (a Mac OS X 10.4 Tiger feature)? Just Command-click the item in the Spotlight search results window to view it in a Finder window!

Here's another way: Click Show All in the Spotlight search results list, select the item of interest in the resulting window, then press Command-R.

Or, in this same Show All window, Control-click (or right-click if you have a multi-button mouse) the item of interest and choose **Reveal in Finder** from the shortcut menu.

These methods work for most files, but not with Mail messages that appear in Spotlight search results (because Mail messages aren't stored the same way as files in the Finder). However, if you double-click a Mail message in a Spotlight list, the email opens in Mail and displays a "Show in Mail Viewer" link in the upper-right corner. When you click the link, Mail will show you which mailbox your message is in.

DVD Studio Pro: No dual-layer break point information when writing to disc image.

This article has been archived and is no longer updated by Apple.

DVD Studio Pro gives you the option to build and then save your DVD project to your system's hard disk. If you use this option to create a disc image (.img) of a DVD-9 (dual-layer) DVD, the resulting disc image will not contain any break point information—even if you specified it in the Disc/Volume tab of the Disc Inspector.

For more information, choose **Help > DVD Studio Pro User Manual** in DVD Studio Pro.

Published Date: Oct 7, 2016

DVD Studio Pro: Installer stops responding during installation

This article has been archived and is no longer updated by Apple.

When you install DVD Studio Pro (or the application as part of Final Cut Studio), the Installer progress bar may stop moving during the DVD Studio Pro 4 templates installation, reporting that the installation is 98-100 percent complete. Despite the appearance that the process has stalled, the installation is actually continuing.

Depending on the speed of the components in your computer, this part of the DVD Studio Pro or Final Cut Studio installation can take up to an hour to complete. If you force quit the Installer, the templates won't be correctly installed (if this happens, simply run the DVD Studio Pro Installer again).

If you would like confirmation that the Installer is still working, open Activity Monitor (find it in /Applications/Utilities) and inspect the Installer process.

iPhoto 5.0.4 or later: Grayscale images appear inverted.

This article has been archived and is no longer updated by Apple.

A black-and-white (grayscale) image looks normal when viewed in organize view, but inverted when you open it full size.

This can happen in iPhoto 5.0.4 or later with grayscale photos that include an embedded color matching profile. To work around this issue, you might consider removing the profile from the image if you do not plan to use it.

One way to remove the profile from the image is to use an AppleScript included with Mac OS X 10.4:

1. Locate the AppleScript folder inside your Applications folder, and open AppleScript Utility.
2. Select the checkboxes for "Show Script Menu in menu bar" and "Show Library scripts." Notice the S-shaped Script menu that now appears in your menu bar.
3. In iPhoto, go to Organize view.
4. - Locate the photo(s) you want to alter.
5. From the **Script** menu, choose **Colorsync > Remove profile from image**.
6. When prompted, click OK.
7. When asked which image you want to alter, drag the image thumbnail from the iPhoto window to the Choose a File dialog. The contents of the dialog should change to the filename of your image.
8. Click the Choose button.
9. When asked if you want to remove the profile, click OK.

The photo should now display properly in iPhoto 5.0.4 or later.

iSync: Deleting a contact from a Motorola phone may not remove it from Address Book

This article has been archived and is no longer updated by Apple.

If you delete a contact from your Motorola phone and then sync the phone with your computer, iSync may not fully remove your deleted contact from Address Book. The contact may still exist, but without a phone number, for example.

This can happen because of the way contacts are stored on the Motorola phone. To resolve the issue, simply delete the partial contact from Address Book after syncing.

Mac OS X 10.4 Tip: Create a Smart Group in Address Book to help you locate contacts without phone numbers—that is, contacts you might want to delete.

iPhoto: Pictures may be trimmed during bookbinding

This article has been archived and is no longer updated by Apple.

As a normal part of the bookbinding process, a binder trims each edge of a page so that the assembled book fits together smoothly.

Whenever you order an iPhoto book with full bleed images (those that go to the very edge of a page), the final bound image may contain a little more or less of the original image at any given edge than what you saw on your screen. For example, you may lose a portion of your image at the spine (known as the "gutter"), while gaining a little bit at the outside edge. Though iPhoto approximates the final output as much as possible, the normal margin of error in the publishing process precludes a 100 percent predictable result.

For this reason, when you prepare your images for an iPhoto book, you should err toward cropping photos a little bit loose rather than cropping in tight. For images that you've shot very tightly in camera (those that won't look good with trimming), select page designs that aren't full bleed.

As you lay out your book, always stop to think about how a page may get trimmed for a moment, and edit your images accordingly—you'll be happier with the results when you see the finished product.

Mac OS X 10.3, 10.4: Cannot open Photoshop files after Archive and Install installation

This article has been archived and is no longer updated by Apple.

After performing an Archive and Install installation of Mac OS X 10.3 or 10.4, you might not be able to open an image file by dragging and dropping it onto an Adobe Photoshop icon, nor open a Photoshop file by double-clicking it (Photoshop opens, but the file does not). Using the Finder's Contextual menu choice "Open With" on a file to open it in Photoshop may not work either.

As a workaround, open the file(s) by choosing **Open** from the Photoshop **File** menu.

For more information and solutions, see Adobe support document 329996.

DVD Studio Pro: Templates without buttons won‘t work when creating a chapter index

This article has been archived and is no longer updated by Apple.

If you create a custom menu template that doesn't contain any buttons, you will not be able to choose it for use when you create a chapter index in DVD Studio Pro 4.

For example, when you create a chapter index by dragging a clip from the Asset list to the Menu Editor and choosing **Create Chapter Index - Make Connections** from the Drop Palette, a dialog appears from which you can choose a template for your newly created menu. However, you will not be able to select any custom template that lacks buttons.

iSync: Use only one connection method per phone

This article has been archived and is no longer updated by Apple.

Some phones allow you to sync information with iSync through either USB or Bluetooth. When you set up your phone, you'll need to select which method to use in iSync.

Please be aware that you cannot switch back and forth between USB and Bluetooth when syncing your phone. iSync will only use the method you selected during set-up to establish a connection to your phone.

If you later change your mind and want to use the other connection type, you must remove the phone from iSync, then add it again and select the connection method you prefer.

About default optical drive burning speeds

This article has been archived and is no longer updated by Apple.

The speed at which your computer's optical drive burns a disc can vary depending on what type of media you're using. For example, your PowerBook G4 computer's SuperDrive may have a maximum 8x DVD burn speed, but if the drive can't determine whether a disc is able to handle that speed, it will burn at the drive's minimum speed for the media, to ensure that the burn is successful.

When you insert a blank disc, it's not actually completely blank. Recordable and rewritable CDs and DVDs are manufactured with a small amount of written "pregroove" data that contains various disc attributes, including the disc type, part number, manufacturer, the kind of dye used, its writable capacity, rated write speed, and other items. This data resides in a very small area on the disc that is not part of the user-writable area.

The optical drive reads this data to determine how it should handle the disc. If the the optical drive doesn't recognize the media type as being burnable at its maximum speed, the drive speed will default to its slowest setting. This protects the burn reliability so you don't end up with unreadable discs that are only useful as drink coasters.

In addition, be aware that maximum burn speeds are reached toward the outer portions of the disc, which hold only a fraction of the disc's total writable area. Since data is written from the inside to the outer edge of the disc, the drive will not reach the maximum burn speed if you burn a disc with only a small amount of data because the written area doesn't approach the outer edge of the disc.

Note: Apple DVD-R media is manufactured to exacting specifications, and has been tested to burn at maximum rated speeds.

For more information about the factors involved in optical drive burning speeds, see "About optical disc drive burning and write speeds."

How to publish a podcast on the iTunes Store

This article has been archived and is no longer updated by Apple.

If you're looking to gain fame in the iTunes Store world, you can submit your own podcast to the iTunes Store—it's easy! Before you begin, make sure that you're using iTunes 4.9 or later, and that you have the URL of the podcast you want to publish handy.

When you're ready, simply click here, and iTunes will take you to the podcast submission page.

Alternatively, you can navigate to the submission page this way:

1. Open iTunes.
2. Click the iTunes Store icon in the Source list.
3. From the **Choose Genre** pop-up menu, choose **Podcasts**.
4. Click the big "Publish a Podcast" button in the middle of the screen.

Note: The iTunes team reviews each podcast submission. Depending on demand, it may take a week or two before your podcast is added.

iTunes Store: How to update or block your podcast, or report a concern about other podcasts

This article has been archived and is no longer updated by Apple.

Podcast owners

If you have a podcast published on the iTunes Store, you can update your podcast by changing the data in your RSS feed. See "How to Publish a Podcast on the iTunes Store" to learn about the extended podcasting RSS specification for iTunes, and how to tag data. If you need to block your podcast from iTunes for any reason, you'll find information to do this in the article as well.

Podcast listeners

If you're not the podcast owner but would like to alert Apple about a particular podcast, please use the "Report a Concern" link (located below the Podcast Description) to tell us more about the issue.

Published Date: Oct 7, 2016

iTunes Store: Can‘t publish a podcast

This article has been archived and is no longer updated by Apple.

Sometimes the iTunes Store can't publish certain podcasts. If you've submitted a podcast using the "Publish a Podcast" page but haven't seen it published yet, sit tight. The iTunes team reviews each podcast submission. Depending on demand, it may take a week or two before the podcast gets published.

Additionally, here are some other reasons why a podcast might not get published:

- The podcast's RSS feed was not available.
- The podcast's RSS feed timed out.
- The podcast's RSS feed could not be validated.

If you are the podcast owner, make sure that your podcast is available on the Internet. Your podcast's RSS feed should also conform to the iTunes extended podcast RSS specification.

If you are not the podcast owner, please contact the podcast owner and direct them to our specification page.

Compressor 2: Log in to service nodes to distribute processing

This article has been archived and is no longer updated by Apple.

Compressor 2 can accelerate processing by distributing the work to multiple computers. If you're using an Apple QMaster cluster for distributed processing, a user must be logged in to each Compressor service node (a computer providing Compressor-distributed processing services) for full functionality. If a service node displays the login screen, that computer will be bypassed in the processing distribution.

For more information on distributed processing, open Compressor and choose **Help > Distributed Processing Setup**.

Power Mac G5 (Late 2004) 1.8GHz models stop responding randomly

This article has been archived and is no longer updated by Apple.

Some 1.8 GHz models of Power Mac G5 (Late 2004) computers may experience any of the following symptoms:

- The computer may freeze when performing certain video-intensive tasks for extended periods of time, such as a full screen slideshows, QuickTime playback, or some games.
- The optical drive may not eject when you've been using the computer for about two hours.
- Internet Connect may become unresponsive when you've been using the computer for about two hours. (This issue can affect either internal or external modems that use PPP as well as DSL modems that connect using the PPPoE protocol.)
- Attached displays may not wake up properly after the computer, running Mac OS X 10.4, has been sleeping for an extended period of time. The computer seems to wake up, but the display doesn't.

A firmware update is available to address the symptoms described in this article. The Power Mac G5 System Firmware Update is only for the 1.8 GHz, 600MHz bus single-processor Power Mac G5 (Late 2004) computer and requires Mac OS X 10.3.9 or Mac OS X 10.4.3 or later. Additional information about the firmware update and requirements are included with the download.

The Power Mac G5 (Late 2004) System Firmware Update for 10.3.9 and the Power Mac G5 (Late 2004) System Firmware Update for 10.4.3 is available for download. If you are using an earlier version of Mac OS X 10.3 or Mac OS 10.4, update the Mac OS from Apple Software Downloads.

Mac OS X: Using email aliases in Mail

This article has been archived and is no longer updated by Apple.

Do you have multiple email addresses that are "aliases" to a central email account? If you do, you can configure Mail in Mac OS X so that it can easily get and send email from all of your addresses. Here's how.

Note: An *alias* email address is an account in which all email sent to it automatically goes to a master email address. This is not the same thing as having different email addresses that aren't automatically tied to a central address.

Important: Do not use these steps for .Mac email aliases. Mail will automatically retrieve email from any aliased .Mac email account. When composing a new message to send, .Mac aliases are available from the Account pop-up menu in the compose window.

1. In Mail, choose **Preferences** from the **Mail** menu.
2. Click Accounts.
3. Select your master account (the one to which email from your alias addresses gets sent).
4. Click Account Information and in the Email Address field, add all of the account's associated alias addresses, each separated by a comma.

5. Save your changes.

Now when you get email, Mail will collect messages sent to your alias accounts (along with email sent to your master account), and put it all in a single Inbox. You can also send email from any alias account by choosing the desired address from the **Account** pop-up menu in a new message window.

Logic Pro/Express: Sometimes notes in chords do not chase properly

This article has been archived and is no longer updated by Apple.

When you start playback at a point that's in the middle of a held chord, Logic will only chase some of the notes. At the point where the chord should end, notes that Logic didn't play back originally may sound very briefly.

This issue occurs when the notes in a held chord are staggered, and you start playback after the first note (or notes) occur, but before the later note (or notes) begin. For example, if you start playback at the point depicted below, the notes will not chase properly:

However, if you move the playhead so that playback starts after the later notes in the chord begin (as shown below), then the notes in the entire chord will be chased as expected.

This document will be updated as more information becomes available.

Mac OS X 10.4: Adding a PC card modem fax device

This article has been archived and is no longer updated by Apple.

Faxing over a PC card modem is possible in Mac OS X 10.4 Tiger, but not all PC card modems support faxing. Apple does not provide technical support for determining if your PC card modem can fax, or for configuring it. However, this article provides general steps on setting up a PC card to fax, which may help.

1. Connect the PC card modem to your computer if it isn't already.
2. Open Printer Setup Utility (it's in /Applications/Utilities).
3. Click the Add button to open the Printer Browser window.
4. Option-click the More Printers button.
5. In the sheet that appears, choose **Advanced** from the top pop-up menu.
6. From the **Device** pop-up menu, choose **Fax Printer (fax)**.
7. Type `card modem` in the Device Name field.
8. Type `fax://dev/cu.pccard-modem0` in the Device URI field.
9. From the **Printer Model** pop-up menu, choose **Other**.
10. When the "Choose a File" dialog appears, press Shift-Command-G to reveal the "Go to the folder" dialog. In this dialog, type:

    ```
    /System/Library/Frameworks/ApplicationServices.framework/Frameworks/PrintCore.framework/Resources/
    ```

11. Click Go. You will now see the files and folders located inside the Resources folder. Scroll down until you see folders with language names.
12. Select the appropriate folder for the language you are using. For example, Japanese users should select "Japanese.lproj."
13. Select "Fax.ppd" and click Choose.
14. Click Add.

Once you add a PC card modem fax device in Mac OS X 10.4, you should be able to send faxes using the PC card modem, if the card supports faxing.

iSync 2: Palm Conduit installer states "HotSync is not installed correctly"

This article has been archived and is no longer updated by Apple.

In iSync 2.0 (included with Mac OS X 10.4 Tiger), you can install Palm Conduit from within iSync to sync your Palm OS device with your computer.

If you cannot install the Palm conduit because the Conduit Setup Assistant tells you that your Palm HotSync software is not installed correctly, make sure that you've downloaded and installed the latest version of Palm Desktop from Palm's support website.

Note: Some releases of Palm Desktop version 4.2.1b may cause this issue to occur, even if it's installed properly. Download and install the latest version of Palm Desktop from Palm's website to correct this issue.

Language Kit Updater from Mac OS 8 (LKU8): Known Issues

This document discusses issues that may occur with the Apple Language Kits, running with Mac OS 8 and the Language Kit Updater for Mac OS 8.
This article has been archived and is no longer updated by Apple.

- There is a conflict between Language Kit Additions files created for LaserWriter 8.4.x and the LaserWriter 8.5.x driver. A crash will occur after selecting Print from any application if the printer driver selected in the Chooser is LaserWriter 8.5. In order to avoid this problem remove LaserWriter-related files from the Language Kit Additions folder inside the Extensions Folder which include the version 8.4 in their names. For example, LaserWriter 8.4.3 Z and PrintLib 8.4.3 Z should be removed.

  Apple is also planning to make available Language Kit Addition files for LaserWriter 8.5 and PrintLib 8.5, which when installed will prevent this problem.

- Users of the Japanese Language Kit 1.2 who are using the JIS-Keyboard (on computers sold in Japan) will not have complete JIS-Keyboard support while using the U.S. Keyboard. A few unique keys strokes do not correctly produce in Roman mode their equivalents in Japanese mode. Most keys strokes do, however, work properly.

- A problem in the Language Kit Extension (LKE) causes classic control panels (type: cdev) like PC Exchange and ColorSync to experience potentially long timeouts when requesting the Open file dialog box. This can also occur with the Change setup dialog from the Printing menu for desktop printers. You may experience a long wait that appears to be a freeze, i.e. the wait cursor can moved around the screen but nothing else can be changed. By waiting a minute or two, depending on the speed of your computer, the Open File dialog box will appear and you will not need to restart your machine. This problem only occurs when Mac OS 8 and the Language Kit Updater for Mac OS 8 are installed. To date, Apple tech support has received only a few reports worldwide of customers encountering this problem.

- The Language Kit Updater Read Me says that it updates Hebrew and Arabic Language Kits version 1.0.1. It also updates version 1.0.

Note: A new version of LKU8, with these problems fixed, will be posted in Apple SW Updates, when it becomes available.

Logic Pro/Express: How to send audio to Soundtrack Pro

This article has been archived and is no longer updated by Apple.

Soundtrack Pro can be a very useful addition to your Logic Pro or Logic Express workflow. While Logic doesn't have a dedicated feature that sends audio directly to Soundtrack Pro, you can edit audio from Logic projects in Soundtrack Pro by way of a Logic key command that opens an external sample editor, which you can set to open Soundtrack Pro. Here's how to do this.

Assign the key command first

By default, Logic doesn't have a key assigned to this command, so the first step is to assign one:

1. From the **Logic Pro** or **Logic Express** menu, choose **Preferences > Key Commands**.
2. In the Key Commands window, type `external` in the search field. The search engine returns the "Start external Sample Editor" command in the window. Select this command.
3. Click the "Learn by Key Label" button on the right side of the window to enable key assignment.
4. Press a key or key combination that you want to use to invoke this command.
5. Click the "Learn by Key Label" button again to disable it.
6. Close the Key Commands window.

You're now ready to start editing audio from a Logic song in Soundtrack Pro. Keep in mind that any editing you do in Soundtrack Pro is applied destructively to the audio files. Because of this, it's a good idea to make a backup of anything you plan to edit in Soundtrack Pro first before sending it to Soundtrack.

Edit Logic files in Soundtrack Pro

To edit audio from Logic in Soundtrack Pro, follow these steps:

1. In Logic, highlight the region you wish to edit in the Arrange window, then select **Arrange > Audio > Convert Regions to New Audio Files**.

2. A save dialog appears; enter a name for your file and select a save location if you wish.
3. With your newly created region highlighted in the Arrange window, press the key (or key combination) that you assigned for the "Start external Sample Editor" command.
4. The first time you use the key command, you'll be asked to select an application to use as the external editor:

Select Soundtrack Pro and click Open.

5. Soundtrack Pro opens and displays your selected Logic region in the Audio Wave Editor. As Soundtrack opens, Logic displays a dialog that says that the available number of MIDI ports has changed.

This happens because Soundtrack provides an internal MIDI port. Click OK to dismiss the message.

You may now perform any edits you like within Soundtrack Pro. The best way to do this is using Soundtrack Pro's Process effects. These are available from the Process menu in Soundtrack Pro. It is also possible to use realtime effects in Soundtrack Pro, by inserting them from the Effects tab; but if you do this, you must use **Process > Bounce Realtime to Action** to write the effects to the file.

Keep in mind that this is not an Audio File Project (.stap) in Soundtrack Pro, but a direct edit of the source file (Logic does not support the Audio File Project format). It's a good idea to avoid any edits that affect the length of the file, or change the number of channels (stereo-to-mono or mono-to-stereo conversions). Once you have performed your edits, save the file in Soundtrack Pro, and the results will immediately be audible when you switch back to Logic.

As long as you keep the file open in Soundtrack Pro, you may use its undo functionality to revert back to any stage in the current session's edit process. If you perform an undo, you must save the file again in Soundtrack Pro for the change to take effect in Logic. Once you close the file in Soundtrack Pro, or quit Soundtrack Pro, the edits cannot be undone.

After installing Mac OS X 10.4, the computer may seem slow and the fans may run more

This article has been archived and is no longer updated by Apple.

When you install Mac OS X 10.4 Tiger and then restart your computer, the OS will automatically begin indexing your hard drive for Spotlight searching. Depending on how many files and Mail messages are on your hard drive, this can take anywhere from several minutes to a few hours. But once the process is done, searching for stuff on your computer using the Spotlight icon in the menu bar, or the Find command in the Finder, will take very little time.

While your hard drive is being indexed, your computer fans may run more than usual, your computer may seem "slow," and you may notice additional processor activity in Activity Monitor.

It's a good idea to allow your computer to finish its initial indexing before doing any processor-intensive work on it. Otherwise, the indexing may take longer. You can check its progress by clicking the Spotlight icon in the menu bar.

If you interrupt the process by restarting your computer or shutting it down, the indexing will resume at the next restart.

Mac OS X 10.4: Blue screen or unable to log in if high ASCII characters are in password

This article has been archived and is no longer updated by Apple.

If you upgrade to Mac OS X 10.4, 10.4.1, or 10.4.2 from an earlier version of Mac OS X, and continue to use an existing user account whose password contains high ASCII characters (those that can be typed using the Option key), Mac OS X 10.4 may start up to a blue screen if you have automatic login enabled. If automatic login isn't enabled (you get the login screen), you may be unable to log in if your password contains high ASCII characters.

Note: High ASCII characters are "extended ASCII" characters that you typically type using the Option key. They are listed in table II of this webpage, and include the following characters: å ß ∂ ƒ ∆ ... æ Ω ≈ ç √ ∫ ~ µ ≤ ≥ ÷ œ Σ + ¥ ø π Å ™ ® ©

To resolve the issue, update to Mac OS X 10.4.3 or later. **Note:** This issue can still occur when switching users via Fast User Switching and using a high ASCII character in a password, even if 10.4.3 or later is installed.

Additional information

This issue can also occur (in Mac OS X 10.4 through 10.4.2) if you change your password in Accounts preferences and use high ASCII characters.

Tip: If you're setting up a new account in Mac OS X 10.4, such as when you get a new Mac, use Setup Assistant to set a password that does not contain any high ASCII characters. Otherwise, the Finder and desktop won't appear when you finish the Setup Assistant; you'll see only a blue screen.

Don‘t use an Apple Internal Modem with a PBX or digital phone line

This article has been archived and is no longer updated by Apple.

Always make sure that you're using an analog telephone line before you connect it to your Apple computer's internal modem.

If you plug a PBX or digital phone line into your computer's built-in modem, the line may cause damage to your modem. The Apple Internal Modem is designed for use with analog phone lines—the type that's commonly found in residential homes. PBX and digital phone lines are typically found in hotels and businesses, and require dialing "9" or another number in order to obtain an outside line. These phone lines carry a higher voltage than residential analog phone lines, which can cause damage to your computer's internal modem.

Logic Pro 7.1.1 Enhancements

This article has been archived and is no longer updated by Apple.

General

- Changing the sample rate in Logic when using the built-in audio of a Mac mini now works as expected.
- Trying to open a file that you do not have permission to access no longer causes Logic to quit unexpectedly.
- Importing protected (read-only) MIDI files now works as expected.
- Logic no longer displays the superfluous MIDI Port Change alerts when the number of MIDI ports changes.

Tiger Compatibility

- The import of AAC and MP3 files now works as expected.
- AAF export now works as expected.
- Restores function of key commands that make use of a modifier when using a Scandinavian keyboard layout.
- The TDM DSP Usage window is now also available in Tiger.

Compatibility

- Improves import of OMF2 files.
- No longer limits import of XML files to 25 minutes.

Editing

- Unlocking SMPTE-locked events in the Event Editor now always works for all selected events.
- When using Soundtrack Pro as external sample editor:
  - The waveform overviews shown in the Logic Arrange window now reflect all changes made in Soundtrack Pro.
  - Opening and editing SDII files in Soundtrack Pro now works as expected.
- Pressing Shift-Option-Control and rubber banding an automation track creates two automation nodes on each side of the rubber band area. Dragging the selected area up or down now creates two additional automation nodes – each with new values.
- Automating two state controls now works correctly: pressing the two state control now inserts two automation nodes. The first contains the old value, and is inserted just before the SPL. The second contains the new value and is inserted just after the SPL.
- Using the Logic Control to record enable a track, or to switch to a record enabled track that contains an inserted plug-in no longer causes Logic to quit unexpectedly.
- Use of the Mute key command on a note in the Score Editor (when the Content Link function is active for both the Score Editor and Arrange windows) no longer mutes the Region that contains the note.
- The Remove EQs and Remove Sends function now works as expected in the Audio Configuration window.
- Canceling the Convert To New Audio File dialog no longer creates a Region and replaces the selected Region in the Arrange window.
- If you create a Folder that contains a single Audio Region, you can effectively use the **File > Export > Region As Audio File** function, even if the Audio Region is not selected.
- Burning a CD from the Bounce dialog in Logic could create a CD of static noise, when one of the POW-r Dither options for PCM was activated – even if no PCM file was actually bounced (the PCM destination checkbox was not active).
- The Mute buttons of MIDI channel strips are now correctly displayed.
- Using the QuickTime 7 algorithms to time stretch mono audio files no longer causes Logic to quit unexpectedly.

Global Tracks

- Following the entry of a tempo change ramp in the global Tempo track, you can now edit tempo values in the Tempo List by double clicking on the BPM section.
- The Beat Mapping track now displays 3/4 time signatures correctly.

Apple Loops

- Apple Loops with odd time signatures are now played back at the correct speed.

Environment

- Protected Macro Objects can now be permanently protected.

Video

- QuickTime movies are now delay compensated, ensuring accurate synchronization with the audio engine.

- In some extremely rare cases, Logic did not automatically find the movie when loading a song. Screensets that included the Movie window could also be displayed incorrectly. The 7.1.1 Update addresses these issues.

DAE/TDM

- Bouncing now works as expected when the WAVE option is selected in the Recording File Type menu of the **Logic > Audio > General** preferences.
- The TDM DSP Usage window is now also available in Tiger.

General Plug-In Issues

- Logic now also searches the following folder for plug-in settings: /Library/Application Support/GarageBand/Instrument Library/Plug-In Settings folder. This resolves an issue that prevented the Bass Amp plug-in settings from being shown in the Settings menu.
- The Automation pull-down menu in the track list now shows all Ultrabeat and Sculpture parameters.
- Restores function of the EVB3 with the Native Instruments B4D draw bar controller.

Ultrabeat

- Swapping drum voices by dragging a voice to another voice's position no longer copies the sequences of the source.
- Loading an Ultrabeat setting while playing a drum voice in Multi Trigger mode no longer quits Ultrabeat unexpectedly.
- It is now possible to preview UBS files in the Sample Load window by pressing the Play button.
- You can now save the samples of a drum kit on an external drive without having to manually search for the samples after ejecting and reconnecting the drive.
- Saving a song as a project that contains an Ultrabeat kit that makes use of the same sample for different voices rather than saving the sample separately for each drum voice.
- Voices played in Multi Trigger mode are no longer cut off.

EXS24

- The EXS24 mkII can now handle more than 32,767 sampler instruments.

Match EQ

- Analyzing files shorter than 100 ms no longer creates empty spectrums.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Bookmarking audio and video files in iTunes 5 and later

This article has been archived and is no longer updated by Apple.

Starting with iTunes 5, you can enable a bookmarking feature that lets you bookmark any audio or video file in your iTunes library. This allows you to pick up from where you left off the last time you listened to or viewed the file. To enable an audio or video file's bookmarking function, do this:

1. Select a desired file in iTunes.
2. From the **File** menu, choose **Get Info**.
3. Click Options.
4. Select the "Remember playback position" checkbox.
5. Click OK.

If you have any iPod that has a Click Wheel that's been updated with iPod Updater 2005-06-26 or later, you can sync bookmarked files back and forth between your iPod and iTunes. For example, if you listen to a file on your iPod, stop playback, sync your iPod with iTunes, and then play that same file in iTunes, iTunes will start playback from the point you last heard on your iPod.

Not sure which iPod model you have? Find your iPod in the "Identifying different iPod models" article.

iPod: Setting up multiple clocks

This article has been archived and is no longer updated by Apple.

iPod Software 1.0 for iPod nano and Fifth Generation iPod allow iPod to keep multiple clocks for different time zones. This feature is also known as World Clock. You'll find the new clock features in the Extras menu (**Extras** > **Clock**).

About the Clock

Each clock displays an analog style clock face that shows the time, the name of a city in the chosen time zone, and the digital time. During daytime hours (from 6:00 AM to 5:59 PM), the clock features a white face with black hands; at nighttime (from 6 PM to 5:59 AM), the clock displays a black face with white hands.

You can add as many clocks to the Clock menu as you like. The clocks will appear in the Clock menu, in the order in which you add them—not alphabetically or by time zone.

Adding a Clock

1. Select **New Clock** from the **Clock** menu.

2. From the **Region** menu, select a region from the list.
3. You'll see a City menu that lists cities (in alphabetical order) that represent the different time zones in your selected region. Please note that some city lists can be quite long.
4. From the **City** menu, select the city that represents the clock you wish to create.
5. View your new clock in the Clock menu.

Settings

When you select a clock, you can change its settings, including:

- Alarm Clock
  Each clock can have it own alarm (see below for steps to set an alarm).
- Change City
  You can change a clock to represent a different city.
- Daylight Saving Time
  You can set the clock for daylight saving time when the city observes it.

Alarm Clock

If you want to make sure you don't oversleep, or need an audible reminder, you can set an alarm on any clock (each clock can have its own alarm). To set an alarm:

1. Select the desired clock in the **Clock** menu.
2. Select **Alarm Clock** from the city name's menu.
3. In the **Alarm Clock** menu, select **Alarm** to change its status from **Off** to **On**.
4. In the **Alarm Clock** menu, select **Time**, and on the next screen set the time that you want the alarm to sound.
5. In the **Alarm Clock** menu, select **Sound** and then select a sound or playlist. If you select **Beep**, iPod will play the alarm through its internal speaker. If you select a playlist, you'll need to connect speakers or headphones to your iPod to hear the alarm.
6. In the Clock menu, you'll see a bell icon next to any clock that has its alarm set.

Deleting a Clock

1. Select the unwanted clock in the **Clock** menu.
2. Select **Delete This Clock** from the city name's menu.

Sleep Timer

Like previous versions of iPod Software, you can set iPod to turn off automatically after playing music or a slideshow after a specified period of time. This feature is called the Sleep Timer. Even though the Sleep Timer menu option appears in each clock's menu, you can only have one Sleep Timer. Setting the timer in any one clock sets the global setting for the Sleep Timer.

Mac mini modem configurations

This article has been archived and is no longer updated by Apple.

Mac mini 1.25 GHz models (M9686xx/B) come standard with an internal 56K V.92 modem.

Mac mini 1.42 GHz models, both the Combo Drive model (M9687xx/B) and SuperDrive model (M9971xx/B), do not come with a modem as part of their default configuration.

An internal 56K V.92 modem is available as a Build To Order option for Mac mini 1.42 GHz models. Alternatively, if you purchase a 1.42 GHz Mac mini without a modem, you can have an Apple Authorized Service Provider or Apple Retail Store install an internal modem module for Mac mini (separate charges apply).

Apple Remote Desktop 2: Unable to add remote computer for Data Collection

This article has been archived and is no longer updated by Apple.

If you go to the Data Collection preference in Remote Desktop and drag a second Remote Desktop Administration computer into the "Remote computer address" field, the field may not display the address correctly. If you try manually typing the Remote computer's IP address in the field, the information disappears when you click Select.

This happens because the Data Collection feature requires two unique software serial numbers, as explained on page 86 of the Remote Desktop 2.2 Administration Guide:

> A remote computer that collects the data needs to be a licensed ARD administrator computer...

Check the current administration computer and the targeted remote computer to ensure that each has a serial number entered and that each is unique. To change a Remote Desktop serial number:

1. Open Remote Desktop Preferences and click the General tab.
2. Click Change in the lower-right corner of the window.
3. Enter your other licensed Remote Desktop serial number.

Tip: Additionally, a remote data collector must have port 3283 open for both TCP and UDP. TCP port 5900 must be open to do a Control or Observe of the computer, but otherwise doesn’t need to be open. UDP port 5900 would need to be open, if for some reason, you want to do a Share Screen to the computer.

Mac OS X 10.4: Mail - "Unable to open" alert when checking mail from Exchange public folders

This article has been archived and is no longer updated by Apple.

When Mac OS X 10.4 Mail tries to sync public folders on an Exchange server, you may encounter an alert such as this (where `XXXX` is the name of the public folder):

```
Unable to open XXXX
IMAP command 'SELECT' failed
```

You may see several of these error messages. To resolve this issue, download and install Mac OS X 10.4.3 or later.

About the Java Security Update

This article has been archived and is no longer updated by Apple.

This document describes the security content of Java Security Update, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How To Use The Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Java Security Update

- **Java**

  Available for: Java 1.3.1

  Impact: Java is updated to version 1.3.1_16

  Description: This release updates Java to version 1.3.1_16 to address a number of issues. Further information is available in the 1.3.1_16 section of Sun's release notes at http://java.sun.com/j2se/1.3/ReleaseNotes.html.

- **Java**

  Available for: Java 1.4.2

  Impact: Java is updated to version 1.4.2_09

  Description: This release updates Java to version 1.4.2_09 to address a number of issues. Further information is available in the 1.4.2_09 section of Sun's release notes at http://java.sun.com/j2se/1.4.2/ReleaseNotes.html. Credit to Sun and Marc Schoenefeld for notifying us about these issues.

- **Java**

  CVE-ID: CAN-2005-2527

  Available for: Java 1.4.2

  Impact: A file race condition can lead to file corruption or the creation of arbitrary files.

  Description: This is specific to the implementation of Java on Mac OS X. Under certain conditions, Java may insecurely handle a temporary directory. Subsequent file operations inside that directory could be exposed to file race conditions. This update addresses the issue by adding validation when operating in the temporary directory.

- **Java**

  CVE-ID: CAN-2005-2530

  Available for: Java 1.3.1

  Impact: An untrusted applet could gain elevated privileges.

  Description: This is specific to the implementation of Java on Mac OS X. A vulnerability in Apple's implementation of Java allows an untrusted applet to elevate privileges when using Mac OS X specific extensions. This update addresses the issue by implementing additional security checks. This issue does not affect Java on Mac OS X v10.4 or later.

- **Java**

  CVE-ID: CAN-2005-2738

  Available for: Java 1.4.2

  Impact: Network traffic intended for a particular Java ServerSocket could be intercepted by another one.

Description: This is specific to the implementation of Java on Mac OS X. It is possible for the same port to be opened as a Java ServerSocket multiple times without reporting an error. This can allow a Java program to intercept data intended for the ServerSocket of a different Java program. This update causes an exception to be thrown if a port is already in use. This issue does not affect Java on Mac OS X v10.4 or later. Credit to Jeremy Pfeifer of the University of Saskatchewan for reporting this issue.

About the security content of Java 1.3.1 and 1.4.2 Release 2

This article has been archived and is no longer updated by Apple.

This document describes the security content of Java version 1.3.1_16, and Java 1.4.2 Release 2, which can be downloaded and installed using Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How To Use The Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Java 1.3.1 and 1.4.2 Release 2

- **Java**

  Available for: Java 1.4.2

  Impact: Java is updated to version 1.4.2_09

  Description: This release updates Java to version 1.4.2_09 to address a number of issues. Further information is available in the 1.4.2_09 section of Sun's release notes at http://java.sun.com/j2se/1.4.2/ReleaseNotes.html. Credit to Sun and Marc Schoenefeld for notifying us about these issues.

- **Java**

  Available for: Java 1.3.1

  Impact: Java is updated to version 1.3.1_16

  Description: This release updates Java to version 1.3.1_16 to address a number of issues. Further information is available in the 1.3.1_16 section of Sun's release notes at http://java.sun.com/j2se/1.3/ReleaseNotes.html.

- **Java**

  CVE-ID: CAN-2005-2527

  Available for: Java 1.4.2

  Impact: A file race condition can lead to file corruption or the creation of arbitrary files.

  Description: This is specific to the implementation of Java on Mac OS X. Under certain conditions, Java may insecurely handle a temporary directory. Subsequent file operations inside that directory could be exposed to file race conditions. This update addresses the issue by adding validation when operating in the temporary directory.

- **Java**

  CVE-ID: CAN-2005-2528

  Available for: Java 1.3.1, Java 1.4.2

  Impact: Insecure temporary file handling can lead to file corruption or the creation of arbitrary files.

  Description: This is specific to the implementation of Java on Mac OS X. The privileged helper used to update Java shared archives insecurely creates temporary files, which can lead to a file race condition. This update addresses the issue by avoiding file operations in user-accessible locations. This issue does not affect systems prior to Mac OS X v10.4. Credit to kf_lists[at]digitalmunition[dot]com for reporting this issue.

- **Java**

  CVE-ID: CAN-2005-2529

  Available for: Java 1.4.2

  Impact: Malicious system users can gain elevated privileges.

TA23502_About_the_security_content_of_Java_and_Release_.pdf

Description: This is specific to the implementation of Java on Mac OS X. The utility used to update Java shared archives is susceptible to a privilege escalation vulnerability from local system users. This update addresses the issue by performing additional clean-up before launching the utility on behalf of unprivileged users. This issue does not affect systems prior to Mac OS X v10.4. Credit to Dino Dai Zovi for reporting this issue.

iPod does not work when plugged into a keyboard

This article has been archived and is no longer updated by Apple.

To charge and sync iPod nano or Fifth Generation iPod, make sure that you connect the USB cable to one of the built-in, high-powered USB ports on your computer (USB 2.0 recommended) or to a powered USB hub that's connected to the computer (for example, many Apple displays contain powered USB hubs). iPod nano and Fifth Generation iPod will not work when it's plugged into a USB port on your keyboard.

Mac OS X 10.4: About improved disc burning and Burn Folders

This article has been archived and is no longer updated by Apple.

Mac OS X 10.4 Tiger makes it even easier to burn to a writable CD or DVD but there are some things you should be aware of if you're used to burning discs in earlier versions of Mac OS X.

Tiger uses aliases for improved burning

Before Mac OS X 10.4, data was copied twice before burning—Tiger copies the data only once, accelerating the burning process. Tiger accomplishes this by creating *aliases* to the data to be burned.

For example, if you drag a folder to a blank disc icon to burn its contents, Tiger temporarily puts an alias on the disc. When you later burn the disc, the actual data that the alias points to is burned to the disc. This means that when you drag stuff to an blank disc's icon (or Burn Folder, see below), a temporary alias is created on the disc or in the folder.

Important: Aliases on discs that haven't been burned yet point to your actual data; data is not copied to the disc until you actually burn the disc. This means if you double-click the alias and modify the files or content, you are modifying the original data on your hard disk—not just the data on the unburned disc.

When Tiger burns the disc, it burns the original data to the disc, not the temporary aliases.

Burn Folders make disc burning easier

Mac OS X 10.4 also introduces Burn Folders in the Finder. This feature makes it easy to get your stuff ready for burning without actually having to have a disc in the computer (until you're ready to burn it, of course). You'll see a black "burn banner" inside the folder as a reminder, along with a Burn button. When you click the Burn button, you are prompted to insert a writable disc and told how much free space it must have to burn the contents of the folder.

Removing stuff from a burnable disc or Burn Folder before burning

You can delete aliases from a Burn Folder or unburned disc without affecting your original data to which the aliases point. These aliases are at the "highest" (or root) level of the Burn Folder or unburned disc. As mentioned, if you actually double-click any of these aliases, you'll be able to modify the files on your hard drive. In other words, when a Burn Banner is present, you can delete the data aliases with no consequence to the actual data on the hard disk.

Important: Do not double-click a burn alias and then delete the aliased content. This does not remove anything from the disc or Burn Folder, but does remove content from your computer!

What happens if an alias is manually copied to the disc or Burn Folder?

When the burn starts, Mac OS X 10.4 will attempt to burn the data that any alias points to, even if it's not as the root level of the unburned disc or Burn Folder. If your alias points to missing data, this alert appears:

> "The item '*name of item*' cannot be burned because the original item cannot be found. Skip this item and continue burning?"

To avoid this, don't create aliases on unburned discs or Burn folders. Instead, drag the original content to the disc or folder so that Mac OS X will create the alias for you.

How large is the burn folder?

To see the number of items and data size that will be burned, open the burn folder and look at the bottom of the window; or, select the folder and choose **Get Info** from the **File** menu. Also, you can click the refresh button in the bottom right corner of the burn folder window if you add or remove items from the folder.

Some Xsan configurations will cause an error when using Distributed Processing for Compressor

This article has been archived and is no longer updated by Apple.

Symptom or Issue

If you submit a Compressor batch to a QMaster cluster, the batch may not get processed and you'll get the following error instead:

> NewMovieFromFile failed -2048.

This issue is caused by some Xsan volume configurations and affects the following products:

- Compressor 2.x
- QMaster 2.x
- Xsan 1.x
- DVD Studio Pro 4
- Final Cut Studio

Solution

Update to Xsan 1.4 to resolve this.

QuickTime for Windows: Installation won‘t work if another user is using QuickTime Player

This article has been archived and is no longer updated by Apple.

Before you install QuickTime for Windows, make sure that no other user on your computer has QuickTime Player open. If another user account has QuickTime Player open while you attempt to install QuickTime, the installation won't work and QuickTime Player will not be installed properly.

To prevent this, do one of the following before installing QuickTime:

- Logout all other users.
- Quit QuickTime Player in all logged in user accounts.
- Restart the computer.

This document will be updated as more information becomes available.

QuickTime 7 on Windows: "Loading" message appears instead of the Content Guide

This article has been archived and is no longer updated by Apple.

When using QuickTime 7 on a computer with Windows XP, you might see a "Loading" message instead of the Content Guide if the "Automatically play movie when opened" option is selected in QuickTime preferences.

To prevent this from happening:

1. On the **Edit** menu, point to **Preferences**, then click **Player Preferences**.
2. Deselect the "Automatically play movie when opened" checkbox. The Content Guide should now open normally.

Update to QuickTime 7.1 or later to resolve this.

QuickTime for Windows: Uninstall QuickTime 3 or 4 before installing QuickTime 7

This article has been archived and is no longer updated by Apple.

If you are trying to install QuickTime 7 and run into difficulty, see if your computer has QuickTime version 3 or 4 installed on it. If it does, uninstall QuickTime 3 or 4 completely before attempting to install QuickTime 7 again. Once the old version is gone, you should be able to install QuickTime 7 normally.

This document will be updated as more information becomes available.

QuickTime Pro: Fast Start may not work if movie is modified after being saved

This article has been archived and is no longer updated by Apple.

The Fast Start feature in QuickTime Pro allows you to begin playing a movie while it's still being downloaded. Instead of having to wait for the entire movie to download, QuickTime Player can start playing the already downloaded part, while the rest of the movie continues to download in the background.

For Fast Start to work, you need to select the Fast Start option in the Save dialog when you create the movie.

Please note that if you modify the movie after saving it with the Fast Start option, the Fast Start feature may not work correctly. For example, if you create a movie with Fast Start enabled and then add annotations and save the movie again, the Fast Start feature may not work.

To prevent this from occurring, be sure to save the movie again with the Fast Start checkbox selected before posting your movie for download.

iTunes 5 and QuickTime 7 for Windows: Installation won‘t work if Cygwin is running

This article has been archived and is no longer updated by Apple.

If you're running Cygwin on your Windows computer and try to install QuickTime 7 or iTunes 5 (which installs QuickTime), the installer may not work properly, which will prevent installation. (Cygwin is software that provides a Linux-type environment for Windows.)

Download and install QuickTime 7.0.4 or later or iTunes 6 or later to resolve this.

About Pro Applications Update 2005-02

This article has been archived and is no longer updated by Apple.

Pro Applications Update 2005-02 addresses several issues with underlying frameworks and shared components for Apple's professional applications, and is strongly recommended for all users of Final Cut Studio, Final Cut Pro 5, Motion 2, Soundtrack Pro, DVD Studio Pro 4, LiveType 2, Compressor 2, Apple Qmaster 2, and Final Cut Express HD 3.

Pro Applications Update 2005-02 updates the following components:

- **Helium.framework**
  - Helium 2.0.2 addresses underlying issues with PAL to NTSC transcoding.
  - Addresses the field inversion (image jitter) issue when using Compressor to transcode from HDV to Standard Def MPEG-2.

- **DesktopVideoOut.component**
  DesktopVideoOut 1.2.3 addresses issues with DCD Main.

Requirements for this update

- Mac OS X 10.3.9 or later
- QuickTime 7.0 or later

And at least one of the following:

- Final Cut Express HD 3.0 or 3.0.1
- Pro Applications Update 2005-01 (You'll find the ProAppsUpdate2005-01.pkg file in the Receipts folder if installed.)

Mac OS X Server: Problems creating Replicas in 10.4.2

This article has been archived and is no longer updated by Apple.

Under certain circumstances, a replica that you're trying to create may turn back to Stand Alone, or you see errors in the /Library/Logs/slapconfig.log on the replica, such as:

```
Authentication failed error is -14098
```

or

```
GetReplicaSetup = -14103
```

This can happen after you set a computer from replica, to Stand Alone, then back to replica. To change the replicas back to Stand Alone and clean up the databases, follow the steps below. All commands run from the Terminal must be as root.

1. Make sure the Kerberos server is running on the master. Check the General tab in Server Admin, Open Directory. If it's not, you will need to fix this first.
2. Change the role of the replica back to Stand Alone.
3. For the old replica, check Workgroup Manager and make sure there are no Local users with Open Directory password types (the admin may have been set to use such a password). If you find any with Open Directory passwords, change them to use Shadow passwords.
4. Make sure you have a directory admin that does not have the same short name or user ID (UID) as the local admin. This normally only happens if the server has been upgraded. If you don't, create a new admin in the LDAP domain to use as the directory admin when creating replicas.
5. Run the following commands as root on the replica, ignoring the message, "No such process - nothing found to load," after entering the NeST command:

   ```
   NeST -stoppasswordserver
    mv /var/db/authserver  /var/db/authserver.old
    mv /var/db/krb5kdc /var/db/krb5kdc.old
    mv /etc/krb5.keytab /etc/krb5.keytab.old
    mv /Library/Preferences/edu.mit.Kerberos /Library/Preferences/edu.mit.Kerberos.old
   ```

6. On the master, open Preferences in Workgroup Manager.
7. Select "Show all records Tab and Inspector."
8. Click the Accounts icon, then the target tab.

9. From the pop-up menu, choose **Config**.
10. Remove any passwordserver_XXXXX records (where "XXXXX" is any number), but keep the copy that's named "passwordserver" (without a number appended).
11. In the passwordserver record, remove any references to the replica in the PasswordServerList. To do this:
    a. Select PasswordServerList.
    b. Click Edit.
    c. Remove the text (see below for the text example).
    d. Click OK.
    e. Save.
12. Go to Config / ldapreplicas, then to LDAPReadReplicas.
13. If you see more than one replica, open each to see if it lists its IP address. If it does, select it and press Delete on your keyboard. Do **not** click the Delete icon, as this will delete the "ldapreplica" record. Click Save.
14. On the master, back up your var/db/authserver/authserverreplicas file:

    ```
    cp /var/db/authserver/authserverreplicas /var/db/authserver/authserverreplicas.backup
    ```

15. Stop the PasswordService:

    ```
    NeST -stoppasswordserver
    ```

16. Remove the replica (or replicas) from the /var/db/authserver/authserverreplicas file. In the following example text, the portion shown in red can be safely removed. Note that you delete the first red line, <key>Replicas</key>, only if you are going to delete all replicas from the list. If you leave any replica in the list, you must also leave this line. In most cases, you will only delete one of the replicas, so you would leave the line. However, in the example below, the line would be deleted because both replicas are being removed:

    ```
     <?xml version="1.0" encoding="UTF-8"?>
    <!DOCTYPE plist PUBLIC "-//Apple Computer//DTD PLIST 1.0//EN" "http://www.apple.com/DTDs/PropertyList-1.0.dtd">

  <key>ReplicaName</key>
  <string>Replica2</string>
 </dict>
</array>
<key>Status</key>
<string>AllowReplication</string>
</dict>
</plist>
```

17. On the master, restart the PasswordService:

    ```
    NeST -startpasswordserver
    ```

18. Make sure that the /var/db/authserver/authserverreplicas file is correct and not empty:

    ```
    more /var/db/authserver/authserverreplicas
    ```

    If there is an issue, use the /var/db/authserver/authserverreplicas.backup file and repeat steps 16 to 18. Recheck.

Error 1920 or 1921 when installing iTunes 5 for Windows

This article has been archived and is no longer updated by Apple.

When you install iTunes 5 for Windows, one of the following errors may appear near the end of the installation process that says:

> Error 1920. Service Bonjour Service (Bonjour Service) failed to start. Verify that you have sufficient privileges to start system services.
>
> Error 1921. Service bonjour service could not be stopped. Verify that you have sufficient privileges to stop system services.

This error can be caused by two things:

- The Windows Management Instrumentation service isn't running on your computer.
- Norton Internet Security 2005 is running on the computer.

To resolve this issue, update to iTunes 5.0.1 or later.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Final Cut Pro 5: Uncompressed PAL setups have incorrect field dominance

This article has been archived and is no longer updated by Apple.

If you're working in PAL using either the Uncompressed 8-bit or Uncompressed 10-bit Easy Setup in Final Cut Pro 5, please be aware of an error in these settings: The field dominance is set to Lower (Even), but it should be set to Upper (Odd).

Since most capture cards use their own Easy Setups, you probably won't encounter any issues if you're capturing new material. But if you're editing existing material, make sure that you adjust the sequence settings by setting the field dominance to Upper (Odd) in Final Cut Pro.

For information on changing Sequence Settings, please see the Final Cut Pro User's Manual (available from the **Help** menu).

This document will be updated as more information becomes available.

Published Date: Feb 20, 2012

Mac OS X 10.4 or later: Remotely-based X11 applications quit unexpectedly or behave erratically

This article has been archived and is no longer updated by Apple.

If you use xterm in X11 to connect to a remote server over an ssh session and then execute an X11 application on that remote host, the application could exhibit unexpected behavior (application menus may not work), or quit unexpectedly with a variety of error messages.

For example, if you start a remote ssh session by entering `ssh -X remote.host.com` and then launch an application, you might encounter messages like the ones listed below by application name.

eclipse-SDK-3.1M5a-linux-gtk install

```
The program '' received an X Window System error.
This probably reflects a bug in the program.
The error was 'BadWindow (invalid Window parameter)'.
  (Details: serial 5931 error_code 3 request_code 38 minor_code 0)
  (Note to programmers: normally, X errors are reported asynchronously;
   that is, you will receive the error a while after causing it.
   To debug your program, run it with the --sync command line
   option to change this behavior. You can then get a meaningful
   backtrace from your debugger if you break on the gdk_x_error() function.)
```

gimp

```
Gdk-ERROR **: BadWindow (invalid Window parameter)
  serial 26717 error_code 3 request_code 38 minor_code 0
Gdk-ERROR **: BadAccess (attempt to access private resource denied)
  serial 26718 error_code 10 request_code 102 minor_code 0
```

glade-2

The program won't run or stops responding. The error message given is:

```
Gdk-ERROR **: The program 'glade-2' received an X Window System error.
This probably reflects a bug in the program.
The error was 'BadAtom (invalid Atom parameter)'.
  (Details: serial 1058 error_code 5 request_code 20 minor_code 0)
  (Note to programmers: normally, X errors are reported asynchronously;
   that is, you will receive the error a while after causing it.
   To debug your program, run it with the --sync command line
   option to change this behavior. You can then get a meaningful
   backtrace from your debugger if you break on the gdk_x_error() function.)
aborting...
```

However, no error message appears in the local Console application (console.log or system.log files).

Resolving the issue

Use the following command to initiate your remote ssh session in the X11.app xterm session:

```
ssh -Y remote.host.com
```

The -Y option "Enables trusted X11 forwarding," which is required to initiate these remote X11 sessions in Mac OS X 10.4 and later. For more information, please see the OpenSSH FAQ (http://www.openssh.com/faq.html#3.13).

Mac OS X 10.4.2: Issues after Archive and Install of 10.4 followed by reapplication of 10.4.2

This article has been archived and is no longer updated by Apple.

If you were using Mac OS X 10.4.2, then performed an Archive and Install of Mac OS X 10.4, then updated to Mac OS X 10.4.2 again via Software Update, some Apple applications may not be properly updated or work as expected.

For example, you might not see existing email messages in Mail after updating to Mac OS X 10.4.2.

Note: This issue only occurs in the scenario described above. It does not happen when reapplying 10.4.2 via the standalone Mac OS X 10.4.2 Combo update.

Solution

If you already updated to Mac OS X 10.4.2 via Software Update following an Archive and Install of 10.4, follow these steps:

1. Open the folder named Previous System if it's still on your Mac OS X volume.
2. Delete the Applications folder from the Previous System folder. Make sure you've collected any important files you want from it if you haven't already (normally, you should reinstall third-party applications later instead of saving them from this folder).
3. Download and install the Mac OS X 10.4.2 Combo update from Apple Downloads.

After updating, your Apple applications should be at the correct versions, and Mail should display your existing messages. Reinstall any third-party applications that were in the former Applications folder from their original source discs or images.

To avoid the issue after an Archive and Install installation of Mac OS X 10.4, but before 10.4.2, follow these steps:

1. Open the folder named Previous System.
2. Delete the Applications folder from the Previous System folder. Make sure you've collected any important files you want from it if you haven't already (normally, you should reinstall third-party applications later instead of saving them from this folder).
3. Download and install the Mac OS X 10.4.2 Combo update.

After updating, your Apple applications should be at the correct versions, and Mail should display your existing messages. Reinstall any third-party applications that were in the former Applications folder from their original source discs or images.

Additional information

Apple applications that could be affected include Address Book, Automator, Font Book, iChat, Safari, Mail, and Stickies. In Mac OS X 10.4.2, the versions of these applications should be:

- Address Book 4.0.2
- Automator 1.0.1
- Font Book 2.0.1
- iChat 3.0.1
- Mail 2.0.2
- Stickies 5.1
- Safari 2.0.1

Logic Pro/Express 7: Track doesn‘t appear highlighted when selected with a control surface

This article has been archived and is no longer updated by Apple.

When you select a Logic Pro 7 or Logic Express 7 track with a control surface, the corresponding track in the Arrange window may not appear to be selected. This can happen when you have more than one instance of a channel assigned to tracks in the Arrange window.

In the image above, the first two tracks are both assigned to Audio 1 in the mixer. Each has a different drum loop, though the first track is muted. Everything, as it appears above, will work as expected; if you select Audio 1 on a connected control surface, track 1 will appear highlighted in the Arrange window.

However, if you hide the muted track by clicking the global Hide button (the round "H"—it'll turn light blue), enable the track hide button on the first track, click the global Hide button again (it'll turn orange to indicate that there is a hidden track), and then press Audio 1 on your control surface, nothing will appear highlighted in the Arrange window.

This happens because the first instance of any track is highlighted when you select with a control surface, and that's a hidden track in this case.

Resolving the issue

If you are using a Logic Control or a Mackie Control, you can put the control surface into "Arrange View" by pressing the Shift and Global buttons on the control surface. In this mode, each Arrange track will be assigned to channel strips on your control surface, even if they are assigned to the same Logic mixer channel. If you prefer not to use multiple channel strips on your control surface for tracks assigned to the same mixer channel, then use these steps:

1. Click the global Hide button to reveal the hidden track (or tracks).
2. In the Arrange window, drag an unhidden instance of the track to a higher position than the hidden instance.
3. Click the global Hide button again to hide the track.

Now you can select the unhidden instance with your control surface.

AirPort for Windows (Japanese): Network name doesn‘t appear correctly in wireless connection window

This article has been archived and is no longer updated by Apple.

If an AirPort network name (SSID) contains non-ASCII characters (Japanese, for example), it may not appear correctly in the wireless connection window to Windows 2000 and Windows XP users who are trying to join the network.

Windows XP and Windows 2000 users can still connect to an affected AirPort wireless network, despite the incorrect name. To achieve a predictable name, use AirPort Admin Utility to rename the network using Roman characters.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Xsan: Working with 2TB and larger LUNs

This article has been archived and is no longer updated by Apple.

Xsan 1.3

Xsan 1.3 supports LUNs larger than 2 TB. Xsan 1.3 is a downloadable update recommended for all Xsan users.

Xsan 1.0 to 1.2

Xsan 1.2 and earlier supports LUN sizes of 2 TB (terabytes) or smaller. However, if you're using an Xserve RAID that provides LUNs larger than 2 TB (such as Xserve RAID installations that use the newer 500 GB hard drives), you can use RAID Admin to create RAID sets that are smaller than 2 TB, or use the slicing feature in RAID Admin (under the Advanced tab) to divide existing RAID sets into smaller LUNs. Please keep this in mind when planning your Xsan network setup.

For optimal performance, use the following procedure as your guideline.

Step 1: Minimize the number of slices

In RAID Admin, slice the available storage into as few slices as possible, making sure to keep each below 2 TB. For example, create 2 LUNs from one that is initially 3.5 TB.

In the diagram below, the 3.5 TB LUN that comprises the drives on the left side of the Xserve RAID (controlled by the upper controller) has been sliced into two LUNs (LUN0, LUN1), while the 3.5 TB LUN that comprises the drives on the right side of the Xserve RAID (controlled by the lower controller) has also been sliced into two LUNs (LUN0, LUN1).

After you finish slicing, restart all Xsan nodes so that they recognize the slices.

Step 2: Correlate LUNs to RAID slices

Next, determine which LUNs in Xsan Admin correspond to which RAID slices. Open RAID Admin, click the Fibre Channel tab, and note the World Wide Name (WWN) for both the upper and lower controllers.

Choose **Setup > LUNs**. Each new slice should appear as "Unlabeled." The Information panel for each LUN includes a LUN number and a WWN that will correspond with the WWN of one of your Xserve RAID controllers.

In our example, the WWN `50:00:39:30:00:00:9A:44:0` corresponds to the Xserve RAID's upper controller, WWN `60:00:39:30:00:00:9A:44:0`, and this LUN has the LUN ID `0`.

Tip: It's a good idea to label each LUN according to its physical position in the rack and within the RAID. For example, we labeled a LUN with the LUN ID `0` that's associated with the upper controller of the second Xserve RAID in our rack as `RAID2LeftLUN0`.

Step 3: Create the Xsan volume

In Xsan Admin, choose **Settings > Storage**. When creating an Xsan volume that uses slices for LUNs, be sure to choose **Fill** from the **Allocation Strategy** pop-up menu for your storage pools.

Step 4: Add the slices to a storage pool

As you add LUNS (in this case, slices) to storage pools, limit yourself to one slice per RAID controller per storage pool. For example, if you create a new volume, MyVol, and three storage pools—MetaPool, FastPool, and FasterPool—you could add them like this:

Note that both FasterPool and FastPool contain one slice from each side of your Xserve RAID. Since we set the Allocation Strategy for FasterPool to Fill, it will fill up before FastPool is written. Slices with lower LUN IDs will be slightly faster than those with higher LUN IDs. In our example, the LUN ID 0 slices belong to FasterPool, while the LUN ID 1 slices belong to FastPool.

If you add LUNs, which are slices of a pre-existing Xsan volume, you should create new storage pools to handle the new storage, and change the volume's Allocation Strategy to Fill.

Mac OS X 10.4: Saving Fax preferences

This article has been archived and is no longer updated by Apple.

You can change any settings that you wish in the Faxing pane of Print & Fax preferences; however, your changes take effect only if the lock icon in the lower left corner of the window is first "unlocked."

Otherwise, any changes made will revert to previous settings.

Follow these steps to save Faxing preferences:

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **Print & Fax**.
3. Click "Faxing".
4. Click the closed lock icon in the bottom left corner of the window.
5. Enter the name and password of an administrator to authenticate.
6. Make whatever Faxing preferences changes you wish (changes take effect immediately), then close the window.

This document will be updated as more information becomes available.

Published Date: Oct 7, 2016

Mac OS X 10.2 or later: Unable to print to a shared HP printer

This article has been archived and is no longer updated by Apple.

If you're using Mac OS X 10.2 or later to print to an HP raster (inkjet) printer that's being shared by a Mac OS X-based computer, the same version of the printer driver should be installed on both computers. Otherwise, the print job might not print even though the computer sharing the printer can print without issue. The application being used to print may unexpectedly quit when attempting to print to the shared printer.

To make sure that both computers are using the same driver, download and install the latest driver available from the HP Software & Driver Downloads website.

Note: You can print without having an HP printer driver installed on a computer connecting to a shared printer, but you will not have access to some printer-specific settings.

AirPort: How to configure Mac OS X 10.4 "Tiger" clients for LEAP authentication

This article has been archived and is no longer updated by Apple.

If you select LEAP authentication on a Mac OS X 10.4.2 or later computer on which the AirPort 4.2 or later update has been installed, your authentication settings may be lost after restart, sleep, or location change. As a workaround, you should use the steps shown here, which will have the effect of configuring LEAP, even though you will choose WEP from the menu.

1. Go to the Network pane of the System Preferences, show AirPort, and click the AirPort tab.
2. Be sure the "By default, join" menu is set to "Preferred networks."

   Note: If you don't have "Preferred networks" as a choice, this means that your 10.4 system was upgraded from 10.3, and that you're still using a Location imported from 10.3 (Panther). In this situation, you experience Panther behavior instead of new Tiger features. You will need to create a new location to utilize Tiger features and complete these steps.

3. Click the "+" button.
4. Enter the desired network name in the window that appears.
5. From the Wireless Security pop-up menu, choose WEP Password.
6. Replacing `username` and `password` with actual name and password, enter them exactly as show here, including both brackets and slash:

   ```
   <username/password>
   ```

   Note: Though there will not be any visible indication, this entry format sets the client to use LEAP rather than WEP.

7. Click OK. **Note:** The network entry will appear in the table as "WEP," but LEAP will be used.
8. Click Apply Now.

Final Cut Pro 5: Tips for using the Sony PDW-1500

This article has been archived and is no longer updated by Apple.

As mentioned in the Final Cut Pro List of Qualified Devices, Final Cut Pro 5 is compatible with Sony's PDW-1500 XDCAM Deck. Here are some tips for using this device with Final Cut Pro.

Sony's PDW-1500 NTSC unit is qualified for use with Apple Final Cut Pro using the FireWire interface in AV/C mode. This permits the DVCAM streams to be captured and recorded to disc similar to using a DVCAM tape deck. Assemble edit and insert edit functions are not supported by the PDW-1500, so all newly-recorded material is appended to the end of the disc in DVCAM format.

Currently, DVCAM and MPEG IMX MXF files from Sony's XDCAM products can be imported into Final Cut Pro 5 using Telestream's Flip4Mac MXF import component.

If you insert a disc with MPEG IMX into the PDW-1500, you can import a DVCAM version of the material when you perform a batch import. When you want to print the DVCAM version of the sequence back to a disc using the Print To Tape function, the deck needs to be in DVCAM record mode (and you have to put the final sequence on a new disc). You cannot mix formats on the same disc.

iTunes for Windows may unexpectedly quit when syncing folders of pictures with iPod

This article has been archived and is no longer updated by Apple.

iTunes may unexpectedly quit when you try to synchronize folders containing pictures to your iPod. This can happen if you create two or more subfolders in a folder such as "My Pictures," and the names of subfolders contain fullwidth digits (0-9) of a 2-byte (Unicode) character set.

Examples of folder names that include these fullwidth digits:

- "１" (Unicode character FF11)
- "２" (Unicode character FF12)
- "自然１"
- "自然２"

This can happen with iTunes for Windows and any iPod with a color display.

Update to iTunes 6 or later or use the figures from a single-byte (Roman) character set to prevent this from occurring.

Final Cut Pro, Final Cut Express: Tips for using devices that handle both HDV and DV

This article has been archived and is no longer updated by Apple.

Many HDV cameras and decks are able to play and record DV as well as the higher-resolution HDV format. Additionally, many of these HDV devices will attempt to automatically change their settings to match the format of the tape that it's playing. Here are some tips for using these types of devices with Final Cut Pro / Final Cut Express.

Tip: Make explicit settings on your HDV device.

Instead of using an "Auto" setting, make your own settings on your HDV device to keep the communication going between it and Final Cut Pro / Final Cut Express. This also helps Final Cut Pro / Final Cut Express keep things running smoothly with HDV devices that handle both DV-NTSC and DV-PAL.

For example, say you're using an HDV deck to capture footage from a tape that was recorded as DV-NTSC. Before capturing in Final Cut Pro / Final Cut Express, make sure that you set the deck to DV mode specifically—don't rely on Auto mode. With some devices, you may need to disconnect it from FireWire to change the mode.

For a common capture workflow, this sequence of steps can provide the best results:

1. Quit Final Cut Pro / Final Cut Express if it's open.
2. Insert your tape into your HDV deck or camcorder.
3. Use the device's menus to set it to match the format that's recorded on the tape.
4. Connect your HDV device to your computer with a FireWire cable.
5. Open Final Cut Pro / Final Cut Express.
6. Choose an Easy Setup for DV or HDV (whichever matches the format recorded on your tape).
7. Proceed to Log and Capture.

Tip: Quit Final Cut Pro / Final Cut Express before changing modes.

It's generally a good idea to quit Final Cut Pro / Final Cut Express before you change the mode on your device from DV to HDV, or from HDV to DV, and then re-open the application again.

Tip: Use an Easy Setup to play back non-default HDV format footage on your HDV device.

You can use Final Cut Pro / Final Cut Express to make your HDV device play back footage in its non-default HDV format. For example, maybe you have a 1080i60 HDV device and want to play back footage that was recorded as 1080i50. Or perhaps you have a 1808i50 HDV device and you want to play back footage that was recorded as 1080i60. To do this, follow these steps:

1. Connect your camera to your computer.
2. In Final Cut Pro / Final Cut Express, choose an HDV preset Easy Setup that matches the format of the tape's footage (you don't need to restart Final Cut Pro / Final Cut Express).
3. Your device's LCD display should automatically display a switch to 60 or 50, indicating the type of media that's being played.

Playing back non-default DV format footage on your HDV device

You can also use your HDV device to play back footage in its non-default DV format too. For example, maybe you have a 1080i60 HDV device and want to play back footage that was recorded as DV-PAL. Or maybe you have a 1080i50 HDV device and want to play back footage that was recorded as DV-NTSC. If so, follow these steps:

1. Make sure that your device is in DV/DVCAM mode.
2. Put your device into Play/Pause mode, then open the Log and Capture window in Final Cut Pro / Final Cut Express.
3. Make sure that your device's LCD (or other readout screen) displays the same format as your tape or Final Cut Pro / Final Cut Express will misinterpret what type of device you have.

Tip: Avoid recording both HDV and DV formats on the same tape.

Use separate tapes whenever you want to record in a different format. If you need to record over existing footage in a different format (for example, you have a tape with DV-PAL on it, but you want to record over it with HDV 1080i50), it's a good idea to black and code the tape, or completely record over the old footage with contiguous recording in the new format. If the tape contains even a second of, say, DV in the middle of an HDV tape (or vice versa), it could cause unexpected results later when you try to capture video from that tape.

For more information, see **HD and Broadcast Formats** and the **Final Cut Pro / Final Cut Express User Manual**, available under the Final

Cut Pro / Final Cut Express **Help** menu.

About Java 2 Platform Standard Edition (J2SE) 5.0 Release 3 for Mac OS X v 10.4.2 or later

This article has been archived and is no longer updated by Apple.

Java 2 Platform, Standard Edition (J2SE) 5.0 Release 3 allows applications and applets developed for the J2SE 5.0 platform to run on Mac OS X v 10.4.2 and later.

This update does not change the default version of Java on your Mac from Java 1.4.2 to J2SE 5.0, though Java applications that require J2SE 5.0 may specifically request it. You can change the preferred Java version for applications and applets by using the new Java Preferences utility. This utility is installed by the J2SE 5.0 update at `/Applications/Utilities/Java/J2SE 5.0/`.

Installing J2SE 5.0 Release 3

1. Get the J2SE 5.0 Update here.
2. Double-click the "J2SE50Release3.dmg" disk image file that you downloaded, and it will mount to appear as a disk in the Finder.
3. Open the mounted disk, then double-click the Installer icon.
4. Follow the onscreen instructions to complete the installation.

Software developers may visit the Java Reference Library for information on this release's features.

About Security Update 2005-008

This article has been archived and is no longer updated by Apple.

This document describes Security Update 2005-008, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How To Use The Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Security Update 2005-008

- **ImageIO**

  CVE-ID: CAN-2005-2747

  Available for: Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: Viewing a maliciously-crafted GIF image may result in arbitrary code execution.

  Description: By carefully crafting a corrupt GIF image, an attacker can trigger a buffer overflow in ImageIO which may result in arbitrary code execution. Several components of Mac OS X utilize ImageIO including WebCore and Safari. This update addresses the issue by performing additional validation of images.

- **Mail**

  CVE-ID: CAN-2005-2746

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: When using auto-reply rules, Mail.app may expose the contents of encrypted messages.

  Description: Mail.app includes the contents of messages when processing auto-reply rules. If a message being processed was encrypted, the automatically generated response will include the decrypted message contents. This could allow an attacker to intercept the message. This update addresses the issue by ensuring that unencrypted responses to encrypted messages are not generated. Credit to Norbert Rittel of Rittel Consulting for reporting this issue.

- **Mail**

  CVE-ID: CAN-2005-2745

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9

  Impact: Using Kerberos Version 5 for SMTP authentication Mail.app may disclose sensitive information.

  Description: When using SMTP authentication with Kerberos Version 5, Mail.app may append un-initialized memory to a message. This update addresses the issue by updating Mail.app. Credit to the MIT Kerberos team for reporting this issue. This issue was resolved in Mac OS X v10.4.2 by Security Update 2005-007.

- **malloc**

  CVE-ID: CAN-2005-2748

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: Insecure file handling may result in local privilege escalation.

  Description: When certain environmental variables are set to enable debugging of application memory allocation, files with diagnostic information are created insecurely. This could allow a malicious local user to alter arbitrary files. This update addresses the issue by disallowing malloc debugging in privileged programs. Credit to Ilja van Sprundel of Suresec LTD for reporting this issue.

- **QuickDraw Manager**

CVE-ID: CAN-2005-2744

Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.2, Mac OS X Server v10.4.2

Impact: Viewing a maliciously-crafted PICT image may result in arbitrary code execution.

Description: By carefully crafting a corrupt PICT image, an attacker can trigger a buffer overflow in QuickDraw Manager which may result in arbitrary code execution. Several components of Mac OS X utilize QuickDraw Manager, including Safari, Mail, and Finder. This update addresses the issue by performing additional validation of images. Credit to Henrik Dalgaard of Echo One for reporting this issue.

- **QuickTime for Java**

  CVE-ID: CAN-2005-2743

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9

  Impact: An untrusted applet may gain elevated privileges.

  Description: The Java extensions bundled with QuickTime 6.52 and earlier allow untrusted applets to call arbitrary functions from system libraries. This update addresses the issue by limiting these calls to trusted applets. Systems running QuickTime 7 or later are not affected by this issue. Systems running Mac OS X v10.4 or later are also not affected by this issue. Credit to Dino Dai Zovi for reporting this issue.

- **Ruby**

  CVE-ID: CAN-2005-1992

  Available for: Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: Ruby applications utilizing the xmlrpc module may be vulnerable to arbitrary code execution.

  Description: The Ruby xmlrpc/utils module utilizes the method Module#public_instance_methods to determine which methods may be invoked remotely using XML-RPC. A change between different versions of Ruby caused this method list to unintentionally include methods that may be used to execute arbitrary Ruby code. This update addresses the issue by updating the xmlrpc/utils module. This issue does not affect systems prior to Mac OS X v10.4.

- **Safari**

  CVE-ID: CAN-2005-2524

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9

  Impact: Maliciously crafted web archives could potentially allow cross-site scripting.

  Description: It is possible to view web archives served from remote sites in Safari. Maliciously crafted web archives may be rendered as content from sites they did not server them. This update prevents remote web archives from being loaded. Safari web archives were introduced in Safari 2.0. This issue was resolved in Mac OS X v10.4.2 by Security Update 2005-007.

- **SecurityAgent**

  CVE-ID: CAN-2005-2742

  Available for: Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: A user with physical access to the system may be able to bypass the "Require password to wake this computer from sleep or screen saver" setting.

  Description: Under certain situations, the "Switch User..." button may appear even though the "Enable fast user switching" setting is disabled. This could cause the currently logged-in user's desktop to be displayed without authentication. This update prevents the "Switch User..." button from appearing when inappropriate. This issue does not affect systems prior to Mac OS X v10.4. Credit to Luke Fowler of the Indiana University Global Research Network Operations Center for reporting this issue.

- **securityd**

  CVE-ID: CAN-2005-2741

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: Malicious users may grant themselves rights to manipulate arbitrary files or perform other privileged actions.

  Description: Authorization Services allows unprivileged users to grant certain rights that should be restricted to administrators, which may lead to privilege escalation. This update addresses the issue by adding restrictions to which rights unprivileged users can grant themselves.

Additional information

Also included in this update are enhancements to LoginWindow for improved interaction with Parental Controls (Mac OS X v10.3.9), X509Anchors to include the Wells Fargo root certificate (Mac OS X v10.3.9), and Safe Download Validation to include Web Archives (Mac OS X v10.4.2).

Mac OS X Server 10.4 or later: Enabling Spotlight Web Search

This article has been archived and is no longer updated by Apple.

This article supersedes the discussion of mod_spotlight_apple in the Web Technologies Admin Guide.

Mac OS X Server 10.4 no longer supports the Sherlock-based searching capability provided by the mod_sherlock_apple Apache module and the indexfolder command-line tool. The Spotlight-based mod_spotlight_apple Apache module replaces it. Like its predecessor, it allows web browsers to search the content of your website.

Note that the indexing function of Spotlight is disabled by default in Mac OS X Server 10.4. Thus if you want to provide Spotlght-based search capability for Web Service, you must take the following steps.

Enable Spotlight indexing

To enable indexing for a volume, use the mdutil tool in Terminal. For example, to enable it on the root volume:

```
sudo mdutil -i on /
```

See the man page for mdutil(1) for further information. Note that there may be performance implications. Indexing must remain enabled for the Spotlight Web Search facility to operate.

Import content

Next, import your web content into the Spotlight MetaData store. The /Library/WebServer/Documents folder is not normally monitored by the MetaData Import processes, so you will need to manually import it, both initially and whenever you want any changes to be reflected. It's a good practice to create a different folder or folders to hold the contents of your virtual hosts; you'll need to manually import and update those as well.

This is done with the mdimport command-line tool:

```
sudo mdimport -f /Library/WebServer/Documents/example-vhost/
```

The "-f" option is necessary to force the mdimport tool to process the contents of the specified folder. Note that it may take some time to import large volumes of content. See the man page for mdimport(1) for more detail.

A variety of mdimporter extensions are pre-installed for most common content formats. If you have custom document formats, they may not be supported.

In Server Admin...

Enable the mod_spotlight_apple module in Server Admin's Web panel, and make sure Web Service is enabled. As always, it's a good idea to make sure the Web Performance Cache is enabled only if you have a specific need for it.

Copy the template.spotlight file

Copy the template.spotlight file from /Library/WebServer/Documents into the Document Root of each virtual host for which you want the spotlight search to be available. You may customize the title, maximum allowed hits, and other aspects of the presentation by modifying the copy of this file.

Access from clients

To access the search capability, instruct your web clients to append ".spotlight" to the URL for your virtual hosts, like this:

```
httpd://vhost1.example.com/.spotlight
```

This presents a simple search page that performs a content search on the contents of the DocumentRoot for the virtual host. Results are sorted with the most relevant hit first, although no relevance score is presented.

Mac OS X Server 10.4: Installing from discs to remote computers

This article has been archived and is no longer updated by Apple.

When you start up a computer from a Mac OS X Server Installation disc, SSH also starts so that you can perform remote installations.

Because SSH gives others access to the disc-booted computer over the network, you should make sure that your network connection is secure. For example, connect the server computer to a subnet that's accessible only to trusted users.

iTunes Store songs won‘t transfer to a Motorola phone featuring iTunes

This article has been archived and is no longer updated by Apple.

This article does not cover iPhone support in iTunes. For more information about iPhone support in iTunes, click here.

If music you purchased from the iTunes Store will not transfer to a Motorola phone featuring iTunes, please note the bit rate of the song (see below) and visit the following web page to contact iTunes Store Customer Service:
http://www.apple.com/support/itunes/musicstore/songs/

Scroll to the bottom of the page, complete the entire form, and click submit. In the menu where you are asked to "Please select a question," choose "I can't play one or more purchased songs." Also, be sure to include the name of the song(s) that cannot be transferred, the bit rate of the song(s), as well as the exact or approximate purchase date.

To find the bit rate of the song:

1. Select one of the purchased songs that is not transferring.
2. From the **File** menu, choose **Get Info**.
3. Click the Summary tab. The bit rate appears on the left side of the window.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Mac OS X 10.4: Fax options don‘t appear when faxing

This article has been archived and is no longer updated by Apple.

Whenever you send a fax in Mac OS X 10.4 or later, you should typically see several options available in the fax dialog that allow you to send a cover page, use tone or pulse dialing, or even schedule what time to send the fax. However, if you haven't added a printer to the printer list, these options will not appear, and the only choice you'll have in the third pop-up menu (below presets) will be **Item 1**.

To resolve this issue, just add a printer to the printer list in System Preferences, if one is available. Once you do, the fax options will appear when you fax.

If you don't have a printer, follow these steps as a workaround:

1. From the **Apple** menu, choose **System Preferences**.
2. Click Print & Fax to display the preference pane.
3. Click the Printing tab.
4. Click the plus sign (+) button to add a printer.
5. In the resulting Printer Browser window, click IP Printer.
6. From the **Protocol** pop-up menu, choose **Line Printer Daemon - LPD**.
7. Type `127.0.0.1` in the Address field.
8. From the **Print Using** pop-up menu, choose **Generic PostScript Printer**.
9. Click Add.

This document will be updated as more information becomes available.

iMovie HD: Can trim clips in timeline only if clip volume levels are not displayed

This article has been archived and is no longer updated by Apple.

If you use the direct trimming feature in iMovie HD, you'll need to hide the clip volume levels first. This applies to direct trimming both audio and video clips in the timeline.

You can hide the clip volume levels by choosing **Show Clip Volume Levels** from the **View** menu to deselect (uncheck) the feature.

Power Mac G5 (Early 2005): Power consumption and thermal output (BTU) information

This article has been archived and is no longer updated by Apple.

Learn about the power consumption and thermal output of Power Mac G5 (Early 2005) computers.

Dual 2.0 GHz Power Mac G5 (Early 2005)
1 GHz frontside bus/processor, 512K L2 cache/processor, 512MB PC3200 (400MHz) DDR400 SDRAM, expandable to 4GB, SDRAM, 160GB Serial ATA drive, 16x SuperDrive (DVD+R DL/DVD±RW/CD-RW), 3 PCI slots, ATI Radeon 9600 with 128MB DDR SDRAM

Power Consumption		Thermal Output	
Idle	**CPU Max**	**Idle**	**CPU Max**
120 W	450 W	410 BTU/h	1535 BTU/h

Dual 2.3 GHz Power Mac G5 (Early 2005)
1 GHz frontside bus/processor, 512K L2 cache/processor, 512MB DDR400 SDRAM, expandable to 8GB SDRAM, 250GB Serial ATA drive, 16x SuperDrive (DVD+R DL/DVD±RW/CD-RW), Three open full-length PCI-X slots: one 133MHz, 64-bit slot and two 100MHz, 64-bit slots, ATI Radeon 9600 with 128MB DDR SDRAM

Power Consumption		Thermal Output	
Idle	**CPU Max**	**Idle**	**CPU Max**
120 W	450 W	410 BTU/h	1535 BTU/h

Dual 2.7 GHz Power Mac G5 (Early 2005)
1.35 GHz frontside bus/processor, 512K L2 cache/processor, 512MB DDR400 SDRAM, expandable to 8GB SDRAM, 250GB Serial ATA drive, 16x SuperDrive (DVD+R DL/DVD±RW/CD-RW), Three open full-length PCI-X slots: one 133MHz, 64-bit slot and two 100MHz, 64-bit slots, ATI Radeon 9650 with 256MB DDR SDRAM, one single-link and one dual-link DVI port

Power Consumption		Thermal Output	
Idle	**CPU Max**	**Idle**	**CPU Max**
140 W	600 W	478 BTU/h	2047 BTU/h

Notes

- Power consumption data (Watts) is measured from the wall power source and includes all power supply and system losses. Additional correction is not needed.
- "CPU Max" is defined as running a compute-intensive test application that maximizes processor usage and therefore power consumption.
- These numbers reflect a 23° C (73.4° F) ambient running environment. Increased ambient temperatures will require faster fan speeds which will increase power consumption. At 35° C (95° F), 50 W should be added to reflect increased power consumption.

Mac OS X Server 10.4 or later: Can‘t write to folder after allowing write access in ACL

This article has been archived and is no longer updated by Apple.

When using an access control list (ACL) to allow write access to a folder, such as a drop box, you won't be able to write to the folder unless you also allow "traverse" access.

To do this, make sure that you select the Traverse Folder (Execute File) checkbox under the "Read" permission, as shown above for a drop box.

Xsan: Don‘t set Metadata or Any Data storage pools to "Read Only"

This article has been archived and is no longer updated by Apple.

If you set a Metadata or Any Data storage pool to Read Only, you won't be able to mount the Xsan filesystem. When you try to mount it at a client, the filesystem will stop and a "PANIC" error message will appear in the cvlog.

To avoid this issue, never set a Metadata or Any Data pool to Read Only. To work effectively, Xsan must be able to write to these pools.

Mac OS X 10.4.2: Network view doesn‘t show network shares or won‘t open at all

This article has been archived and is no longer updated by Apple.

If you've enabled automatic login for your user account, you may experience some issues with the Network view in the Finder.

If you choose **Network** from the **Go** menu in the Finder, the resulting window may not open or it may open briefly and then close unexpectedly. If you open a Finder window and select Network in the sidebar (or browse to /Network), you may only see the Applications, Library, and Users folders.

As a workaround, turn off automatic login, or log out of your account and then log back in.

This document will be updated as more information becomes available.

Final Cut Pro does not allow simultaneous editing of a project file from multiple workstations

This article has been archived and is no longer updated by Apple.

If you save a Final Cut Pro 5 project, stored on an Xsan 1.x volume, that was previously saved from another workstation during an editing session, you may receive one of two errors, depending on your Directory Services configuration:

> "File Error: Access Denied"

or

> "The project "*projectName*" has been modified externally. If another user is working on it, saving will overwrite their changes. Do you still want to save?"

If you receive the previous of these two errors, it could be that you do not have permissions to edit the project file. For more information on managing permissions for files stored on an Xsan volume, click here.

If you receive the latter of these two errors, an editor at one workstation with the same user ID (UID) as the editor at the workstation receiving the error has saved the project during the editing session. You should not allow two users with the same UID to access an Xsan volume at the same time. For more information on how to create user accounts with unique UIDs, see the Xsan Administrator's Guide.

To avoid receiving these errors when saving project files that are stored on an Xsan volume, adjust your site's workflow to prevent multiple editors from simultaneously editing a project file. To do so, store the Final Cut Pro project files on the Xsan volume, but use Affinities to prevent editors from accessing each other's project files. To learn more about configuring Affinities, see the Xsan Administrator's Guide.

Mac OS X 10.4.2: Computer becomes unresponsive during heavy Internet activity

This article has been archived and is no longer updated by Apple.

If you're using Mac OS X 10.4.2 with a broadband Internet connection, your computer may stop responding ("freeze") during heavy Internet activity or when you're browsing specific websites, particularly Fox News (www.foxnews.com). When this happens, your mouse pointer appears as a spinning disc. This issue may affect all applications and the Finder to the extent that not even a Force Quit works.

If you physically break the Internet connection, your computer should return to normal after a moment. To do this, disconnect the Ethernet cable if your computer is connected by Ethernet. If your computer is connected through AirPort, unplug the base station or broadband modem from its power source.

To prevent the issue from recurring, update to Mac OS X 10.4.3 or later.

Final Cut Pro: Assemble Editing with a Panasonic VTR

This article has been archived and is no longer updated by Apple.

Symptom

If you're using a Panasonic video recorder for assemble editing (Edit to Tape) operations, you may experience a few issues with your edit In points. This can include:

- VTR doesn't go into record mode at In point
- In point occurs earlier than expected
- Duplicate frames at the In point

Solution

Update to Final Cut Pro 5.1.2 to prevent these symptoms. If you're unable to update right away, continue with the rest of this document to see possible workarounds.

VTR doesn't go into record mode at In point

If the VTR does not go into record mode when it reaches the edit In point, you may be controlling the deck with the incorrect RS-422 serial protocol.

1. Choose **Final Cut Pro** > **Audio/Video Settings**.
2. Click the Device Control Presets tab.
3. Click the Edit button.
4. If a dialog appears saying that the preset cannot be edited, click OK to make a copy of the preset.
5. From the **Protocol** pop-up menu, choose **Panasonic RS-422**.

In point occurs earlier than expected

The In point on the edited tape may occur up to three frames earlier than the timecode set as the assemble edit In point. If this happens, you can work around the issue by adding frames to your intended edit point. For example, if you want your edit In point to occur at 00:58:30:00 but the actual edit comes in three frames earlier, enter an In point of 00:58:30:03 in the Edit To Tape window to offset the discrepancy.

Duplicate frames at the In point

If you see duplicate video frames at the edit In point:

1. Choose **Final Cut Pro** > **Audio/Video Settings**.
2. Click the Device Control Presets tab.
3. Click the Edit button.
4. If a dialog appears saying that the preset cannot be edited, click OK to make a copy of the preset.
5. Adjust the value for Playback Offset so that it eliminates the extra frames. As a starting point, enter a value equal to the number of duplicated frames you observed on the edited tape, then adjust as necessary.

For more information on the settings covered in this article, refer to the Final Cut Pro User's Manual under the **Help** menu.

Cinema Tools and Final Cut Pro: Limit file size for reverse telecine

This article has been archived and is no longer updated by Apple.

When performing reverse telecine to remove pull-down, avoid using large files wherever possible. In some cases, large files may result in issues with timing and audio sync. For the best results, use files that are under 9 GB for reverse telecine.

If you have larger files, you should split them or recapture them as smaller files before performing reverse telecine.

This document will be updated as more information becomes available.

Mac OS X: Resolving permissions (umask) issues in a server-based group folder environment

This article has been archived and is no longer updated by Apple.

Note: This article assumes that you know how to read permissions values such as "775." If you don't, please review this article first to learn how.

Each operating system has a default permission value (such as 755 in Mac OS X 10.4) that it assigns to files and folders. Default permissions exist to ensure that the appropriate users have correct levels of access to a file in the most common situations and thus represent a balance of security and access.

In Mac OS X and other POSIX-based systems, a value known as a *umask* is subtracted from the system's maximum permissions value (typically 777) to determine the default permission value of a newly-created file. For example, a umask of 022 will typically result in a default permission of 755. The umask can play a role in a group working environment, such as sharing files in a group folder on a server.

By enabling or disabling a scheme generally known as *inherited permissions* (the exact name varies from one operating system to another), the server administrator decides whether the permissions of files written to the server will be determined by the permissions scheme of the client writing the file or by the server itself.

In a cross-platform environment, it's important to note that Windows-based systems don't employ a umask. Rather, Windows clients set the permissions of a file to match those of the target directory, regardless of whether or not the server is enforcing inherited permissions. Here's a common scenario:

1. The administrator sets up an SMB server with inherited permissions disabled and a group folder with a permission value of 775.
2. A Windows XP client saves a JPEG file to the group folder on the server, adopting the 775 permission from the server.
3. A Mac OS X 10.4 client with a umask value of 022 opens the file and saves it, resulting in a permission of 755.
4. The Windows XP client subsequently cannot save the file.

This happens because the Mac OS X client's umask of 022 wrote the file back to the group folder without group write permission (775 includes group write; 755 does not). Because inherited permissions were disabled on the server, the server did nothing to control the situation.

Using inherited permissions

To resolve this issue, make sure that you enable inherited permissions on the server (it's generally recommended that you **not** manipulate umasks, as unintended and possibly severe consequences may occur). Inherited permissions simply means that the files within a group folder will take on the permissions of the group folder itself, so that everyone in the group will be able to open and save the group files.

Had inherited permissions been enabled in the example above, the SMB server would have overridden the permissions written by the Mac OS X client, so that the Windows XP client would be able to save the file.

Depending on the server, you can enable inherited permissions for individual folders or entire shares. Consult your server documentation for instructions on how to enable inherited permissions.

Note: Inherited permissions is not a feature of Personal File Sharing in Mac OS X. If you're using Personal File Sharing in a workgroup environment, you should consider purchasing Mac OS X Server to enjoy a full server feature set.

iSync: First and last name fields show up as dots or dashes on phone

This article has been archived and is no longer updated by Apple.

When syncing with some phones, including Sony Ericsson phones, if you have a contact in your Address Book that contains a company name, but no first or last name, this contact will appear to have dots or hyphens for a first and last name when viewed on the phone. For example, ". . Apple Computer" or "- - Apple Computer".

This means the phone requires a first and last name field to be filled. Any version of iSync realizes this, so it adds a dot or hyphen to each blank name field for you. You don't have to do anything else—it's just something to be aware of.

Final Cut Pro 5: Issues with setting an initial Scratch Disk

This article has been archived and is no longer updated by Apple.

The first time you open Final Cut Pro 5, a dialog opens, prompting you to set the location for the Primary Scratch Disk. Your scratch disk setting determines the location for video files used by Final Cut Pro, such as video that you capture and video that Final Cut renders. The default location is ~/Documents/Final Cut Pro Documents.

The dialog looks like this:

You can use the **Primary Scratch Disk** pop-up menu to choose a hard drive or a folder as your scratch disk location. However, there are two situations in which the dialog may act unexpectedly:

- If you set the location to be a folder on your startup drive, the setting will revert back to the default location.
- If you leave the setting as is, Final Cut will not set the location to the root level of your startup drive (as indicated by the initial menu setting); it maintains the default location in your user folder (~/Documents/Final Cut Pro Documents).

Once Final Cut Pro opens, you can work around these issues by choosing **Final Cut Pro > System Settings** and then clicking the Scratch Disks tab. You can then change the settings to your liking.

For more information on setting Scratch Disks and other initial settings, refer to the Final Cut Pro User Manual, available under the Final Cut Pro **Help** menu.

This document will be updated as more information becomes available.

Mac OS X: Email notification doesn‘t get sent after fax is received

This article has been archived and is no longer updated by Apple.

In Mac OS X 10.3 or later, you can set Print & Fax preferences to email a notification whenever your computer receives a fax. However, if you don't have a static IP address from your ISP, you might not get the email, even though the fax arrives just fine and your computer can connect to the Internet.

If you're in this non-static IP address situation, here are a few workarounds:

- Try a third-party application, such as FaxEmailHelper. (Please refer to the documentation that comes with the software for any important information.)
- Set up and attach a folder action script to the Shared Faxes folder that automatically emails the received fax as an attachment. Please note that this won't work if there are no users logged in to the computer.
- Have your computer print the fax automatically on arrival, or set up an onscreen notification action that displays a message when a fax arrives. Find out how to do both in this article.

This document will be updated as more information becomes available.

Important: Mention of third-party websites and products is for informational purposes only and constitutes neither an endorsement nor a recommendation. Xsan: Users can‘t modify each others‘ files by default

This article has been archived and is no longer updated by Apple.

By default, files and folders saved to an Xsan volume are read-only for other users.

Xsan 1.3 or earlier: If desired, you can use Get Info in the Finder to give other users write access to files or folders that you've saved to an Xsan Volume.

For Xsan 1.4 or later: If your Xsan Clients are running Mac OS X 10.4 or Mac OS X Server 10.4 and are using Open Directory for directory services, Access Control Lists can be used to manage permissions on files and folders saved to the Xsan volume. For information about configuring ACLs for Mac OS X and Xsan, refer to the Xsan Admin Guide and the Mac OS X Server File Services Administration Guide: (http://images.apple.com/server/macosx/docs/File_Services_Admin_v10.5.pdf)

Note: See this article if using Xsan in conjunction with Stornext clients.

Save some time

If you're comfortable with AppleScript, you can create a script (see below) that'll add the group write permission for you instead of using Get Info. Once you've got the script, simply drop a file onto the script in the Finder and it'll add the group write permission. To create the script, copy this text into Script Editor and edit it as needed:

```
on open foo
   try
    repeat with x from 1 to number of items in foo
    set foo2 to item x of foo
     set the foo3 to the quoted form of the POSIX path of foo2
     do shell script ("/bin/chmod -R g+wX " & foo3)
    end repeat
   end try
end open
```

If you'd prefer to provide write access to users in your group and to all other users, replace the line:

```
do shell script ("/bin/chmod -R g+wX " & foo3)
```

with:

```
do shell script ("/bin/chmod -R go+wX " & foo3)
```

When you save the script, be sure to save it as an Application.

Mac OS X 10.4: Mail account sync alert can be safely ignored

This article has been archived and is no longer updated by Apple.

You can sync your Mail rules and accounts between different Macs using .Mac in Mac OS X 10.4 Tiger. However, you may get an inaccurate alert that states more changes are going to take place than are required.

This message appears when your Mail accounts aren't listed in the same order across your synchronized Macs. You can either safely ignore the alert or you can reorder your Mail accounts as a workaround.

Ignore It

If you choose to simply ignore the erroneous sync alert and apply the changes, the alert will continue to appear whenever you sync your Mail data, but you can keep ignoring it.

The Workaround

If you want to prevent the alert, arrange your Mail accounts so that they are in the same order on each Mac that you sync through .Mac.

For example, if Mac A has Mail accounts listed in this order...

- Home
- Work
- Kids

... and Mac B has Mail accounts in this order...

- Work
- Home
- Kids

... then the inaccurate alert will appear. To fix this, rearrange the order of the accounts on one of the Macs so that it's the same on both:

1. Open Mail.
2. From the **Mail** menu, choose **Preferences**.
3. Click Accounts.
4. On the left side of the window, drag an account's name up or down in the list and drop it in the desired location.
5. Repeat until all accounts are listed in the same order on each computer that you sync through .Mac.

Related Terms: error, synchronize

Logic Pro/Express 7.1.1 update doesn‘t work in Mac OS X 10.4 and 10.4.1

This article has been archived and is no longer updated by Apple.

Installing the Logic Pro or Logic Express version 7.1.1 update works fine in Mac OS X 10.3.9 and 10.4.2 and later, but it won't work in earlier Tiger builds (10.4 and 10.4.1). When you try to update Logic 7.1 to version 7.1.1 on a computer with Mac OS X 10.4 or 10.4.1:

- Software Update will not detect or offer the Logic update.
- The standalone installer will erroneously state that it can't find an eligible Logic application in the Applications folder.

To resolve the issue, Tiger users should update to 10.4.2 or later, then reapply the Logic 7.1.1 update.

Mac OS X 10.3 to 10.4.2: Applications in the Drop Box won‘t open

This article has been archived and is no longer updated by Apple.

If you enable Personal File Sharing on your computer and other users log in to copy applications to your computer, it's possible that an application in your Drop Box folder won't open. This happens when a user connected as "guest" copies an actual application file to your computer.

For a guest to leave you a working application, he or she should make an archive of the application and then copy the archive to your Drop Box instead of the original application.

To create an archive of any file or application, select it in the Finder, Control-click it, and choose **Create Archive of "*File_Name*"** from the shortcut menu. When you receive an archived application, just double-click it in the Finder to unarchive it, then double-click the resulting file to open the application.

This document will be updated as more information becomes available.

Power Macintosh G3 & G3 All-in-one: Video RAM Upgrade

This article discusses upgrading the VRAM for the Power Macintosh G3.
This article has been archived and is no longer updated by Apple.
The Power Macintosh G3 and G3 All-in-one includes 2 MB of SGRAM on the main logic board. The video RAM can be expanded to 4 MB or 6 MB with an additional 2 MB or 4 MB of SGRAM on a 144-pin SO-DIMM (small outline dual inline memory module). This module is an industry standard upgrade that is also commonly used in PC computers. Some configurations ship with a VRAM module already installed.

Note: The only way to obtain a VRAM upgrade from Apple, is to order the upgrade at the time of purchasing a Build To Order computer from the Apple Store or purchase a configuration with expanded VRAM. Apple does not sell separately a VRAM upgrade for the Power Macintosh G3. VRAM upgrades must be purchased from third-party vendors.

The mechanical characteristics of the VRAM expansion DIMM are 144-pin 8-byte graphics SGRAM SO-DIMM, 3.3 V, 83 MHz/12 ns or faster.

Note: The internal display on the Power Macintosh G3 All-in-one does not support all resolutions listed on the chart, although the video controller does. To select a resolution other than those supported by the internal display, an external monitor that supports the resolution will have to be connected.

Screen Resolution, in Pixels	Vertical Refresh, Hz	Horizontal Refresh, kHz	Maximum Number of Colors		
			2 MB SGRAM	4 MB SGRAM	6 MB SGRAM
512 x 384	70	31.488	16.7 Million	16.7 Million	16.7 Million
640 x 480	60	31.469	16.7 Million	16.7 Million	16.7 Million
640 x 480	67	35.000	16.7 Million	16.7 Million	16.7 Million

iMac G5 (iSight): Memory specifications

This article has been archived and is no longer updated by Apple.

iMac G5 (iSight) comes with a 512 MB DDR2 SDRAM module built into the logic board that can't be removed or replaced. It also has one additional RAM slot that can support up to 2 GB of memory (you can install a 512 MB, 1 GB, or 2 GB module in this slot). You must use a memory module (DIMM) that meets all of these criteria:

- PC2-4200
- unbuffered
- nonparity
- 240-pin
- 533 MHz
- DDR2 SDRAM

DIMMs that have any of the following features are not supported in the iMac G5 (iSight):

- registered or buffered
- PLLs
- ECC
- parity
- EDO RAM

If you use System Profiler (find it in /Applications/Utilities) to view the memory, the DIMM slots for the iMac G5 (iSight) are identified as follows:

When upgrading memory, always follow the installation instructions exactly as written. Never attempt to remove screws that are not listed in the instructions.

For more information about upgrading your iMac G5 (iSight) memory, see "iMac G5 (iSight): Installing and replacing memory (RAM)."

Mac OS 8: Upgrading Workgroup Server 9650 & 7350 Software

The following steps should be taken when planning to upgrade your Workgroup Server 7350 or 9650 to Mac OS 8. The steps may include updating specific components of the server Mac OS as well as bundled Apple and third-party software.
This article has been archived and is no longer updated by Apple.

Workgroup Server 7350 and 9650

1. If you have the Apple RAID hard disk driver installed, update to Apple RAID 1.5.3. - After performing the update to Apple RAID 1.5.3, launch Apple RAID and then install/update the driver on every Apple RAID disk. Make sure to install the new driver on every disk under the disks column.

2. Boot the server from the Mac OS 8 CD. Install Mac OS 8, following the installation instructions on the CD. If you updated the hard disk drivers as per instruction 1, you will get a dialog informing you that the drivers can not be updated. It is safe to ignore this warning.

3. Update to AppleShare IP 5.0.2. - Be sure to follow the installation instructions documented in the AppleShare IP Updater Read Me.

4. Update to Open Transport 1.2.1. This updater is part of the AppleShare IP Update archive.

5. Update to RunShare 3.0.1.

6. Install WGS SCSI Update 2.0. This updater is part of the WGS Mac OS 8 Update archive. Drag copy this file into the System Folder of the server.

7. Restart the server, with the Mac OS 8 CD removed from the drive. If you have a Workgroup Server 9650, continue to the appropriate 9650 model's section below.

Workgroup Server 9650/233

Note: The Workgroup Server 9650/350 ships with several Mac OS components which are not included in the base Mac OS system software. In order to update your server to Mac OS 8, you must follow these additional steps.

1. Insert the Workgroup Server Software CD in the drive.

2. Install the PCI Card Driver for the SCSI JackHammer card that is on the CD.

Workgroup Server 9650/350

Note: The Workgroup Server 9650/350 ships with several Mac OS components which are not included in the base Mac OS system software. In order to update your server to Mac OS 8, you must follow these additional steps.

1. Insert the Workgroup Server Software CD in the drive.

2. Install PCI Card Drivers on WGS CD - Locate and Open the 'Server Additions' folder on the CD.

3. Move the following drivers from the 'For System Folder' folder to the active System Folder:
- PCI SCSI JackHammer=81 1.2.2
- Apple 10/100 Fast Ethernet

4. Install Xclaim 3D video card software - Open the Xclaim 3D Installer folder that's also in the 'For System Folder' folder. Install the Xclaim software following the instructions in the Read Me file.

Compressor 2: Certain presets may set the wrong frame rate in a converted clip

This article has been archived and is no longer updated by Apple.

Compressor 2 offers high-quality transcoding using advanced image analysis when converting from one format to another. However, if you try to transcode from PAL to NTSC using one of the NTSC presets in the Advanced Format Conversions category, the resulting QuickTime movie file may not have the correct frame rate (29.97 FPS).

As a workaround, do this:

1. In Compressor, apply the setting you wish to use to the source clip in the Batch window.
2. In the Inspector window, select Frame Controls.
3. From the **Frame Controls** pop-up menu, choose **Custom**.
4. Set your destination and then submit the batch.

After changing the Frame Controls, you can save the setting if you'd like to use it for future PAL to NTSC transcoding. You can then use your new setting instead of the default setting to make the conversion.

This document will be updated as more information becomes available.

Mac OS X 10.4.3: Allowing non-admin users to change the time zone setting

This article has been archived and is no longer updated by Apple.

In Mac OS X, a user who isn't an administrator cannot change the time zone setting in System Preferences without authorization. In this advanced article, learn how an administrator can use Mac OS X 10.4.3 or later to change the `/etc/authorization` file so that a non-admin user can adjust the time zone setting.

Please note that this will not affect other settings in the Date and Time preferences or other secured System Preferences settings.

Important: This article contains instructions for editing the `/etc/authorization` file and is only intended for use by system administrators who are familiar with editing configuration files in a command-line interface. Misconfiguring this file can cause issues, including preventing any user from logging in. Be sure that you make a back up of the `/etc/authorization` file before editing it.

To grant time zone setting access to a non-admin user, do this:

1. Make sure that you've updated to Mac OS X 10.4.3.
2. Open the `/etc/authorization` file in a text editor.
3. Locate the text that makes up the system.preferences.accounts right; it looks like this (in its entirety):

```
<key>system.preferences.accounts</key>
<dict>
<key>allow-root</key>
<true/>
<key>class</key>
<string>user</string>
<key>comment</key>
<string>This right is checked by the Admin framework when making changes to the accounts preference
pane</string>
<key>group</key>
<string>admin</string>
<key>shared</key>
<false/>
</dict>
```

4. Below this block of text (immediately below the `</dict>` tag), add the following section of text:

```
<key>system.preferences.dateandtime.changetimezone</key>
<dict>
<key>class</key>
<string>allow</string>
<key>comment</key>
<string>This right is used by DateAndTime preference to allow any user to change the system timezone.
</string>
<key>shared</key>
<true/>
</dict>
```

   Please note that the "This right is used by..." string does not include a line break; make sure that you enter it all on one line.
5. Save the file.

Don‘t unplug the Apple USB modem while it‘s in use

This article has been archived and is no longer updated by Apple.

If you unplug the iMac G5 (iSight) or Mac mini computer's Apple USB modem from the computer while it is in use, you may find that both the modem and the USB port it was plugged into will not work anymore.

If this happens, don't fret. Just restart your computer and the USB port and modem will work normally again.

iMac G5 (iSight): Mighty Mouse right button doesn‘t work when installing Mac OS X

This article has been archived and is no longer updated by Apple.

When you're installing Mac OS X on your iMac G5 (iSight), don't use the right button on your Mighty Mouse. The installer doesn't support the right button, but the button will work once the installation is finished and the computer starts up normally. Use the left mouse button when you install Mac OS X.

This document will be updated as more information becomes available.

Photo Booth: "Unable to save photo" message when trying to save a photo

This article has been archived and is no longer updated by Apple.

If you've saved more than a couple of thousand photos in Photo Booth, Photo Booth may display an error message that says "Unable to save photo" when you try to save a new one. When you try to click OK to dismiss the message, the dialog won't go away. The only way to close the dialog is to force quit Photo Booth using Activity Monitor.

To do this:

1. In the Finder, choose **Utilities** from the **Go** menu to open the folder.
2. Open Activity Monitor.
3. In the Process Name column, select Photo Booth (click it once to highlight it).
4. Click the Quit Process button in the upper-left corner of the window.
5. A dialog opens and asks, "Do you really want to quit 'Photo Booth'?" Click Force Quit to confirm it.

If this happens, you will need to delete or move some of your photos before you can use Photo Booth again, or add more memory (RAM) to your computer.

Tips for opening and saving files in Mac OS X applications

This article has been archived and is no longer updated by Apple.

You probably know how to open and save files and documents in a Mac OS X application's File menu (or with Command-S and Command-O keyboard shortcuts), but you might not know about some other useful tricks for opening or saving files.

- When saving a file, click the disclosure triangle in the dialog sheet to see more save locations and additional options.

- In Mac OS X 10.3 or later, if you drag files or folders to a Finder window's sidebar, they will appear in the left side of an application's Open dialog sheets as well as the left side of Save dialog sheets where the disclosure triangle has been clicked (see previous tip).
- You can drag a file or folder to an application's Open or Save dialog sheet to quickly select it.
- Another option: Drag the small icon that appears on the title bar of a Finder or application's window (the "proxy icon") to the Open or Save sheet.
- Want to type a specific location path? With the Open or Save dialog sheet open, press Command-Shift-G (or type "/"). A "Go To Folder" window appears where you can type a specific location, just like the Finder **Go** menu's **Go To Folder** option.

Mac OS X 10.4.3: Cannot use Unicode Hex Input keyboard layout

This article has been archived and is no longer updated by Apple.

If you enable the Unicode Hex Input keyboard layout in the International pane of System Preferences and then choose it from the input menu, the U.S. keyboard layout will be used instead. This can happen in Mac OS X 10.4.3.

To resolve this issue, do this:

1. From the **Apple** manu, choose **System Preferences**.
2. Click International to display the pane.
3. Click the Input Menu tab.
4. Deselect (uncheck) all selected checkboxes for keyboard layouts, palettes, and input methods.
5. Reselect the checkboxes for keyboard layouts, palettes, and input methods that you wish to make available, including Unicode Hex Input.

iMac G5 (iSight) and Front Row: Error messages appear when trying to play songs

This article has been archived and is no longer updated by Apple.

If you try to play a song in Front Row on your iMac G5 (iSight) but the application can't find the song because it's not in the default iTunes library, you'll see an alert message that either says, "iTunes cannot play this song" or "Communications error." If this happens, just show Front Row where you keep your music.

If you keep all of your music in one folder location:

1. Open iTunes.
2. From the **iTunes** menu, choose **Preferences**.
3. Click the Advanced tab, then click the General tab below it.
4. Click Change next to the "iTunes Music folder location" section.
5. Navigate to and select the folder that contains your tunes.
6. Click Choose.
7. Click OK.

If your music is stored in different folder locations:

1. Open iTunes.
2. From the **Advanced** menu, choose **Consolidate Library** to copy songs from all locations to your default iTunes Music folder. Let the consolidation process finish before you go back to Front Row.

Tip: If you want to play just one song from another folder, play the song in iTunes first. Front Row will be able to find it once iTunes knows where the song is located.

Mac OS X Server Weblog Service: Modifying XML templates for the iTunes Store

This article has been archived and is no longer updated by Apple.

Mac OS X Server 10.4.3 or later supports RSS2 enclosures and podcasting. Although the server includes the basic RSS2 tags needed for podcasting, it doesn't include the required tags to submit podcasts to the iTunes Store. This article shows how to modify the RSS2 template so that blog entries from the Weblog Server can be considered for publication on the iTunes Store.

To find more information about the iTunes-specific RSS2 tags, click here.

Note: This advanced how-to requires you to edit XML-formatted text files. Apple does not provide any further technical support or assistance with performing this task.

Part I: Modifying the RSS2.vm template

1. Log in as an administrator of the server.
2. Make a backup copy of the file:

```
/Library/Tomcat/blojsom_root/webapps/ROOT/WEB-INF/templates/rss2.vm
```

3. Open TextEdit.
4. Open the following file in TextEdit:

```
/Library/Tomcat/blojsom_root/webapps/ROOT/WEB-INF/templates/rss2.vm
```

5. Locate the first <image> section below the opening <channel> tag. This is where you need to insert your blog server's iTunes Store channel attributes. Using the default rss2.vm file, here is an example of what this looks like (our inserted text is shown in blue):

```
<?xml version="1.0"?>
<!-- name="generator" content="$BLOJSOM_VERSION" -->
<rss version="2.0" xmlns:dc="http://purl.org/dc/elements/1.1/"
xmlns:wfw="http://wellformedweb.org/CommentAPI/" xmlns:itunes="http://www.itunes.com/dtds/podcast-1.0.dtd">
 <channel>
  <title>$BLOJSOM_BLOG.getBlogName()</title>
  <link>$BLOJSOM_BLOG.getBlogURL()</link>
  <description>$BLOJSOM_BLOG.getBlogDescription()</description>
  <language>$BLOJSOM_BLOG.getBlogLanguage()</language>
  <image>
   <url>$BLOJSOM_SITE_URL/favicon.ico</url>
   <title>$BLOJSOM_BLOG.getBlogName()</title>
   <link>$BLOJSOM_BLOG.getBlogURL()</link>
  </image>
  <itunes:author>www.demo.edu</itunes:author>
  <itunes:owner>
   <itunes:name>Demo University</itunes:name>
   <itunes:email>podcast@demo.edu</itunes:email>
  </itunes:owner>
  <itunes:link rel="image" type="video/jpeg" href="http://www.demo.edu/demo_u.jpg">About Demo University</itunes:link>
  <itunes:category text="Education">
   <itunes:category text="Higher Education"/>
  </itunes:category>
  <copyright>Copyright 2005 demo.edu</copyright>
```

6. Now locate the first <description> tag line below the opening <item> tag. This is where you need to insert the iTunes Store attribute tags. Using the default rss2.vm file, here is an example of what this looks like (again, our inserted text is shown in blue):

```
#foreach ($entry in $BLOJSOM_ENTRIES)
  <item>
  <title>$entry.getEscapedTitle()</title>
  <link>$entry.getEscapedLink()</link>
  <description>$entry.getEscapedDescription()</description>
  <itunes:author>$BLOJSOM_BLOG.getBlogOwner() from demo.edu</itunes:author>
  <itunes:subtitle>Boost your knowledge at Demo University</itunes:subtitle>
  <itunes:summary>Episodes from demo University.</itunes:summary>
  <itunes:category text="Education">
   <itunes:category text="Higher Education"/>
  </itunes:category>
  <itunes:explicit>no</itunes:explicit>
  <itunes:keywords>education college university lecture</itunes:keywords>
```

Note: In the example above, we're editing the default rss2.vm file. As a result, all of the information above is static except for the variable used for the blog owner. When editing the default rss2.vm file, all information will be the same for every item of every blog on the server. However, you can make a blog-specific template and use it to override the default, thus achieving different RSS templates for different blogs.

To create a template that's specific to a user's blog, create a new "templates" folder in the user's blog folder:

```
/Library/Tomcat/blojsom_root/webapps/ROOT/WEB-INF/<username>/templates
```

If you put a modified copy of rss2.vm in the folder, the weblog server will use that template instead of the one in /WEB-INF/templates, because the user-

specific file takes precedent over the main template when present. With this method, only the information in that specific blog will have the customized tags.

Part II: Test your blog site

To test your blog site to make sure that the RSS2 links function properly, go to a blog and click on the RSS2 or RSS Podcast links. You shouldn't see any of the tags or information you entered. These tags are only used by the iTunes Store. If any of the information is displayed incorrectly, revise your edits in the RSS2.vm file or revert to the backup copy you made.

Tip: You can see your custom tags by using the command-line utility curl. In Terminal, type:

```
curl "http://<server address>:<port>/weblog/<user shore name>/?flavor=rss2"
```

For example, let's say your server address is www.demo.edu, it's running on port 80, and your user's shortname is "joe." You'd then type this curl command in the Terminal:

```
curl "http://www.demo.edu/weblog/joe/?flavor=rss2"
```

This will return the RSS2 xml text from the web server. The custom iTunes Store tags should be returned.

Part III: Submit your blog for consideration on the iTunes Store

1. See this article for details about publishing to the iTunes Store.
2. To submit your blog site for iTunes Store consideration, use this URL format:

   ```
   http://<server address>:<port>/weblog/<user shore name>/?flavor=rss2
   ```

   For example, if your server address is www.demo.edu, running on port 80, and your user's shortname is "joe," you'd submit this URL:

   ```
   http://www.demo.edu/weblog/joe/?flavor=rss2
   ```

iDVD: OneStep DVD not available for HDV format

This article has been archived and is no longer updated by Apple.

The OneStep DVD feature in iDVD 5 enables you to quickly transfer your video onto a DVD. Please note that this feature only works with DV format footage. If your camera records video in the high-definition HDV format, you can use iMovie HD to capture all the footage from your camera and then use iDVD to burn the video to DVD.

To do this:

1. Connect your DV camera to your computer.
2. Turn on the camera (no need to rewind the tape).
3. Set the camera to VTR mode.
4. Open iMovie HD and click the "Make a Magic iMovie" button, or choose **Make a Magic iMovie** from the **File** menu (close any open projects first).
5. Click the Video format triangle and set the video format to HDV 1080i or HDV 720p, depending on your camera's format.

6. Type a name for the project and click Create.
7. In the resulting dialog, you can choose a transition to add between scenes and add music if you'd like. Make sure that you select the "Send to iDVD" checkbox (see the Note below), then click the Create button.

8. iMovie will capture and assemble your footage and send the movie to iDVD. When iDVD opens, you can change the theme and customize the project however you want.
9. When finished, click the Burn button to burn your DVD.

Note: If you'd like your movie to autoplay, don't select the "Send to iDVD" checkbox in the Magic iMovie dialog. Instead, after following the above steps, follow these steps in iMovie:

1. From the **File** menu, choose **Share**.
2. Click the QuickTime icon.
3. From the **Export to** pop-up menu, choose **Full Quality**.
4. Click Share.
5. Type a name for the exported movie and click Save.

iMovie creates a QuickTime movie. It may be necessary to resize the movie as explained in this document. Then you can then drag to your iDVD project icon in Map view.

Mac OS X 10.4: Sunday the 1st may not appear in Date & Time preferences

This article has been archived and is no longer updated by Apple.

If you use the International format region pop-up menu choice United Kingdom (System Preferences > International > Formats > Region > United Kingdom), months in which Sunday is the 1st of the month do not display Sunday in Date & Time preferences. Monday the 2nd, followed by all other days of the month, appears in the Date & Time calendar. This can happen in Mac OS X 10.4 through 10.4.2. It doesn't happen if any other region is selected in International preferences.

For example, with United Kingdom selected in the Region pop-up menu of International preferences Format tab, May 1st, 2005 and January 1, 2006 do not appear in the Date & Time preferences calendar. These months start with Monday the 2nd instead.

Solution

Download and install the Mac OS 10.4.3 Update, or later.

Mac OS X 10.4: User collection in Font Book is dimmed ("Off")

This article has been archived and is no longer updated by Apple.
In Font Book, you may come across a situation where the "User" collection in the Collection column appears dimmed with the word "Off" next to it, and you can't enable "User" from the Edit menu. This can happen after reinstalling Mac OS X 10.4 Tiger, or after manually removing items from the Fonts folder within your home folder's Library folder.

To resolve this issue, manually add a font to your Fonts folder (~/Library/Fonts), then restart your computer. The User collection should then be available in Font Book.

QuickTime for Windows: Update to QuickTime 7.0.3 for DemoShield compatibility

This article has been archived and is no longer updated by Apple.

Some programs that use Macrovision's DemoShield in their installers may not install on Windows computers that have QuickTime 7.0 to 7.0.2 installed.

To resolve this issue, install QuickTime 7.0.3 or later before running an installer that uses DemoShield. iTunes 6 and 7 does include a later version of QuickTime.

iMac G5 (iSight), iMac (Early 2006) or later, MacBook Pro: Frequently Asked Questions

This article has been archived and is no longer updated by Apple.

Got questions about the MacBook Pro, iMac G5 (iSight), iMac (Early 2006) or later? Here are answers to the most frequently asked questions about this computer.

Is Photo Booth available for my other Macintosh computers?
Photo Booth is only available with the MacBook Pro, iMac G5 (iSight) or iMac (Early 2006) or later computers.

Can I get Front Row and an Apple Remote for my other Macintosh computers?
While you can use the Apple Remote with other Apple products, such as the iPod Universal Dock, Front Row is only available with the MacBook Pro, iMac G5 (iSight), and iMac (Early 2006) or later computers.

This computer doesn't come with a built-in modem like previous models. How do I use it with my dial-up Internet connection?
If you use a dial-up connection to access the Internet, you can purchase the external Apple USB Modem as a Configure To Order option when you order your iMac or MacBook Pro. If you already got your Mac but didn't get a modem, purchasing the external Apple USB Modem is one solution. The iMac and MacBook Pro also comes with a built-in AirPort Extreme card. Combined with an AirPort Extreme Base Station (with modem), you can place the Base Station near your phone jack and place your Mac nearly anywhere you like.

Some PowerBook SuperDrives won‘t work with 8x DVD-R media

This article has been archived and is no longer updated by Apple.

Some earlier PowerBook G4 computers that have a SuperDrive with a 1x or a 2x DVD-R write speed may not be able to burn 8x DVD-R media reliably. Because of this, you should only use 2x or 4x DVD-R media.

Not sure what kind of SuperDrive you have in your PowerBook? Just do this:

1. From the **Apple** menu, choose **About This Mac**.
2. Click the More Info button to open Systen Profiler.
3. In the resulting window, select Disc Burning (under Hardware).

Your SuperDrive model number will be listed in bold at the top of the pane. If you see UJ-815 or UJ-816 as part of the model, make sure that you only use 2x or 4x DVD-R media.

This could occur with the following PowerBook models if they have the UJ-815 or UJ-816 drive:

- PowerBook G4 (1GHz/867MHz)
- PowerBook G4 (17-inch)
- PowerBook G4 (12-inch)
- PowerBook G4 (15-inch FW800)
- PowerBook G4 (12-inch DVI)
- PowerBook G4 (17-inch 1.33GHz)

Front Row: Photos will not play if nested in another folder or album

This article has been archived and is no longer updated by Apple.

If photos are nested (in a folder within another folder) in folders or albums, you may see a "communication error" or other odd behavior when you try to display them with Front Row.

To successfully view photos with Front Row, make sure that your images are contained within an album available in the iPhoto Source window. You can't view images within folders or albums that are inside of other folders or albums—those that aren't available in the Source window—unless you expand the folders in the Source window so the nested folders are visible.

Front Row: Video podcasts play audio but don‘t show video

This article has been archived and is no longer updated by Apple.

If you try to play a video podcast through Front Row but only get sound without video, it's probably because you tried to play them from the Podcasts menu in the music module. This menu item is for audio podcasts only.

To see and hear your video podcasts, access them from the Video Podcasts menu in Front Row.

Published Date: Feb 19, 2012

iMovie: Purchased videos do not work in iMovie

This article has been archived and is no longer updated by Apple.

Because all videos purchased from the iTunes Store are copyright protected, you cannot use them in iMovie. Videos that you purchase and download from the iTunes Store will appear in the Audio tab in iMovie along with your iTunes songs. However, neither the audio nor video portions of the video may be used in your iMovie project.

If you attempt to drag the video from the Audio tab into your project or if you try to preview it in the Audio tab, you may get an error due to the special copyright embedded in the video file. For example, you may see one of the following errors if you try to preview or add a purchased video in iMovie:

- **Error during audio playback**
  The file could not be played because it couldn't be opened. The file may be missing or damaged, or you may not have permission to open it.

- **Error during Import**
  The file could not be imported: The file "*file name/path*" can't be imported; QuickTime couldn't parse it: -2126

You can view videos from the iTunes Store in iTunes 7 or later, QuickTime Player 7.1.3 or later, and on iPod models that support video play.

Published Date: Oct 7, 2016

Video podcasts don‘t play as expected in Front Row

This article has been archived and is no longer updated by Apple.

Front Row provides the best video podcast viewing experience using iTunes 6.0 or later. If you're having trouble watching video podcasts, see "Video podcasts play audio but don't show video" to make sure that you're using the right menu choice.

If you are using the correct menu option but still can't see video podcasts, you may have iTunes 5.0.1 or earlier installed on your computer. To play video podcasts, be sure to download iTunes 6 or later (it's free!).

Mac OS X 10.4 (Japanese): Can‘t copy a file with a long name to an AFP Server

This article has been archived and is no longer updated by Apple.

If a file name contains more than 11 Japanese characters, Mac OS X 10.4 may not be able to copy the file to an affected AFP server—a server that is running on an operating system other than Mac OS X or Mac OS X Server.

Note: Apple Filing Protocol (AFP) is the type of service known by names such as Apple File Service (Mac OS X Server), Personal File Sharing (Mac OS X and Mac OS 9), AppleShare IP, and Microsoft Windows Service for Macintosh.

When you try to copy an affected file to an affected server, you could get the following message:

> "You cannot copy some of these items to the destination because their names are too long or contain invalid characters for the destination."

This issue may also cause unexpected loss of the file at the affected server. For example, if you copy a file from the server to your Mac OS X 10.4 client, modify the file, and then try to copy the file back to the AFP Server, you may get this message:

> "An item named 'File name' already exists in this location. Do you want to replace it with the one you are moving?"

If you click the Replace button, you will get this message:

"You cannot copy the item because the name is too long or includes characters that the disk cannot display."

The result is that you lose the old file on the AFP Server and cannot copy the edited file to the AFP Server until after you rename it.

Solution

This issue is addressed in Mac OS X 10.4.3 Update. To avoid this problem, update to Mac OS X 10.4.3 or later.

Published Date: Oct 8, 2016

About the PowerBook G4 sleep indicator light status

This article has been archived and is no longer updated by Apple.

Starting with the PowerBook G4 Double-Layer SD models, the sleep indicator light in the lid button has a new behavior.

When you first press the power button to turn on the PowerBook G4, the sleep indicator will also turn on. As the computer starts up, the indicator stays on until the display turns on.

After startup, after the system shuts down the video circuit (the screen goes dark) but before power is shut down to the main logic board, the sleep indicator light will once again turn on solid. It will turn off if the video is turned back on or it will start pulsing if the computer meets the condition for sleep.

You can use this light as a diagnostic visual to determine whether the computer is getting power at startup.

Power Mac G5 (Late 2005): Kernel panic may cause Ethernet switch to stop responding

This article has been archived and is no longer updated by Apple.

If a Power Mac G5 (Late 2005) kernel panics, it can cause an Ethernet switch to stop responding in rare circumstances. The following three events must happen consecutively to make the Ethernet switch lock up:

1. The switch must have negotiated a flow control Ethernet session with the client over Gigabit Ethernet.
2. That session must still be active.
3. The client then kernel panics.

The easiest way to resolve this issue is to prevent the kernel panics from happening. Short of that, there are two other methods to keep the switches from locking up: Turn off flow control in the Gigabit Ethernet switch, or turn off flow control on the Mac client.

To learn how to turn off flow control on the switch, please refer to your manufacturer's documentation.

To turn off flow control on the Mac client:

1. From the **Apple** menu, choose **System Preferences**.
2. Click Network to display the pane.
3. From the **Show** pop-up menu, choose **Built-in Ethernet**.
4. Click the Ethernet tab.
5. From the **Configure** pop-up menu, choose **Manually (Advanced)**.
6. From the **Speed** pop-up menu, choose **1000baseT**.
7. From the **Duplex** pop-up menu, choose **full-duplex**.
8. Click Apply Now.

Aperture: Small text appears jagged in book layouts, web journals, or metadata overlays

This article has been archived and is no longer updated by Apple.

Aperture follows your system-wide preference for text smoothing (also known as "anti-aliasing"), so some smaller fonts may appear jagged on screen. Please note that this appearance only affects what you see on your computer screen; it does not affect the final printed version, which will be smoothed regardless of your text smoothing preferences.

The default setting in Mac OS X is not to smooth fonts that are 8 points in size or smaller because some very small fonts become more difficult to read when smoothed. To experiment and see what you like best, follow these steps:

1. From the **Apple** menu, choose **System Preferences**.
2. Click Appearance to display the pane.
3. At the bottom of the window, locate the "Turn off text smoothing for font sizes `<pop-up menu>` and smaller" setting. The pop-up menu will probably be set to the default of 8.
4. Choose **4** from the pop-up menu to smooth text fonts that are 4 points and larger.

You should now see small fonts smoothed in Aperture and most other applications.

Aperture: Some images don‘t appear on light table when you drag them there

This article has been archived and is no longer updated by Apple.

In a certain situation, some images temporarily won't appear on the light table.

If the light table is selected in the project list, and you import images while it is selected, those images won't be eligible for the light table until you first visit a project or the library. They will appear in the browser, but not on the light table when you try to drag them there.

To see the images, simply click Library in the projects list, then go back to the affected light table.

This issue is resolved in Aperture 1.5.

Published Date: Oct 8, 2016

Aperture: "Rename Error" when naming an album, book, web journal, or web gallery

This article has been archived and is no longer updated by Apple.

If you try to include a period (.) when you name an album, book, web journal, or web gallery, Aperture will display this message:

> **Rename Error**
> That name is already in use. Please choose a different name.

After you click OK to dismiss the message, the period and anything following it will be omitted from the name. For example, "My.Book" would become just "My" in the name field.

Although the message is technically erroneous, the request is valid: To prevent potential naming issues, you should avoid using names that contain special characters or punctuation marks, such as periods.

For more information, see pages 49-50 of the Aperture Getting Started guide.

Learn more about naming files in a cross-platform environment.

Aperture: Only one image opens when sending multiple images to Photoshop

This article has been archived and is no longer updated by Apple.

If you select multiple images in Aperture and then try to send them to Adobe Photoshop simultaneously using the Open With External Editor command, it's possible that only one image will open in Photoshop. This behavior depends on your color settings in Photoshop.

To see your Photoshop color settings, choose **Color Settings** from either the **Photoshop** or **Edit** menu (depending on your version). In the Color Settings dialog, if you have the "Ask When Opening" checkbox selected for both "Profile Mismatches" and "Missing Profiles," this is most likely what is causing the issue:

It's up to you to decide whether or not to have the Ask When Opening feature enabled based on your own technical needs and preferences. However, if you want to send multiple images from Aperture to Photoshop, you will need to deselect both checkboxes and then click OK.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Aperture: Redeye, Spot & Patch Inspector palettes show different values than HUD

This article has been archived and is no longer updated by Apple.

The Spot & Patch and Redeye HUDs do not always show the same values as their respective palettes in the Adjustments Inspector. That's because the Adjustments Inspector shows the settings for the currently selected area in the image, while the HUD shows the value that will be used the next time you apply the tool—think of it like selecting a brush size before making the selection.

As you click on different areas of an edited image with one of the tools, the Inspector will change to show the settings for that edit, but the HUD will retain the setting that you specify for new edits.

Aperture: Update Vault doesn‘t work after restoring a vault

This article has been archived and is no longer updated by Apple.

After you restore your Library from a vault in Aperture, you may not be able to update the vault again. This can happen if you moved or renamed the vault prior to restoring it—Aperture will look for the vault by its previous name and location.

To resolve this issue, use the Update Vault Path command to point Aperture to the new vault name/location. To do this, just click the gear icon in the lower-left area of the main window, choose **Update Vault Path** from the pop-up menu, and complete the navigation dialog.

This issue is resolved in Aperture 1.5.

Published Date: Oct 10, 2016

Aperture doesn‘t display a layered Photoshop file (.psd) as expected

This article has been archived and is no longer updated by Apple.

If you import a multilayer Photoshop file (.psd) into Aperture, it may not look the way you expected. Aperture doesn't recognize layers, so it may only show one layer from the Photoshop file or nothing at all.

To prevent this, open Photoshop and choose **Preferences > File Handling**.

In the resulting dialog, choose **Always** from the **Maximize PSD and PSB File Compatibility** pop-up menu (as shown above), which will make Photoshop embed a flattened version of the image into the file that Aperture can use.

This issue is resolved in Aperture 2.x.

Published Date: Oct 10, 2016

Aperture: Some Smart Albums don‘t display any images

This article has been archived and is no longer updated by Apple.

If you put a Smart Album inside a folder and there are no other projects in that folder, the smart album will always return nothing. It may not display the expected images that meet its criteria.

This happens because you can use the location of a Smart Album to control where it will search. Additionally, a Smart Album searches actual images, not the file references (or "aliases") that reside in folders. Here's where a Smart Album will search based on its location:

Smart Album Location	Search Area
Top level	All projects, regardless of hierarchical location
Inside a project	That project only
Inside a folder	All projects that are also in the same folder

Published Date: Oct 10, 2016

Aperture: Show all images or sort by rating

This article has been archived and is no longer updated by Apple.

If you want to quickly display images that are rated a certain number of stars or higher, just use the keyboard shortcuts below.

While shortcuts are the fastest way to do this, you should also note that it's the exact same effect as clicking the magnifying glass button to access the Filter HUD. So if you wanted to add additional criteria to the filter, you could simply click the magnifying glass to do so.

The shortcut for "show all images" has the same effect as manually clearing the settings in the Filter HUD.

The filter always applies to the group of images that you currently have in your browser, which is determined by your selection in the project list. To apply a filter to all images in your Library, you would select the Library; to apply the filter to images in a project, select the project, and so forth.

Tip: Filters treat stacks based on the pick only. If your pick is a 4★, but you also have a 5★ in the stack, the entire stack will be missing when filtering for 5★.

Note: Page 115 in the Aperture Getting Started guide contains a copy of this list with incorrect "Show all" and "Show unrated" shortcuts. The shortcuts below are correct.

Function	Keyboard shortcut
Show unrated images or better	Control-` (accent grave, same key as tilde)
Show images rated 1★ or better	Control-1
Show images rated 2★ or better	Control-2
Show images rated 3★ or better	Control-3
Show images rated 4★ or better	Control-4
Show images rated 5★	Control-5
Show all images	Control-6
Show unrated images only	Control-7
Show rejects only	Control-8

Aperture: Images preview correctly in books but do not print as expected

This article has been archived and is no longer updated by Apple.

You may come across a situation in which an image previews correctly in an Aperture book, but when printed, the image is blank or appears distorted. This happens if the image has an unsupported bit depth or color mode (for example, a 32-bit CMYK image).

Aperture supports RGB images at depths of 8 or 16 bits per channel.

Published Date: Oct 10, 2016

Aperture: Redeye, Spot & Patch selections appear in wrong place when viewing multiple images

This article has been archived and is no longer updated by Apple.

If you're viewing an image in Aperture that has Redeye or Spot & Patch adjustments and then Command-click another image to get a multi-image view, the selection circles in the first image may appear to be in the wrong place.

This happens because the second image becomes the primary image when you Command-click it to enter multi-image view. The selection circles will only appear correctly on the primary image, therefore you shouldn't adjust the Redeye or Spot & Patch settings for non-primary images that appear in the Viewer.

This issue is resolved in Aperture 3.

Published Date: Oct 10, 2016

Aperture: Printing from full screen mode does not work as expected

This article has been archived and is no longer updated by Apple.

In Aperture, if you try to print an image from full screen mode, you may experience these issues:

- When you click the Preview button in the Print dialog, the Preview application opens, but the preview doesn't actually appear.
- Other options available from the Print dialog don't appear when you select them.

As a workaround, exit full screen mode before printing.

Tip: You can use the F key on your keyboard to toggle between full screen and windowed modes.

This document will be updated as more information becomes available.

Published Date: Oct 10, 2016

Aperture displays "Images Can‘t be Located" when sending files to an external editor

This article has been archived and is no longer updated by Apple.

If you select several images in Aperture and send them all to an external editor simultaneously, you might get an alert message that says some of the images could not be located. This can happen if you've selected several larger images and Aperture hasn't finished loading them all.

When you send a file to an external editor, Aperture must first create an intermediary file—a TIFF or PSD file, as determined by your preferences. If you select several large images at once, it can cause a brief caching delay—you'll see a "Loading Image..." message near the top of the Viewer when this occurs. If you try to send the files to an external editor before the images are done loading, Aperture won't be able to create the intermediary files and thus, the images can't be found.

To avoid this issue, wait until Aperture finishes loading all images (when the "Loading Image..." message has disappeared), then send your images to the external editor.

Note: Because Aperture has a limit on how much image data can be simultaneously cached, you may still get the message after all images have loaded. In this case, send fewer images at a time. Aperture does not have a set limit to the number of images that can be cached due to variations in image size and dependency on your computer's specific configuration.

Published Date: Oct 10, 2016

iPhoto names may override names assigned in the Import dialog in Aperture

This article has been archived and is no longer updated by Apple.

iPhoto features an "i" button that opens a panel in which you can edit file information such as the title and comments. When you import images from your iPhoto Library into Aperture, any titles that you attempt to set in the Import dialog may be overridden by titles that you manually edited in iPhoto.

This issue is resolved in Aperture 1.5.

As a workaround, you can correct the names of your imported images in the Metadata Inspector. If you have many affected files, you can use the Batch Change feature in the Metadata Inspector to restore the original file names.

1. Create a new project.
2. Drag the affected files into the new project.
3. Choose **Edit > Select All** (or press Command-A).
4. If the Inspectors are not already open, press "I" on your keyboard.
5. In the Metadata Inspector, choose **Batch Change** from the actions menu (the small gear icon in the top right corner).
6. In the Batch Change dialog, locate the Version Name Format pop-up menu, and choose **Edit**.
7. Here you can choose the format you want, but to simply restore the original file name, select Master File Name, and deselect any other elements that might be selected.
8. Click OK.
9. Click OK again.
10. Drag the files back to the project they belong to.

Published Date: Oct 10, 2016

Aperture: Images are cut off or missing when printing a Mini Size Book

This article has been archived and is no longer updated by Apple.

When you open the Print dialog in Aperture, you'll see a preset named Mini Size Book. Please note that you should only select this option if you're working with a Mini Book template. This preset does not scale down a full-size book layout, but rather sets up your printer for the paper size needed to print a Mini Size Book layout.

If you select this preset in the Print dialog while working with a full-size book, your images will appear cut off or they may not appear at all. Before you print a book, make sure that you select the print preset that corresponds with the size of the book you've laid out.

Published Date: Oct 10, 2016

Aperture: Tools can‘t always be selected

This article has been archived and is no longer updated by Apple.

If you try to select a tool from the toolbar while working with a book, web journal, web gallery, or light table, Aperture will sound a system beep, and the tool won't be selected.

This happens because adjustment tools are not available when working with these types of albums. You can access the tools by clicking the "Show viewer for this Browser" button to toggle between the viewer and the layout, thus editing the image without having to leave the album in the project list.

1. In the browser, select the thumbnail for the image you wish to adjust.
2. Click the "Show Viewer for this Browser" button near the top-left of the Browser.

Your selected image replaces the page (or light table) in the Viewer.

This issue is resolved in Aperture 3

Aperture: Slow performance when adjusting images in a book

This article has been archived and is no longer updated by Apple.

When you adjust images in a book in Aperture, the controls may respond slowly, making the images difficult to edit.

As a workaround, edit images in the Viewer, where the controls will respond much more quickly. To do this:

1. In the album, select the thumbnail for the image you wish to adjust.
2. Click the "Show Viewer for this Browser" button near the top-left of the Browser.

Your selected image replaces the album page in the Viewer.

3. Press F to enter full screen mode, then make your adjustments.

Mac OS X does not rotate display image during installation

This article has been archived and is no longer updated by Apple.

If you use the display rotation function in Mac OS X with your Power Mac G5 (Late 2005), you may notice if you reinstall Mac OS X that the installation screens are not rotated and you may see some distorted video.

If you see this, be assured that it will be resolved once the installation is complete and you have restarted the computer. If you don't want to tilt your head during the installation, rotate your display back to its standard orientation temporarily—you can rotate it back after finishing the install.

Can‘t wake Power Mac G5 (Late 2005) with Apple Remote Desktop 2.2

This article has been archived and is no longer updated by Apple.

When you use Apple Remote Desktop 2.2 to try to wake a Power Mac G5 (Late 2005), Apple Remote Desktop may display a "communications error" message. This happens when you try to wake the Power Mac using its second Ethernet port.

To allow Apple Remote Desktop to give your Power Mac G5 (Late 2005) a wake up call, be sure to use the computer's primary Ethernet port.

Final Cut Pro 4.5 HD and earlier not supported on Power Mac G5 (Late 2005) or iMac G5 (iSight)

This article has been archived and is no longer updated by Apple.

Final Cut Pro 4 through Final Cut Pro HD 4.5 require a computer with an AGP video card for installation. PowerMac G5 (Late 2005) models (released October 19, 2005) and iMac G5 (iSight) models feature newer PCI Express video cards. Because of this, you can't install Final Cut Pro 4.x on these computers. Final Cut Pro 4.x is not supported on these computers.

Final Cut Pro 3.x and earlier do not work in Max OS X 10.4 Tiger. Because Power Mac G5 (Late 2005) and iMac G5 (iSight) models require Mac OS X 10.4.2 or later, you can't install Final Cut Pro 3.x or earlier versions on these computers. Final Cut Pro 3.x and earlier versions are not supported on any computer running Mac OS X 10.4.

To use Final Cut Pro on Power Mac G5 (Late 2005) or iMac G5 (iSight) computers, please upgrade to Final Cut Studio.

- Find more information about Final Cut Studio.

Mac OS X 10.4: Rotated images do not appear rotated in some applications

This article has been archived and is no longer updated by Apple.

Have you ever rotated (turned) a picture from your digital camera, or any other image, in an application in Mac OS X 10.4, only to find the rotation does not remain when you open it in a different application or on a different computer? We'll explain why that might happen.

Mac OS X 10.4 Tiger supports image rotation according to EXIFstandards. Earlier Mac OS versions did not support the EXIF standard.

This means that, in earlier versions, saving an image after rotating changed the actual pixels of the image file. However, this was often not desirable because rewriting the image file itself in the new orientation could degrade image quality (especially with lossy graphic formats such as JPEG). With EXIF-compatible applications, if you rotate an image, the file doesn't need to be rewritten.

Non-EXIF compatible applications display the image as it was originally created. EXIF-compatible applications use an Orientation tag to determine whether the image needs to be rotated before it is displayed. The image is rotated and displayed in RAM rather than in the file itself, so no change to the original file data is made.

If you want the image to appear rotated regardless of which application opens it, you'll need to open it in an application designed to save images for non-EXIF applications, rotate it, and save the image (with possible image quality loss).

Final Cut Pro supports up to two displays at a time

This article has been archived and is no longer updated by Apple.

Final Cut Pro allows you to use the application across two connected displays. While Mac OS X supports numerous displays, Final Cut Pro cannot display its windows on more than two computer displays at a time. This includes Digital Cinema Desktop mode.

For example, if you're using two displays for the interface windows, you will not be able to use a third display for Digital Cinema Desktop. You can set up a better, similar configuration by using your two displays for Final Cut Pro interface windows, but use a broadcast monitor for your main video display.

For more information on configuring Final Cut Pro with your hardware, refer to the Final Cut Pro User Manual, available from the Help menu in Final Cut Pro.

Mac OS X Server 10.4: Using the "DHCP and Netboot Server" option in the Firewall pane of Server Admin

This article has been archived and is no longer updated by Apple.

The Firewall pane in Server Admin includes an option for "DHCP and Netboot Server," which opens UDP port 67 for packets originating in the specified IP address group (typically a local subnet). However, this may not be adequate for actual DHCP clients.

If your clients are not getting DHCP leases, use the Advanced pane of the Firewall preference to add a rule similar to this one:

```
allow udp from any 68 to 255.255.255.255 dst-port 67 via en1
```

You may need to edit `via en1` to specify the network interface corresponding to your local network with the DHCP clients. To specify `via en1` in the Advanced pane, choose **Other...** from the **Interface** pop-up menu, and type `via en1` (or whatever is appropriate for your configuration) in the text field.

Background information

During the initial stages of a DHCP packet exchange, the prospective DHCP clients don't yet have an address on the subnet. Such clients send two UDP broadcast packets (DHCP DISCOVER and REQUEST) from source address 0.0.0.0 to destination 255.255.255.255. However, the "allow" rule for packets from the specific local subnet will fail to match those packets, and they will be blocked by the catch-all rule that denies all packets.

This issue does not affect DHCP servers and firewalls configured using the Gateway Setup application, because it automatically adds a rule similar to the one mentioned above. Nor does this issue affect Mac OS X Server 10.3 to 10.3.9, because Panther Server, by default, does not contain the catch-all rule that denies all packets including UDP packets.

Mac OS X Server 10.4 or later: Removing old updates from Software Update Server

This article has been archived and is no longer updated by Apple.

To remove old software updates from your Software Update Server, follow the steps below.

1. On the local Software Update server, open a Terminal window and type the following command:

   ```
   grep swupd /etc/swupd/com.apple.server.swupdate.plist > ~/Desktop/update_list.txt
   ```

2. Look on your desktop, and you'll see that the last command created the file "update_list.txt," which is a complete list of all the software updates stored on your server. Because the list is excerpted from a preference file, each individual entry will look something like this:

   ```
   <string>/usr/share/swupd/html/061-2036/.../SecUpd2005-007Ri.tar</string>
   ```

   This entry is for Security Update 2005-007, as you can see at the end of the string. The rest of the string is the update's full pathname on your server. Each update resides in its own folder, which is `061-2036` in this example.
3. To remove a given update from the server, simply delete the similarly-named folder for the targeted update. Take a look at the entry for the Safari 2.0.1 Update:

   ```
   <string>/usr/share/swupd/html/061-2048/.../SafariUpdate-2.0.1.tar</string>
   ```

   To remove the Safari 2.0.1 Update from the server, you would type this command in Terminal, entering your administrator password when prompted:

   ```
   sudo rm -rf /usr/share/swupd/html/061-2048/
   ```

By following this example, you can delete any software update in the list. When you're finished deleting files, you should drag update_list.txt to the Trash to ensure that you work from a fresh list next time.

Mac OS X Server 10.4 or later requires pre-authentication for Kerberos clients

This article has been archived and is no longer updated by Apple.

For increased security, Kerberos clients of Mac OS X 10.4 or later must pre-authenticate before regular Kerberos authentication. Pre-authentication occurs automatically without user interaction.

Third-party products integrated with an environment in which Mac OS X Server handles Kerberos authentication (KDC) must support Kerberos pre-authentication.

Authentication will fail if the third-party product can't support pre-authentication or is configured not to do so. Check the third-party documentation to see if the product is configurable for pre-authentication, and change the configuration if necessary.

Front Row: DVD Player alert message the first time a DVD is played

This article has been archived and is no longer updated by Apple.

With the iMac G5 (iSight) and Front Row, you can use your iMac's remote control and Front Row to play a DVD movie disc in your optical drive. When you do this, the movie is actually played using DVD Player instead of Front Row. You can change DVD Player's region code up to five times.

If you haven't set a region code in DVD Player (usually done the first time you try to play a DVD movie), you will see an error message the first time you try to play a DVD movie via Front Row.

If the first DVD you try to play has more than one region code available, DVD Player will prompt you to choose the region code for your optical drive. This can also happen if you are not logged in as an admin user the first time you play a DVD.

If this occurs while the Front Row interface is active, you will see this alert message:

> "An error was encountered while communicating with DVD Player. Press the Play/Pause button to go to the desktop."

When you return to the desktop, you will see the Region Setting dialog in DVD Player. Choose the region setting for your drive.

Note: Administrative users aren't prompted to change the region the very first time a single-region DVD movie disc is inserted. Instead, the region of the optical drive is automatically set to the region of the DVD disc that was inserted.

Xsan 1.2: Modify the JournalSize parameter on upgraded Xsan installations for improved performance

This article has been archived and is no longer updated by Apple.

In Xsan 1.2, the default value for a volume's JournalSize parameter has been increased from 4 MB to 16 MB. Increasing this value improves the performance on installations with intensive metadata loads, such as for home directory usage and general purpose file servers.

Because the new default value is written to a volume's config file at the time of creation, you must manually edit the config file for existing Xsan installations that you've upgraded to version 1.2 to get the performance benefit.

To change the JournalSize value for a volume:

1. Using Xsan Admin, stop the volume that you want to modify.
   Note: You don't need to unmount the clients.

2. Open the file `/Library/Filesystems/Xsan/config/volumename.cfg` in the editor of your choice.

3. Locate the JournalSize parameter, and change the value from `4M` to `16M`.
   Note: If you have more than one metadata controller (MDC), make sure to modify the volume config file on all of them.

4. On an MDC, execute this command:

   ```
   sudo cvupdatefs volumename
   ```

   Note: If you have more than one MDC, you don't need to run this command on each of them—just on one.

5. Using Xsan Admin, start the volume.

Clients should be able to access the volume as before.

Mac OS X Server: Older Open Directory backups can‘t be used when migrating to version 10.4

This article has been archived and is no longer updated by Apple.

The Mac OS X Server Open Directory Administration Guide for Version 10.3 and Later provides instructions for backing up and restoring Open Directory files. Do not use this guide when migrating to Mac OS X Server version 10.4.

The reason is that the LDAP schemas are different in 10.3 and 10.4, so you can't use 10.3 backups to restore 10.4.

Instead, you should follow the instructions found in Mac OS X Server Upgrading and Migrating For Version 10.4 or Later to recreate Open Directory data when migrating from version 10.3 to version 10.4.

Published Date: Oct 10, 2016

Color values may appear to change in a Mac OS X Colors window

This article has been archived and is no longer updated by Apple.

When using a Colors window in applications such as Keynote, Microsoft Word 2004, TextEdit, or others (for example, to change the color of text), you can optionally use Color Sliders to specify numerical values in Gray Scale, RGB, CMYK, or HSB colorspaces to achieve a desired color.

Usually, the values selected will change if a different color profile is selected in the color profile menu. (This menu is accessed by clicking the colored box icon just below the magnifying glass icon in the Colors window. The choices available in the color profile menu vary depending on which color slider choice is selected from the pop-up menu next to the colored box, such as "Gray Scale Sliders".)

The "Device RGB" color profile, visible in the color profile menu when the sliders pop-up menu is set to "RGB Sliders," represents the device that the color is being output to—typically a computer display. If color values are chosen in the "Generic RGB" profile for example, the values typically change when viewed in the "Device RGB" profile.

Why color values may appear to change

Since not all devices display color in the same way, a color profile defines how a particular device treats color, allowing Mac OS X and application programs to adjust color values to ensure the same actual color is output to all devices. The change in color values observed when switching color profiles is an indication that adjustments were necessary to preserve the perceived (actual) color value.

Note: When using the Magnifying Glass to select the color of a pixel on your screen, the "Device RGB" profile is used by default to determine the color values from the display.

QuickTime 7.0.3 for Windows: Download refreshed version for Java programs

This article has been archived and is no longer updated by Apple.

Since the release of QuickTime 7.0.3 for Windows, a newer QuickTime 7.0.3 for Windows has been released. In the original version, programs that were authored with QuickTime for Java might not work.

If you experience any issues with programs that use QuickTime for Java on Windows, download the new version of QuickTime 7.0.3 for Windows from here.

To determine which version of QuickTime 7.0.3 is installed on your computer:

1. Right-click on the QuickTime Player icon (located in C:\Program Files\QuickTime\)
2. On the shortcut menu, click **Properties** to open the QuickTime Player Properties window.
3. Click the Version tab to display File Version information.

The newer QuickTime 7.0.3 will appear as:

File Version: 7.0.3.50

The older version will appear as:

File Version: 7.0.3.25

Aperture: Import sessions can have the same number

This article has been archived and is no longer updated by Apple.

If you use the Import Session criterion in the Filter HUD, you might occasionally find two sessions with the same session number. This happens when two import sessions run concurrently. Note that the time stamp will still be unique for each, so you can still tell them apart.

This document will be updated as more information becomes available.

Published Date: Oct 10, 2016

Aperture: "Import Error" message during concurrent imports

This article has been archived and is no longer updated by Apple.

Aperture allows you to have multiple concurrent imports from the same device. However, if you try importing from multiple devices concurrently, you will get an "Import Error" dialog. Restrict your importing to one device at a time.

Published Date: Oct 10, 2016

Aperture: Keyword hierarchy in HUD unexpectedly changes

This article has been archived and is no longer updated by Apple.

Dragging keywords from the Keyword HUD to the Control Bar can result in inadvertent changes to the Keyword hierarchy in the HUD.

For example: You start to drag a key word from the Keyword HUD to the Control Bar, but you change your mind before dropping it onto the Control Bar. The keyword ends up in a different position within the HUD.

This happens if the mouse button is released while the keyword is over a new position. Aperture will interpret this as a request to reorder the keywords within the HUD. If you start to drag a keyword and then change your mind, always drag the keyword back to its original position.

In Aperture 1.5, you can prevent this from happening by clicking the lock icon at the lower left corner of the Keyword HUD.

Published Date: Feb 19, 2012

Aperture: "Inaccessible iPhoto Images" message when importing

This article has been archived and is no longer updated by Apple.

When importing an iPhoto Library, it's possible to get an alert message that says "Inaccessible iPhoto Images."

This happens if you import images from a folder that contains an albumdata.xml file, which normally resides in your iPhoto Library folder. Images normally do not reside in this folder, because iPhoto puts them in subfolders within the iPhoto Library. Thus this issue should only occur if you have either rearranged images manually or copied the albumdata.xml into a folder containing images.

You should not manually move, rename, or delete any images or files in your iPhoto Library folder.

Please update to the latest software version if you continue to experience this issue.

Choose **Apple > Software Update** to make sure you have the most recent upgrade.

This issue is resolved in Aperture 1.5.

Aperture: Images seem to disappear or go missing

This article has been archived and is no longer updated by Apple.

Are your images missing?

If you don't know about the rating or keyword filtering shortcuts in Aperture, you may unknowingly press one of the keyboard shortcuts that invokes a filter, and then wonder why some or all of your images have disappeared. Don't worry. They're not missing.

If you don't have any images tagged to a particular keyword, Aperture won't display any images when filtering for that keyword. The same is true for ratings.

Tip: Filters treat stacks based on the pick only. If your pick is a 4★, but you also have a 5★ in the stack, the entire stack will be missing when filtering for 5★.

If you're concerned about your "rejects" specifically, remember that the default filter of "unrated or better" hides your rejects, which are considered to be a lower rank than "unrated."

To see "unrated or better" images again, you can just click the "x" in the search field to clear it. To see all images, including rejects, simply press Control-` (accent grave, same key as tilde); or click the magnifying glass icon to access the Filter HUD, then deselect the keyword criterion.

Note: After you invoke a filter, it will persist until cleared, even after selecting a different project or quitting the application.

Xsan 1.2: How to use the Xsan 1.2 Updates

This article has been archived and is no longer updated by Apple.

This article outlines the basic steps required to update Xsan 1.1 to version 1.2. If you are still using Xsan 1.0, you must first update to Xsan 1.1. Please note that the Xsan Migration guide, available here, contains additional scenarios and details.

The steps vary according to whether your starting point is Mac OS X 10.3.9 or Mac OS X 10.4.3 or later, and there are two versions of the Xsan 1.2 Update to accommodate that.

Before you begin

- All metadata controllers (MDCs) should have the same version of Mac OS X.
- Do not make any changes to Xsan settings using Xsan Admin or the command-line tools during the installation.
- Be sure that all MDCs are updated before you make any configuration changes.
- If any system in your Xsan network is running Xsan 1.2 on Mac OS X 10.4.3 or later, then your MDCs must also be updated to Xsan 1.2 on Mac OS X 10.4.3 or later. The same is true for Xsan 1.2 on Mac OS X 10.3.9. The rule of thumb is that your MDCs must be running an Xsan version and operating system version that is as current as the most current of your clients.

Important: Preventing an inconsistent volume state

Xsan versions prior to 1.2 may have left bitmap artifacts on Xsan volumes, which could result in an inconsistent volume state. After all MDCs have been updated to Xsan 1.2, you should run the cvfsck command (as described below) to ensure a consistent volume state and to prevent data corruption or stability issues over the long term.

Updating Xsan 1.1 on Mac OS X 10.3.9 to Xsan 1.2

Follow these steps to update Mac OS X 10.3.9 from Xsan 1.1 to Xsan 1.2:

1. Unmount volumes on the controllers.
2. Update Xsan on one MDC at a time, using the Xsan 1.2 Update for 10.3.9.
3. Update any admin computers using the Xsan Admin 1.2 Update.
4. Stop the volume using Xsan Admin.
5. In Terminal on the MDC, run this command as root:

   ```
   # cvfsck volumeName
   ```

   Note: Replace "volumeName" with the actual name of an Xsan volume.

6. Restart the volume using Xsan Admin.
7. Repeat steps 4 to 6 until you have run cvfsck for each Xsan volume.
8. Update client Mac OS X 10.3.9 client computers using the Xsan 1.2 Update for 10.3.9.

Updating Xsan 1.1 on Mac OS X 10.4.3 or later to Xsan 1.2

1. Update Xsan on one MDC at a time, using the Xsan 1.2 Update for 10.4.3.
2. Update any admin computers using the Xsan Admin 1.2 Update.
3. Stop the volume using Xsan Admin.
4. In Terminal on the MDC, run this command as root:

   ```
   # cvfsck volumeName
   ```

   Note: Replace "volumeName" with the actual name of an Xsan volume.

5. Restart the volume using Xsan Admin.
6. Repeat steps 3 to 5 until you have run cvfsck for each Xsan volume.
7. Update Mac OS X 10.4.3 (or later) client computers using the Xsan 1.2 Update for 10.4.3.

Don‘t move a PowerBook G4 (Double-Layer SD) for a moment after putting it to sleep

This article has been archived and is no longer updated by Apple.

Don't move your PowerBook G4 (Double-Layer SD) once you've put it to sleep until you actually see its sleep indicator light pulsing. The pulsating light indicates that the computer has gone completely to sleep. When your computer reaches its sleep state, the hard drive is no longer writing information and thus it is safe to move the system without damage to the drive.

Aperture: Photos in "Picture" themed web gallery misaligned when viewed in IE 6 for Windows

This article has been archived and is no longer updated by Apple.

Web galleries created using the Picture theme may appear misaligned when viewed in Microsoft Internet Explorer 6 for Windows.

Normally the metadata should wrap from one line to the next below a thumbnail when using an extended metadata set, but in MS IE 6 it will appear as only one piece of metadata per line, resulting in a much taller vertical column of text. The text has the effect of pushing thumbs up the page and can thus cause the thumbs not to align with each other.

This document will be updated as more information becomes available.

Aperture: "Art Collection" web journal looks different than its preview picture in the themes list

This article has been archived and is no longer updated by Apple.

When you select the Art Collection web journal theme, it starts off looking different from its preview picture. The reason is that the preview image shows this theme with the "Header with Image" option selected, but it actually starts off with the "Header with Text" option selected. To get the desired look, choose the Header with Image option.

Aperture: Page turns white in Stock Black Book

This article has been archived and is no longer updated by Apple.

If you are working with a Stock Book Black in Edit Layout mode, it's possible to select the black background and delete it, leaving a white page behind (this won't happen when in Edit Content mode). If you do this accidentally, the quickest fix is to select **Edit > Undo** before going any further. If you're too far gone to use Undo, you have two different options for fixing it.

For any page other than the cover, you can select the page in the Pages pane, then click the black triangle next to it for the list of page templates. Choose any template that is **different** from the currently selected template, then switch back to the desired template. This will cause you to have to replace the art and/or text on this page, but it won't affect the rest of the book.

However, this method won't work if you've done this to the cover, because there is no alternate template for the cover. In this event, use method 2:

1. Make note of any unique text you've entered throughout the book, because you may lose some of it (particularly captions).
2. Click the Theme button (just above the Pages pane), immediately to the left of "Theme: Stock Book Black".
3. When you see the "Switching Themes" warning, click OK.
4. Select Stock Book from the list of themes, and click Choose Theme.
5. Repeat steps 3 and 4, except that this time you'll switch back to Stock Book Black.
6. Replace images and/or text on the page that was affected, and check all other pages for text (particularly captions) that may have been lost in the theme switch.

How to play streaming radio in Front Row

This article has been archived and is no longer updated by Apple.

You can play streaming radio stations in Front Row. You can't access the full list of stations that are available, but you can play stations that are saved in your iTunes library folder.

Here's how to save a favorite station to your iTunes library:

1. Open iTunes and click on Radio.
2. Toggle the disclosure triangles to see the streams available.
3. When you've found one you like, click on the stream you want and drag the selection into your Library folder in the Source pane of iTunes.

Now that you've saved the streaming radio station in your iTunes Music Library, you can select it in Front Row.

iTunes download button isn‘t visible on the Download webpage

This article has been archived and is no longer updated by Apple.

You may come across a situation when you try to download iTunes from the Download iTunes webpage, but the actual "Download iTunes" button is missing from the page.

This may be due to certain ad-blocking software; most commonly, McAfee Privacy Service. If you have this software installed on your computer and have it configured to block Internet ads, you may see this issue. (McAfee Privacy Service is commonly pre-installed on Windows-compatible computers, so it may have been installed at the factory for you.)

Logic Pro versions earlier than 7.2 are not compatible with Pro Tools 7

This article has been archived and is no longer updated by Apple.

Pro Tools version 7 contains significant changes to the Digidesign Audio Engine that make it incompatible with current versions of Logic Pro 7 using TDM. If you plan to use Logic Pro 7 with your TDM system, it is strongly recommended that you continue to use Pro Tools version 6.9.x.

To use Pro Tools 7 on the same system as Logic Pro, it would be necessary to create a separate startup partition, maintaining Pro Tools 6.9.x on one partition for use with Logic Pro, and installing Pro Tools 7 on the other.

This document will be updated as more information becomes available.

Logic Pro 7.2 is compatible with ProTools 7. See document 302969 for more information.

iTunes Store: Resolving difficulties with redeeming gifts

This article has been archived and is no longer updated by Apple.

If someone gave you an iTunes Store gift but you're having difficulty trying to redeem it in iTunes 6 or later, try these steps.

1. In your email application, find your music gift message.
2. Right-click (or Control-click) the Redeem image and from the shortcut menu, choose **Copy**.
3. Click in your web browser's address field and from the **Edit** menu, choose **Paste**. The web address should look similar to this:
   `https://phobos.apple.com/WebObjects/MZFinance.woa/wa/com.apple.jingle.app.finance.DirectAction/freeProductCodeWizard?code=RAAAAAAAAA3`
4. Press Return. iTunes should open and accept the gift (you may need to login to your account).

If the above steps did not work, then try these steps:

1. Locate your gift code. It appears after the "code=" text in the text you copied into the web address. In our example above, it would be `RAAAAAAAAA3`). Select and copy this code (you could also write it down).
2. Open iTunes, go to the iTunes Store, and sign in to your account.

3. In the QUICK LINKS section in the right column, click Redeem.

4. In the resulting screen, paste or type in your code, click Submit, and your music will begin to download.

About the security content of the Mac OS X 10.4.3 update

This article has been archived and is no longer updated by Apple.

This document describes the security content of Mac OS X 10.4.3, which can be downloaded and installed using Software Update, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How To Use The Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Mac OS X v10.4.3

- **Finder**

  CVE-ID: CVE-2005-2749

  Available for: Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: File ownership information may be misleading

  Description: Under certain situations, the file and group ownership information displayed in the Finder Get Info window may not be correct. This update addresses the issue by synchronizing the displayed ownership with the actual ownership in all situations. This issue does not affect systems prior to Mac OS X v10.4.

- **Software Update**

  CVE-ID: CVE-2005-2750

  Available for: Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: Important Software Updates may not install

  Description: Software Update can be instructed by the user to ignore specific updates. If all applicable updates have been marked in this way, Software Update will exit without providing an an opportunity to reset the status of these updates so that they may be installed. This update addresses the issue by asking whether the ignored updates list should be reset when this situation is encountered. This issue does not affect systems prior to Mac OS X v10.4.

- **memberd**

  CVE-ID: CVE-2005-2751

  Available for: Mac OS X Server v10.4.2

  Impact: Changes to group membership are delayed for hours

  Description: In certain situations, changes to a group's membership may not be immediately reflected in access control checks. This may result in an authenticated user being able to access files or other resources even after they have been removed from a group. This update addresses the issue by invalidating the group membership cache at appropriate times. This issue does not affect systems prior to Mac OS X v10.4.

- **Keychain**

  CVE-ID: CVE-2005-2739

  Available for: Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: Keychain Access will continue displaying plaintext passwords after lock timeout

  Description: Keychain Access is a utility distributed with Mac OS X that is used to view keychain items and change keychain settings. If a keychain automatically locks due to a timeout while viewing a password stored inside it, that password will remain visible. This update patches Keychain Access so that passwords are hidden when keychains lock. This issue does not affect systems prior to Mac OS X v10.4. Credit to Eric Hall of DarkArt Consulting Services for reporting this issue.

- **Kernel**

  CVE-ID: CVE-2005-1126, CVE-2005-1406, CVE-2005-2752

  Available for: Mac OS X v10.4.2, Mac OS X Server v10.4.2

  Impact: Kernel memory may be disclosed to local users

  Description: Certain kernel interfaces may return data that includes sensitive information in uninitialized memory. These issues affect Mac OS X v10.4.2 and earlier. Credit to Ilja van Sprundel and Neil Archibald of Suresec LTD and Colin Percival of the FreeBSD team for reporting these issues.

Mac OS X Server 10.4: System Image Utility won‘t include Xcode in customized image created from 10.4.3 DVD

This article has been archived and is no longer updated by Apple.

When creating a customized NetInstall image from the Mac OS 10.4.3 Installation DVD, you may notice that the Xcode package isn't selectable.

To work around this issue, create the disk image without the Xcode package, then follow these steps:

1. After creating the NetInstall image, open the resulting .nbi folder.
2. Double-click the Install.dmg file to mount the disk image.
3. Remove the contents of the Xcode Tools folder at the root level of the image.
4. Copy the XcodeTools.mpkg and Packages folder from the Installation DVD to the Xcode Tools folder.
5. Eject the the image.

About the security content of QuickTime 7.0.3

This article has been archived and is no longer updated by Apple.

This document describes the security content of QuickTime 7.0.3, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How To Use The Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

QuickTime 7.0.3

- **QuickTime**

  CVE-ID: CVE-2005-2753

  Available for: Mac OS X v10.3.9 or later, Microsoft Windows XP, Microsoft Windows 2000

  Impact: An integer overflow may be exploitable via remotely originated content

  Description: A sign extension of an embedded "Pascal" style string could result in a very large memory copy. The update treats the string as having unsigned length. Credit to Piotr Bania (bania.piotr@gmail.com) for reporting this issue.

- **QuickTime**

  CVE-ID: CVE-2005-2755

  Available for: Mac OS X v10.3.9 or later, Microsoft Windows XP, Microsoft Windows 2000

  Impact: A denial of service against any application loading remotely-originated content

  Description: A missing movie attribute is interpreted as an extension, but the absence of the extension is not flagged as an error, resulting in a de-reference of a NULL pointer. The update requires either the movie attribute or the extension to be present for a well-formed movie. Credit to Piotr Bania (bania.piotr@gmail.com) for reporting this issue.

- **QuickTime**

  CVE-ID: CVE-2005-2754

  Available for: Mac OS X v10.3.9 or later, Microsoft Windows XP, Microsoft Windows 2000

  Impact: An integer overflow may be exploitable via remotely originated content

  Description: Improper movie attributes could result in a very large memory copy. The update checks for a valid non-zero size before copying. Credit to Piotr Bania (bania.piotr@gmail.com) for reporting this issue.

- **QuickTime**

  CVE-ID: CVE-2005-2756

  Available for: Mac OS X v10.3.9 or later, Microsoft Windows XP, Microsoft Windows 2000

  Impact: Compressed PICT data may overwrite application memory from remotely originated content

  Description: Expansion of compressed PICT data could exceed the size of the destination buffer. The update prevents decompressed data from exceeding the destination buffer size. Credit to Piotr Bania (bania.piotr@gmail.com) for reporting this issue.

I don‘t see some of my songs when browsing by artist on my iPod

This article has been archived and is no longer updated by Apple.

If you're looking for a particular song on your iPod and browse by artist (select **Music > Artists**), you may notice that some songs that you know are on your iPod are missing. This can happen if a song file is missing the album name information from its ID3 tag. You will be able to find such songs in the Songs menu.

To assign an album name to a song file:

1. Open iTunes.
2. Select the song or songs that you want to edit.
3. From the **File** menu, choose **Get Info**.
4. Click the Info tab.
5. Type the album name in the Album field, make any other changes that you wish, and then click OK.
6. If you have iTunes set to update songs on your iPod automatically, choose **Update iPod** from the **File** menu. If you manually update your iPod, drag the song from your iTunes library to the iPod icon in the Source list.

If you have an iPod classic or iPod nano (3rd generation), click here for more information.

Power Mac G5 (Late 2005) displays "DCD Main" as the only option for Digital Cinema Desktop

This article has been archived and is no longer updated by Apple.

If you're using two displays with a Power Mac G5 (Late 2005), you may come across a situation in which the only Digital Cinema Desktop display mode available in the menu is DCD Main. This issue affects the following products:

- Power Mac G5 (Late 2005)
- Final Cut Pro 5
- Soundtrack Pro
- FinalCut Express HD 3
- Logic Pro 7

To resolve this issue, use Software Update to download and install Pro Application Update 2005-02.

Mac OS X 10.4: Can‘t save owner or permissions changes in the Finder

This article has been archived and is no longer updated by Apple.

If you're using a computer with Mac OS X 10.4 to 10.4.2 and change a file's ownership or permissions in an Info window (select a file and then choose **Get Info** from the **File** menu), the settings will appear to change, but they aren't actually applied and saved. If you close and reopen the Info window, you'll see that the settings have reverted back to what they were before you made your adjustments.

To resolve this issue, update to Mac OS X 10.4.3 or later.

Advanced Tip: If you're not ready to update to Mac OS X 10.4.3 or later and you're comfortable using Terminal, you can use the chown and chmod commands to make ownership and permission settings changes. For more information on changing ownership, groups, and permissions in Terminal, see the man (manual) pages for chown and chmod (type `man chown` or `man chmod` in Terminal).

Mac OS X 10.4: Classic - "Connection failed, the server may not exist or is not operational at this time" alert

This article has been archived and is no longer updated by Apple.

Because Mac OS X 10.4 Tiger doesn't work with AppleShare (AFP) over AppleTalk, if you start Classic and try to access an AppleShare-based server (or an alias to the server is accessed by you or by an application), you will see this alert:

> "Connection failed, the server may not exist or is not operational at this time. Check the server name or IP address and try again."

Classic applications that rely on any AppleShare-over-AppleTalk services may also fail.

Adjust the server to use TCP/IP instead of AppleTalk

A good workaround is to configure the server to use AFP over TCP/IP, if possible, instead of AppleTalk.

Tip: If the issue occurs again when you open an application with Classic (because it needs to access an AppleShare-based server), consider using a Mac OS X version of the application instead.

Try removing aliases

If the server can't be configured to use TCP/IP, you may be able to prevent Classic from attempting to connect to the server by removing aliases to that server or to files on that server. Look for aliases to the server in these locations, then remove them:

> **Tip**: If you don't know where your System Folder that's used by Classic is, open Classic preferences. You'll see your selected System Folder in the "Select a System Folder for Classic" box.

- Recent Servers folders, within the Apple Menu Items of the System Folder used by Classic
- Apple Menu Items folder within the System Folder used by Classic
- The Servers folder within the System Folder used by Classic
- The Startup Items folder within the System Folder used by Classic

If the issue persists, reinstall your Mac OS 9 System Folder and Classic

If the issue persists, and you can't locate any other server aliases or resolve the issue by changing the server to use TCP/IP, try these steps:

1. Back up any important files that are in the System Folder used by Classic (again, if you don't know where your System Folder that's used by Classic is, open Classic preferences. You'll see your selected System Folder in the "Select a System Folder for Classic" box). For example, you might have some preferences files in the Preferences folder or custom items in the Apple Menu Items folder that you want to retain.
2. Turn off Classic if it's running.
3. Reinstall Classic and the Mac OS 9 System Folder ("Mac OS 9 System Support").

   Important: You must install Classic on the same volume as Mac OS X 10.4 Tiger to avoid issues.

4. After installation, open Classic preferences and make sure the newly-installed System Folder is selected.
5. If the issue is resolved, restore any file you backed up in step 1. If the issue returns, remove the restored files one or a few at a time to isolate the cause.

This document will be updated as more information becomes available.

Final Cut Pro 5: Timecode accuracy when using the Import Panasonic P2 function

This article has been archived and is no longer updated by Apple.

If you acquire clips via the Import Panasonic P2 function in Final Cut Pro, the timecode on an acquired clip may not always match the timecode on the P2 card under some circumstances. This can happen when media is copied to a Panasonic AJ-SPD850 DVCPRO50 P2 deck using external timecode.

In most situations, when you record to a P2 card using a P2 camera or VTR, each segment of audio/video media and timecode is recorded on the card as an individual clip. But if media gets recorded from sources with existing timecode, the result on the P2 card may include timecode breaks, without the P2 recorder creating a new clip. In such cases a single clip on the P2 card may contain non-continuous timecode that otherwise would have been made into separate clips.

When Final Cut Pro imports clips from a P2 card, it expects each clip to have a single progression of continuous timecode. If Final Cut Pro attempts to acquire a P2 clip with timecode breaks, it is unable to assign the non-continuous timecode to a single clip. Attempting to acquire such a clip can result in inaccurate timecode values in the clips in your Browser.

To work around timecode breaks on a P2 card, try these suggestions:

- If you are recording media with known timecode breaks to a P2 device, simply stop and restart the recording process around the point where the break occurs. This will cause the P2 device to create a clip break and Final Cut Pro will treat the media as two clips and can correctly assign the timecode. Be certain to stop recording prior to the timecode break and begin recording again after the break.
- If the media has already been recorded to the P2 card with timecode breaks contained within a single clip, then try capturing the media over FireWire or with a third-party capture device using analog or SDI/AES inputs and serial device control. Using Capture Now will automatically detect breaks in timecode and separate the media into clips with the correct timecode. You could also log the individual timecode segments and batch capture. If you do Batch Capture, remember to leave several seconds of room for pre-roll operations. Even though there is no physical tape, the pre-roll operation will be completed prior to each capture.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Final Cut Pro: All text in a field is cleared instead of the portion desired

This article has been archived and is no longer updated by Apple.

When using the Log and Capture window, you might want to change just part of an item name you typed previously. For instance, you might want to log a series of similarly-named items, such as:

"Jenifer Speech Closeup - glasses"
"Jenifer Speech Closeup - smiling"
"Jenifer Speech Closeup - answering"
And so forth...

Normally, you could type the item name the first time, and subsequently edit just the ending to make the new item. But under some circumstances, all of the name text in the field may unexpectedly disappear when you try to delete just part of it, thus requiring that you retype the whole name from the beginning.

Note: This behavior is resolved in Final Cut Pro 5.0.3 with the Mac OS X 10.4.3 Update. Updates are available via Software Update and from Apple Downloads.

If you are unable to to update to Mac OS X 10.4.3, you can try one of these tips as a workaround:

- You can drag the Logging tab out of the Log and Capture window so that it becomes a free-floating window. The problem is less likely to happen when the windows are separated.
- This problem is more likely to occur when logging clips offline with no capture device connected. If you have your camera or deck handy, have it connected and powered on while you log.

GarageBand: Audio file added from the Finder plays back at wrong speed

This article has been archived and is no longer updated by Apple.

If you drag an uncompressed audio file from the Finder or from another application into the timeline of a GarageBand project, it might play back at the wrong speed.

This happens when you use audio files at sample rates other than 44.1 kHz. Files with higher sample rates, such as 48 kHz, will play back too slow. Files with lower sample rates will play back too fast. You should only use files with the supported sample rate in GarageBand projects.

Published Date: Feb 19, 2012

Final Cut Pro and Final Cut Express: File in use error when rendering

This article has been archived and is no longer updated by Apple.

Note: This can also affect Final Cut Express. The workaround remains the same.

Spotlight, introduced with Mac OS X 10.4 Tiger, allows you to quickly perform searches for your files, not only by their names, but also by content and context. To do this, Spotlight keeps track of all your files. Every time you add or change a file, Spotlight indexes details about that file's qualities so that you can search for it later. Spotlight does this indexing all the time, while you're using your computer.

Since Spotlight is part of Mac OS X, it's able to do its job in the background, while not slowing things down for you. For instance, Spotlight's indexing should not interfere with demanding multimedia applications like Final Cut Pro, thanks to Mac OS X's multitasking.

Under rare circumstances, Final Cut Pro will report an error like this one while rendering:

This can happen when Final Cut Pro is creating render files in a folder that Spotlight indexes. But there's no need to worry. Just Click OK, and you can proceed with rendering normally. This will not happen when capturing.

This can happen because of the way that Final Cut Pro caches data while rendering, not because of any issue with Spotlight.

To prevent this from happening, you can tell Spotlight not to index the Render Files folder in your Scratch Disk:

1. From the **Apple** menu, choose **System Preferences**.
2. From the **View** menu, choose **Spotlight**.
3. Click the Privacy tab to reveal the areas that Spotlight will not index.
4. In the Finder, open your "Final Cut Pro Documents" folder.
5. Drag the Render Files folder into Spotlight's list, as shown here:

You don't need to add the other Final Cut Pro folders. In fact, it can be very handy to have Spotlight keep track of your captured clips. This makes it a breeze to find clips from any project.

This document will be updated as more information becomes available.

Aperture: "Couldn‘t Create" Error when Importing Images

This article has been archived and is no longer updated by Apple.

If you try to import files for which you don't have adequate permissions, Aperture will give you this message:

> **Import Error**
>
> An error (Couldn't create) occurred while attempting to import:
>
> /Users/user_name/path_to_file
>
> This file was not imported.

The situation is not common, but it could happen when importing from a server on which you have permissions for the enclosing folder but not the files themselves, for example.

1. In the Finder, select the affected files using Shift-click or Command-click as needed.
2. Press Option-Command-I to get the Multiple Item Info window.
3. Click the disclosure triangle next to Ownership & Permissions.
4. If necessary, click the lock button to authenticate. If you don't have owner or administrator privileges for the enclosing folder, you will need the assistance of someone who does.
5. Change the permissions of the files so that you have read or read/write permissions.

About the WebObjects 5.3.1 Update

This article has been archived and is no longer updated by Apple.

This document contains an overview and download information for the WebObjects 5.3.1 Update. WebObjects 5.3.1 is primarily for developers who want to develop WebObjects applications with Mac OS X 10.4 using Xcode 2.3 and WebObjects 5.3.1 Developer Tools, which are bundled with the Xcode 2.3 tools release. WebObjects 5.3.1 is formally qualified and supported on the Java 1.4.2 platform.

The WebObjects Current Patch List contains information on all available patches and updates for all versions of WebObjects. Read this document if you're not sure which update you need on your system.

This update addresses the issues and adds support for the features listed below:

- Adds a modified Developer tools license that allows WebObjects applications developed with Xcode 2.3 to be deployed on any compatible platform
- Adds better SQL Generation in the EOModeler Plug-in design tool in Xcode
- Improved FetchSpecification building in the EOModeler Plugin design tool in Xcode
- Adds a "components and elements" window for improved workflow in WebObjects Builder
- Addresses incompatibilities with Xcode 2.3 Developer tools on Mac OS X 10.4
- Bug fixes

Starting with the WebObjects Server Admin plug-in for Mac OS X Server 10.4, the WebObjects StartupItems mechanism for auto starting WebObjects services has migrated to launchd-based services. The documentation for deploying WebObjects applications can be found at here, and this documentation has been updated to describe the features of Mac OS X Server 10.4

Important: There are two mutually exclusive updates for this platform. In order to install the WebObjects 5.3.1 developer tools, you will need to install the Xcode 2.3 developer tools with the optional WebObjects packages enabled. WebObjects deployment is distributed through Mac OS X Server 10.4 and is installed by default. In order to update WebObjects Deployment to WebObjects 5.3.1, you will need to either run the Software Update application or manually download them and install.

WebObjects 5.3.1 Developer for Mac OS X 10.4

System requirements

WebObjects 5.3.1 Developer requires:

- Mac OS X 10.4 or later
- Xcode 2.3 Developer tools
- Java 1.4.2 Update 2 or later

If you have not yet updated to the correct version of Mac OS X or Developer Tools, you must do so before installing WebObjects 5.3.1. Mac OS X 10.4 and the Xcode 2.2 Developer tools are available through Software Update and ADC downloads.

If you are creating a new Mac OS X WebObjects 5.3.1 development system, you should install the software in the following order:

1. Install Mac OS X 10.4.
2. Run the Xcode 2.3 installer.
3. Select the Custom Install option.
4. Enable the WebObjects install packages.

WebObjects 5.3.1 Deployment for Mac OS X 10.4 Server

This update is available through the Software Update feature of Mac OS X. If you use this method, only the proper update for the software which you have installed on your system is visible and available for download.

System requirements

WebObjects 5.3.1 Deployment requires:

- Mac OS X Server 10.4 or later
- Java 1.4.2 or later
- Installation of WebObjects 5.3 Server Manual Software Update

If you have not yet updated to the correct version of Mac OS X Server, you must do so before installing WebObjects 5.3.1.

If you are creating a new Mac OS X WebObjects 5.3.1 deployment system, you should install the software in the following order:

1. Mac OS X 10.4
2. WebObjects 5.3 Server Manual Software Update
3. WebObjects 5.3.1 Server Software Update

Note: The WebObjects Server 5.3 Update is available only from Apple Downloads.

Configuration tasks

To configure and start the WebObjects services:

1. Start the Server Admin application.
2. Select the WebObjects service.
3. Click the Settings tab.
4. Configure the wotaskd and monitoring services.
5. Click the Start button.

Important: You do not need to manually edit the apache.conf file with the line. We have already inserted it for you:

```
# Including WebObjects Configs
Include /System/Library/WebObjects/Adaptors/Apache/apache.conf
```

Issues Outstanding in WebObjects 5.3.1

4430398: TITLE: OpenBase JDBC and J2SE 5.0

ISSUE: If you have upgraded to Java 1.5 Update 4, database transactions with OpenBase fail with strange data mapping errors.

RESOLUTION: Download the latest the latest J2SE 5.0-compliant OpenBase JDBC driver at: http://www.openbase.com

Issues resolved in WebObjects 5.3.1

4443822: TITLE: EOModeler incompatible with J2SE 5.0

ISSUE: Older versions of the EOModeler application, bundled with WebObjects, are incompatible with J2SE 5.0 Release 4.

RESOLUTION: This issue has been resolved.

3120230: TITLE: WOEventDisplay page is not accessible

ISSUE: The WOEventDisplay page was not accessible.

RESOLUTION: This issue has been resolved.

4209546: TITLE: Potential NullPointerException in EOEditingContext

ISSUE: Fixed a potential error condition in EOEditingContext.

RESOLUTION: This issue has been resolved.

4240473: TITLE: EOUtilities.localInstanceOfObject() NullPointerException when passed null

ISSUE: EOUtilities.localInstanceOfObject() was not properly checking for null values.

RESOLUTION: This issue has been resolved.

4142548: TITLE: Cannot create relations across multiple EOModels using XCode's EOModeler Plug-in

ISSUE: Cannot create relations across multiple EOModels using XCode's EOModeler Plug-in

RESOLUTION: In most instances, we are able to make cross model relationships available.

4142566: TITLE: EOModeler Plugin does not preserve Allow Null Values when upgrading from WO 5.2

ISSUE: XCode's EOModeler Plug-in was not respecting null values

RESOLUTION: This issue has been resolved.

4143767: TITLE: XCode will not open .eomodeld file with charValue

ISSUE: XCode's EOModeler Plug-in was not respecting char external types

RESOLUTION: This issue has been resolved.

4144527: TITLE: Exception in plugin when opening models with 'requiresAllQualifierBindingVariables' key

ISSUE: XCode's EOModeler Plug-in was not respecting the requiresAllQualifierBindingVariables key in eomodels

RESOLUTION: This issue has been resolved.

4149671: TITLE: Can not open existing eomodels with new xcode 2.1 modeller plugin

ISSUE: XCode's EOModeler Plug-in was not handling certain instances of Single Table Inheritance in eomodels correctly

RESOLUTION: This issue has been resolved.

4159090: TITLE: EOModeler application will not generate java files

ISSUE: EOModeler application could not generate java files because templates files were not installed

RESOLUTION: This issue has been resolved.

4171161: TITLE: EOModeled data does not retain graph layout between openings

ISSUE: XCode's EOModeler Plug-in does not retain graph layout between openings

RESOLUTION: Please note that if you had created or modified an eomodel in the Xcode 2.1 EOModeler plugin some of the diagram state may be invalid and will require you to delete the layout and elements files in your .eomodeld bundle.

4171162: TITLE: Schema generation problems with EOModel and xCode 2.1

ISSUE: XCode's EOModeler Plug-in might generate an exception with certain eomodels

RESOLUTION: This issue has been resolved.

4108931: TITLE: EOModeler application quit causes Xcode 2 to hang

ISSUE: Under some circumstances, when quitting EOModeler, Xcode would hang.

RESOLUTION: This issue has been resolved.

4120429: TITLE: Problems creating WebObjects J2EE enabled Application

ISSUE: An error panel appears creating WebObjects J2EE enabled Application in Xcode

RESOLUTION: This issue has been resolved.

4215730: TITLE: WOComponent template generates HTML 3.2 DTD, not 4.0.1

ISSUE: One of the WOComponent file templates was not generating HTML 4.0.1

RESOLUTION: This issue has been resolved.

4218449: TITLE: Assistant window in Xcode has 'Project Builder' in text

ISSUE: There were some references to 'Project Builder' instead of 'Xcode' in the WebObjects Assistant

RESOLUTION: This issue has been resolved.

4262647: TITLE: Infinite loop in New WebObjects Application Project assistant path chooser field

ISSUE: The WOAssistant could over aggressively validating file paths

RESOLUTION: This issue has been resolved.

4140818: TITLE: WebObjects Builder closes documents without quitting on Quit Command

ISSUE: WebObjects Builder closes documents without quitting on Quit Command

RESOLUTION: This issue has been resolved.

4141630: TITLE: Version error in WebObjects Builder Application

ISSUE: WebObjects Builder reported it's version incorrectly in the About box

RESOLUTION: This issue has been resolved.

4142458: TITLE: WebObjects Builder mouse over a Dynamic Element changes selection from selected text

ISSUE: Selection tracking in WebObjects Builder was not working correctly

RESOLUTION: This issue has been resolved.

4142654: TITLE: Saving WO component generates an error and deletes the component

ISSUE: WebObjects Builder was not respecting encoding specified in the preferences and therefore failed to save component changes

RESOLUTION: This issue has been resolved.

4145480: TITLE: Missing table buttons in WebObjects Builder inspector panel

ISSUE: The table manipulations buttons did not appear in WebObjects Builder inspector

RESOLUTION: This issue has been resolved.

4145481: TITLE: Need configurable palette of WO element icons

ISSUE: A replacement for the one click workflow toolbar functionality in WebObjects Builder

RESOLUTION: There is now a 'Elements and Components' window.

4151714: TITLE: HTML blockquote in WebObjects Builder produces a misspelled tag

ISSUE: HTML blockquote in WebObjects Builder produces a misspelled tag

RESOLUTION: This issue has been resolved.

4161213: TITLE: WebObjects Builder 5.3 allows binding to invalid action

ISSUE: WebObjects Builder allowed for invalid binding actions in the inspector

RESOLUTION: This issue has been resolved.

4168235: TITLE: WebObjects Builder Floating Inspector does not float under WebObjects Builder

ISSUE: WebObjects Builder floating inspector did not always order front correctly.

RESOLUTION: This issue has been resolved.

4234707: TITLE: WebObjects Builder loses Font and Font Size Setting

ISSUE: WebObjects Builder loses Font and Font Size Setting

RESOLUTION: This issue has been resolved.

4188001: TITLE: Problems with the WOStatsPage HTML template

ISSUE: The WOStatsPage was not accessible

RESOLUTION: This issue has been resolved.

4237223: TITLE: Direct Action generate non-valid URL

ISSUE: URLs generated by DirectActions sometimes incorrectly converted &

RESOLUTION: This issue has been resolved.

4169582: TITLE: Iterator returned by NSArray.iterator() returns null values

ISSUE: Sometimes Iterator returned by NSArray.iterator() returns null values

RESOLUTION: This issue has been resolved.

4267639: TITLE: WebObjects war servlet fails to open eomodeld hidden in application jar on Java 1.4.2_09

ISSUE: WebObjects war servlet failed to find eomodeld files within the bundle on Java 1.4.2 Update 2

RESOLUTION: This issue has been resolved.

4144617: TITLE: WODeclarationFormatException from deleting EO in D2W app with Basic look

ISSUE: One of the Direct To Web components caused a WODeclarationFormatException

RESOLUTION: This issue has been resolved.

4149116: TITLE: DirectToWeb generation misses removebutton

ISSUE: One of the Direct To Web components caused a WODeclarationFormatException

RESOLUTION: This issue has been resolved.

4164111: TITLE: D2W WOLInspectPage.wo misspelled submitchanges tag in 'WebObjects' template

ISSUE: One of the Direct To Web components caused a WODeclarationFormatException

RESOLUTION: This issue has been resolved.

4232286: TITLE: DTW generation error in one of the components

ISSUE: One of the Direct To Web components caused a WODeclarationFormatException

RESOLUTION: This issue has been resolved.

4232286: TITLE: incorrectly quoted value in HTML code causes runtime error in D2W

ISSUE: One of the Direct To Web components caused a WODeclarationFormatException

RESOLUTION: This issue has been resolved.

Troubleshooting

1. My application is throwing the exception "com.webobjects.foundation.NSForwardException for java.lang.NoClassDefFoundError: javax/servlet/ServletContext".

For some reason, the necessary packages are not in your classpath. Debug your classpath to make sure the javax.servlet.* classes are there. If the classes are not found, the resolution is to download the servlet.jar and put it into /Library/Java/Extensions or in your classpath. The servlet.jar can be found with many open source distributions (such as tomcat).

2. How do I convert my legacy WebObjects application to build as a true war bundle?

1. In Xcode, configure your build settings to the following:

```
SERVLET_SINGLE_DIR_DEPLOY = NO
SERVLET_STUB_WAR = NO
```

```
SERVLET_TRUE_WAR = YES
SERVLET_DEPLOY_LICENSE = <your deployment license>
SERVLET_WEBAPPS_DIR = /Library/JBoss/3.2/deploy
```

2. Add the JavaWOJSPServlet.framework to your project.
3. You should also verify that all of your custom frameworks are being built as jar files and are installed or linked into /Library/WebObjects/lib.

3. Interface Builder and the WebObjects Assistant in Xcode is complaining about the Enterprise Objects palette not being installed.

The Enterprise Objects palette is not loaded by default in the Xcode 2.3 release and has been moved from an auto-loaded location in /Developer/Palettes to /Developer/Extras/Palettes. This mainly effects people building Java Client nib based applications.

To load the palette from the new location:

1. Launch Interface Builder.
2. Choose **Tools > Palettes > Palette Preferences**.
3. Delete the "Missing" Enterprise Objects palette reference.
4. Add a new reference to the Palette in: /Developer/Extras/Palettes

CRT Displays: Troubleshooting No Video, Shaky Image, Or No Color

The document describes troubleshooting steps for displays that exhibit no video, shaky or wavy images, incorrect color, specific color background, or Energy Saver control panel issues.
This article has been archived and is no longer updated by Apple.

Symptom

A display may exhibit symptoms such as no video, shaky or wavy images, incorrect color, specific color background, or Energy Saver control panel issues.

Products affected

- All standalone displays

Solution

- No video may be caused by a loose video card, loose video cable, bad RAM, corrupt Parameter RAM, Energy Saver setting, dead backup battery on the computer logic board, or display hardware issue.
- Check the video cable connections - Shut the system down and remove then reconnect all the display cables to verify they are tight. Check the cable for stress, crimping, or bending. If the cable was compressed, crimped, bent against a table, wall, or chair leg it may need to be replaced. Some video cables are integrated into the display and require a local Apple-authorized service provider to replace them. In some cases, the video cable cannot be replaced.
- Test the display on another computer - If the issue does not occur on the other computer the issue is with the first computer, computer's video card, or software.
- Radio interference can be difficult to locate. The best method is to test the display at a different building which uses a different power source. If the display is at a school or a building with a common power source, try another site. Shaking, waviness, or jittering can be caused by another nearby electrical device including a display, fan, transformer, or motor. Interference may be identified by rotating the display on its side or turning it to face a different direction. If the interference pattern changes or goes away, it may be an environmental interference issue.
- Test the display with the power cord plugged directly into the wall outlet and into the computer's power outlet if the computer has a power out port. If the display operates normally when the power cord is plugged into the wall outlet but fails when it is plugged into the computer outlet, the computer power supply is suspect and should be checked by a local Apple-authorized service provider.
- If the display needs to be repaired, contact an Apple-authorized service provider or Apple support to arrange service.

Mac OS X: Change language if you can‘t use a decimal point in a custom print size

This article has been archived and is no longer updated by Apple.

You can use a custom print size in any version of Mac OS X, but the custom size cannot include decimal points (such as 8.5) if you use one of these as your primary Mac OS X language:

- French
- Swedish
- Norwegian

If you need to use a custom print size that includes a decimal point, temporarily switch your primary Mac OS X language to something other than French, Swedish, or Norwegian, in International preferences. For example, change it to English, then set your custom print size with decimal point, then change the language back to your original selection.

This document will be updated as more information becomes available.

Final Cut Pro 5: Unable to send to a Soundtrack Pro Audio File Project

This article has been archived and is no longer updated by Apple.

If you control-click an audio track with a linked clip in Final Cut Pro 5 and choose **Send to > Soundtrack Pro Audio File Project**, you may not be able to select it if it is dimmed. This happens if you are working with linked clips from different media sources.

To send audio from a linked clip, both the audio and video have to be from the same media file. But even if the audio you wish to send is from the same media file as the video, there may be additional audio tracks from other media files linked to the clip. In this case, you can't send to a Soundtrack Pro Audio File Project.

You can work with audio from a linked clip by either unlinking the media in the clip before sending to Soundtrack Pro or by choosing **Send To > Soundtrack Pro Multitrack Project** instead of **Send to > Soundtrack Pro Audio File Project**.

Note: This can also occur if you link two mono clips to create a stereo clip.

Final Cut Pro: Use Millions color setting for screen display

This article has been archived and is no longer updated by Apple.

Final Cut Pro requires that your computer's display be set to Millions so that it can accurately represent video content. Additionally, elements of Final Cut Pro's interface require the Millions color setting to display correctly.

To set or verify your display's color setting:

1. Choose **Apple** > **System Preferences**.
2. Choose **View** > **Displays** to open display preferences.
3. From the **Colors** pop-up menu, choose **Millions**.

If you have more than one display connected, there will be a separate settings panel for each display. Verify that each is set to Millions of colors.

Without the color setting at Millions, unexpected results might be observed in the appearance of the Title Safe and Action Safe overlays in the Canvas.

Notes

1. Final Cut Pro does not support **Thousands** or **256 Colors** modes.
2. Final Cut Pro supports only up to two displays at a time

Logic Pro/Express 7: Imported MIDI files do not have tempo or time signature changes

This article has been archived and is no longer updated by Apple.

If you import standard MIDI files using the procedure from the reference manual, Logic will ignore any embedded tempo or time signature changes, in order to maintain the integrity of existing tempo / TS changes in the Song.

Instead, use **File > Open...** to open Standard MIDI files. This will preserve both tempo and time signature changes.

Power Macintosh G3: Connecting to 10Base-2 Network

This article describes how to attach 10Base-2 or 10Base-5 Ethernet cabling to an RJ-45 equipped Power Macintosh.
This article has been archived and is no longer updated by Apple.
The Power Macintosh G3 computers have an RJ-45 connector for 10Base-T unshielded twisted pair (UTP) Ethernet cabling.

Here three ways to connect a Power Macintosh G3 computer's 10Base-T Ethernet to an existing coaxial Ethernet network:

- Install a coax-equipped PCI Ethernet card (must have a BNC connector)
- Add a hub with a BNC coax expansion port.
- Use a Media Adapter Transceiver (BNC/RJ-45, or coax/UTP)

The first solution may be the least expensive solution, especially if only a single computer is involved. Some PCI cards are dual-media, featuring both 10Base-T and 10Base-2 (BNC) connectors. Dual-media cards are a good choice if your coax network cabling is migrating to 10Base-T cabling in the future.

The second solution can range in price from that of a card to a more expensive hub, and is especially good if multiple 10Base-T systems are to be connected to an existing 10Base-2 coaxial Ethernet network -- or growth is anticipated.

The third solution was once in widespread use. Media adapter transceivers have faded from popularity as Ethernet has standardized more on twisted pair media. These media adapters can join a single RJ-45 connection to coax, and can to join two entire networks or add a single node to an existing network.

About the Mac OS X 10.4.4 Update (Combo)

This article has been archived and is no longer updated by Apple.

The Mac OS X 10.4.4 Update (Combo) updates Mac OS X 10.4, 10.4.1, 10.4.2, or 10.4.3 to version 10.4.4. (**Note**: This document discusses the Mac OS X 10.4.4 client update, if you're looking for Mac OS X 10.4.4 Server Update information, see this article.)

Important: Please read before installing.

- You may experience unexpected results if you have third-party system software modifications installed, or if you've modified the operating system through other means. (This does not apply to normal application software installation.)
- The installation process should not be interrupted. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to update.
- If issues occur during installation—for example, Software Update quits unexpectedly—please see this article.

Installation

You have two ways to update to Mac OS X 10.4.4: Use Software Update or the standalone installer. You only need to use *one* of these methods to update your computer.

Automatic Software Update
Software Update, located in System Preferences, can automatically download and install the latest Apple software. (Software Update might have linked you to this article to learn more about the update.)

Software Update notes:

- The update's size may vary from computer to computer when installed using Software Update.
- Because some updates are prerequisites for others, you may need to run Software Update more than once to get all available updates.

Standalone installer
Two versions of the installer (Delta and Combo, described below) are available from Apple Downloads as standalone updates. After you download an update, you can use it to update your computer without being connected to the Internet.

- The Delta Update installer (described in this article) updates Mac OS X 10.4.3 to 10.4.4.
- The Combo Update installer (described here) updates Mac OS X 10.4, 10.4.1, 10.4.2, or 10.4.3 to 10.4.4.

The standalone installer, particularly the Combo Update described here, is useful if you have multiple computers to update and only want to download the update once.

Improvements

This update offers many improvements. For a list of some of them, see this article.

How to identify Power Mac G5 DIMM slots

This article has been archived and is no longer updated by Apple.

Depending upon where you look, you may see the Power Mac G5 DIMM slots labeled in different ways; refer to the chart below to help identify specifically which DIMMs are installed within which DIMM slots on the Power Mac G5 computer.

Notes on columns in table:

- "Slot pair" is the number often silkscreened onto the logic board, and refers to the DIMM slots that make up that pair.
- The "J" numbers listed in the table below refer to the slot number that's silkscreened on the logic board. This slot number is also referred to within Apple System Profiler and in Apple diagnostics software such as Apple Hardware Test.
- The DIMM number is shown in Apple System Profiler next to the "J" number for a given slot.

Power Mac G5, Single 1.6 GHz model
As viewed from top to bottom:

Slot Pair	"J" number	DIMM number
2	J14	3
1	J12	1
1	J11	0
2	J13	2

Aperture 1: Actions apply to all images in the Viewer

This article has been archived and is no longer updated by Apple.

When you have multiple images in the Viewer, the following will be true:

- Adjustments will be applied only to the **primary** image in the Viewer.
- Actions will be applied to **all** images in the Viewer.

Adjustments include anything that appears in the Adjustments Inspector, such as Straighten, Levels, Sharpen, and so forth. **Actions** include application of a rating or keyword, stamping of metadata, and similar.

When you want to isolate only the selected image in the Viewer for an action, use the Toggle Primary Only button in the Control bar (also available via the keyboard shortcut "S" and via **Edit > Primary Only**).

Which image is the "Primary?"
When multiple images are in the Viewer in Multi mode, each image will have a white outline, because each is part of the multi-image selection that placed them all in the Viewer. One of them will have a thicker white outline, signifying that is the primary.

Best Fit Gives Unpredictable Results When Printing Books, Light Tables, and Contact Sheets

This article has been archived and is no longer updated by Apple.

Sometimes the Best Fit orientation setting in the Print Dialog will result in undesirable crops for Books and Light Tables. For Contact Sheets, it may result in undesired rotation.

Best Fit is best suited to printing single images. When there are multiple images on a page, such as with Books or Light tables, it is usually best to select Portrait or Landscape as needed.

Published Date: Feb 20, 2012

Aperture: Setting paper size to borderless does not work for some printers

This article has been archived and is no longer updated by Apple.

When using certain printers, simply setting the paper size to a borderless selection is not adequate. You must perform an extra step after selecting the borderless paper size in the Print dialog:

1. Click the Print Settings button.
2. Verify that all the settings you desire are correct (paper type, print quality, and so forth).
3. Click Done to close the printer settings.
4. Save the preset.

Now the image should print as desired.

Aperture: Images in excess of 100,000 not displayed

This article has been archived and is no longer updated by Apple.

Aperture's Browser will only display 100,000 images at a time, so those of you preparing to edit the next Olympics will need to create individual projects for "Track" and "Field." And actually, to maintain performance, you should limit yourself to 10,000 images per project or less.

If you've already put yourself in this situation and can't see all the images in a project, there's several easy ways out. First you might try this:

1. Create a new project for each 10,000 images that you imported.
2. Put the Browser into List view (**View > List**, or click the button).
3. Using the pop-up menu in the Browser, sort by Image Date or File Name, whichever you prefer.
4. Select images you want to move to the alternate project, and drag them there.

If you want more control, another easy way to achieve this effect would be to use either the Filter HUD for Smart Albums to create logical groupings of less than 100,000 images, then break them into smaller groups from there.

Note: Each version counts against the limit. This means for example, that if you import 100,000 originals and create 1,000 additional versions from them (and delete none), then you are 1,000 images over the limit.

Note that Aperture 1.1 or later will proactively warn you of the 100,000 image limit, when you hit it, and advise you to create a Smart Album.

This issue is resolved in Aperture 3.

Aperture: Red Eye may look fixed, even thought it‘s really not

This article has been archived and is no longer updated by Apple.

An image may appear to be fixed by the red eye tool even though there's still some red visible under the loupe or in a print.

This can happen whenever your image is scaled to fit your screen or Viewer size (which is most of the time), as opposed to being zoomed to 100 percent. Image scaling can obscure some smaller details.

Therefore you should check your work by using the loupe or toggling to 100 percent (Z key) before concluding that it's fixed.

Tip: This is also a good idea for checking noise reduction, spot & patch, and sharpening adjustments.

About the Mac OS X Server 10.4.4 Update (Combo)

This article has been archived and is no longer updated by Apple.

This software updates Mac OS X Server versions 10.4, 10.4.1, 10.4.2, and 10.4.3 to Mac OS X Server 10.4.4. It is a "combo" update that combines enhancements delivered with versions 10.4.1 through 10.4.4. If you already have Mac OS X Server 10.4.3, you can download a smaller update to update to version 10.4.4.

Important: Please Read Before Installing

- You must have an administrator account password that does not contain spaces or Option-keyed characters to install this update. The password may not be left blank (you can change your password if needed).
- You may experience unexpected results if you've installed third-party system software modifications, or if you have modified the operating system through other means. This doesn't apply to normal software installation.
- The installation process should not be interrupted. Monitor progress by clicking the Detailed Progress disclosure triangle. If a power outage or other interruption occurs during installation, use the standalone installer (see below) from Apple Downloads to install.
- This update can be installed on non-startup volumes, but you should only do this if the current startup volume has already been updated to Mac OS X Server 10.4.4. The simplest way to avoid issues from an improper installation is to start up from the volume that you wish to update.

Installation

There are two ways to update to Mac OS X Server 10.4.4: Use Software Update or install from the standalone installer.

Software Update Installation

Software Update may have referred you to this document. For more information on this feature, see "How to Update Your Software."

Because some updates are prerequisites for others, you may need to use Software Update more than once to get all available updates.

Note: This version of Mac OS X Server is built as a multi-package and should not be used with Software Update's "Download Only" and "Install and Keep Package" options. If you need to save these packages for later use, try the manual update instead.

Standalone Installer

A standalone installer is also available from Apple Downloads.

Remote Installation

If you need to install the update on a remote computer, you can do so using the "softwareupdate" command-line tool.

Enhancements delivered with this update

This update delivers many enhancements. Because this is a combo update, it includes enhancements that are delivered with the 10.4.1, 10.4.2, 10.4.3, and 10.4.4 updates. You can see the individual enhancement lists for 10.4.1, 10.4.2, 10.4.3, and 10.4.4 updates.

Published Date: Oct 10, 2016

Aperture: Sharpness not apparent at less than 100 percent

This article has been archived and is no longer updated by Apple.

When you view an image at less than 100 percent size, Aperture smooths it (a technique known as anti-aliasing) to get rid of artifacts that result from scaling down the photo. The relationship between anti-aliasing and sharpening is a trade-off; although anti-aliasing does not modify the actual image file, it does counter the effect of sharpening when viewing a scaled-down image.

Therefore, you should use the loupe or the zoom toggle (Z key) to evaluate your image for sharpness, and to check your work after using the sharpening tool.

Other applications, such as Adobe Photoshop, handle anti-aliasing differently, so the degree of apparent sharpness can vary from one application to the next when viewing an image at a scaled-down size. However, you should see consistency when comparing the image at 100 percent across other applications.

Note: Masters may appear sharper than versions at scaled-down sizes. Learn more here.

Compressor 1.X not compatible with Power Mac G5 (Late 2005) or iMac G5 (iSight)

This article has been archived and is no longer updated by Apple.

Compressor 1.x is not compatible with the Power Mac G5 (Late 2005) or iMac G5 (iSight).

Compressor 1.x requires a computer with an AGP video card. PowerMac G5 (Late 2005) models (released October 19, 2005) and iMac G5 (iSight) models feature newer PCI Express video cards. Because of this, Compressor 1.x is not compatible with these computers.

To use Compressor on Power Mac G5 (Late 2005) or iMac G5 (iSight) computers, please upgrade to Compressor 2. Compressor 2 is included with Final Cut Studio.

Compressor 1.x was included with Final Cut Pro 4, DVD Studio Pro 2 and 3, and Motion 1.

Find more information about Final Cut Studio:
http://www.apple.com/finalcutstudio/

Mac OS X: FTP connections may fail due to firewall on the server

This article has been archived and is no longer updated by Apple.

If you try to establish an FTP connection to a Mac OS X Server or other server that is running both FTP service and a firewall, the attempt may fail due to firewall protections.

When this happens, use SFTP instead. SFTP establishes the connection over SSH, so it's a secure connection. In contrast, regular FTP sends your password over plain text and is not secured.

Another workaround is to disable the firewall on the FTP server you are trying to connect to.

TextEdit: Custom page sizes do not change page margins

This article has been archived and is no longer updated by Apple.

While using TextEdit in any version of Mac OS X, you can customize your page margins within the document.

However, if you use the Page Setup dialog sheet to change to a custom page size that has different margins or to define (via the Manage Custom Sizes choice in the Paper Size pop-up menu) a custom page size, the document will not appear to use the custom size's margins.

To make sure your document will look the way you expect when it prints, preview it before printing.

This document will be updated as more information becomes available.

Aperture: Crop and Straighten adjustments behave unpredictably in the light table

This article has been archived and is no longer updated by Apple.

Crop and Straighten will not be available for images on the light table, except for those images to which Crop and Straighten were applied prior to being added to the light table. If you use the Crop and Straightened controls for these images on the light table, the results may be unexpected. Thus you should perform copping and straightening before adding images to a light table.

Xsan 1.1 or later: Tips for using snfsdefrag

This article has been archived and is no longer updated by Apple.

You can use the `snfsdefrag` command to defragment a file by reallocating its data in a single extent. If the `snfsdefrag` command fails on a client or controller running Xsan on Panther or Tiger, restart the computer. After restart, `snfsdefrag` should succeed, but if it doesn't, try stopping and restarting the volume using Xsan Admin.

Here is an example of a failed `snfsdefrag` command when run in verbose mode:

```
ServerName:/Volumes/MyVolumeName root# snfsdefrag -v
Tiger_8A428_ServerDVD_0Z693-5618-185.dmg
Tiger_8A428_ServerDVD_0Z693-5618-185.dmg: 4 extents: new extent count 1,
CvApi_SwapExtents failed for cookie 0x12b29133, skipping.
1 file visited: 0 defragged, 1 skipped
```

Here is an example of a successful snfsdefrag command when run in verbose mode:

```
ServerName:/Volumes/MyVolumeName root# snfsdefrag -v
Tiger_8A428_ServerDVD_0Z693-5618-185.dmg
Tiger_8A428_ServerDVD_0Z693-5618-185.dmg: 4 extents: new extent count 1, done.
1 file visited: 1 defragged, 0 skipped
```

For more information on snfsdefrag and other commands, see the Xsan Administrator's Guide.

About Security Update 2005-009

This article has been archived and is no longer updated by Apple.

This document describes Security Update 2005-009, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

Security Update 2005-009

- **Apache2**

  CVE-ID: CVE-2005-2088

  Available for: Mac OS X Server v10.3.9, Mac OS X Server v10.4.3

  Impact: Cross-site scripting may be possible in certain configurations

  Description: The Apache 2 web server may allow an attacker to bypass protections using specially-crafted HTTP headers. This behavior is only present when Apache is used in conjunction with certain proxy servers, caching servers, or web application firewalls. This update addresses the issue by incorporating Apache version 2.0.55.

- **apache_mod_ssl**

  CVE-ID: CVE-2005-2700

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS Xv10.4.3, Mac OS X Server v10.4.3

  Impact: SSL client authentication may be bypassed in certain configurations

  Description: The Apache web server's mod_ssl module may allow an attacker unauthorized access to a resource that is configured to require SSL client authentication. Only Apache configurations that include the "SSLVerifyClient require" directive may be affected. This update addresses the issue by incorporating mod_ssl 2.8.24 and Apache version 2.0.55 (Mac OS X Server).

- **CoreFoundation**

  CVE-ID: CVE-2005-2757

  Available for: Mac OS X v10.4.3, Mac OS X Server v10.4.3

  Impact: Resolving a maliciously-crafted URL may result in crashes or arbitrary code execution

  Description: By carefully crafting a URL, an attacker can trigger a heap buffer overflow in CoreFoundation which may result in a crash or arbitrary code execution. CoreFoundation is used by Safari and other applications. This update addresses the issue by performing additional validation of URLs. This issue does not affect systems prior to Mac OS X v10.4.

- **curl**

  CVE-ID: CVE-2005-3185

  Available for: Mac OS X v10.4.3, Mac OS X Server v10.4.3

  Impact: Visiting a malicious HTTP server and using NTLM authentication may result in arbitrary code execution

  Description: Using curl with NTLM authentication enabled to download an HTTP resource may allow an attacker to supply an overlong user or domain name. This may cause a stack buffer overflow and lead to arbitrary code execution. This update addresses the issue by performing additional validation when using NTLM authentication. This issue does not affect systems prior to Mac OS X v10.4.

- **iodbcadmintool**

  CVE-ID: CVE-2005-3700

Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.3, Mac OS X Server v10.4.3

Impact: Local users may gain elevated privileges

Description: The ODBC Administrator utility includes a helper tool called iodbcadmintool that executes with raised privileges. This helper tool contains a vulnerability that may allow local users to execute arbitrary commands with raised privileges. This update addresses the issue by providing an updated iodbcadmintool that is not susceptible.

- **OpenSSL**

  CVE-ID: CVE-2005-2969

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS Xv10.4.3, Mac OS X Server v10.4.3

  Impact: Applications using OpenSSL may be forced to use the weaker SSLv2 protocol

  Description: Applications that do not disable SSLv2 or that enable certain compatibility options when using OpenSSL may be vulnerable to a protocol downgrade attack. Such attacks may cause an SSL connection to use the SSLv2 protocol which provides less protection than SSLv3 or TLS. Further information on this issue is available at http://www.openssl.org/news/secadv_20051011.txt. This update addresses the issue by incorporating OpenSSL version 0.9.7i.

- **passwordserver**

  CVE-ID: CVE-2005-3701

  Available for: Mac OS X Server v10.3.9, Mac OS X Server v10.4.3

  Impact: Local users on Open Directory master servers may gain elevated privileges

  Description: When creating an Open Directory master server, credentials may be compromised. This could lead to unprivileged local users gaining elevated privileges on the server. This update addresses the issue by ensuring the credentials are protected.

- **Safari**

  CVE-ID: CVE-2005-2491

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.3, Mac OS X Server v10.4.3

  Impact: Processing a regular expressions may result in arbitrary code execution

  Description: The JavaScript engine in Safari uses a version of the PCRE library that is vulnerable to a potentially exploitable heap overflow. This may lead to the execution of arbitrary code. This update addresses the issue by providing a new version of the JavaScript engine that incorporates more robust input validation.

- **Safari**

  CVE-ID: CVE-2005-3702

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS Xv10.4.3, Mac OS X Server v10.4.3

  Impact: Safari may download files outside of the designated downloaddirectory

  Description: When files are downloaded in Safari they are normally placed in the location specified as the download directory. However, if a web site suggests an overlong filename for a download, it is possible for Safari to create this file in other locations. Although the filename and location of the downloaded file content cannot be directly specified by remote servers, this may still lead to downloading content into locations accessible to other users. This update addresses the issue by rejecting overlong filenames.

- **Safari**

  CVE-ID: CVE-2005-3703

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.3, Mac OS X Server v10.4.3

  Impact: JavaScript dialog boxes in Safari may be misleading

  Description: In Safari, JavaScript dialog boxes do not indicate the web site that created them. This could mislead users into unintentionally disclosing information to a web site. This update addresses the issue by displaying the originating site name in JavaScript dialog boxes. Credit to Jakob Balle of Secunia Research for reporting this issue.

- **Safari**

CVE-ID: CVE-2005-3705

Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS X v10.4.3, Mac OS X Server v10.4.3

Impact: Visiting malicious web sites with WebKit-based applications may lead to arbitrary code execution

Description: WebKit contains a heap overflow that may lead to the execution of arbitrary code. This may be triggered by content downloaded from malicious web sites in applications that use WebKit such as Safari. This update addresses the issue by removing the heap overflow from WebKit. Credit to Neil Archibald of Suresec LTD and Marco Mella for reporting this issue.

- **sudo**

  CVE-ID: CVE-2005-1993

  Available for: Mac OS X v10.3.9, Mac OS X Server v10.3.9, Mac OS Xv10.4.3, Mac OS X Server v10.4.3

  Impact: Local users may be able to gain elevated privileges in certain sudo configurations

  Description: Sudo allows system administrators to grant users the ability to run specific commands with elevated privileges. Although the default configuration is not vulnerable to this issue, custom sudo configurations may not properly restrict users. Further information on this issue is available at http://www.sudo.ws/sudo/alerts/path_race.html. This update addresses the issue by incorporating sudo version 1.6.8p9.

- **syslog**

  CVE-ID: CVE-2005-3704

  Available for: Mac OS X v10.4.3, Mac OS X Server v10.4.3

  Impact: System log entries may be forged

  Description: The system log server records syslog messages verbatim. By supplying control characters such as the newline character, a local attacker could forge entries with the intention to mislead the system administrator. This update addresses the issue by specially handling control characters and other non-printable characters. This issue does not affect systems prior to Mac OS X v10.4. Credit to HELIOS Software GmbH for reporting this issue.

- **Additional Information**

  Also included in this update are enhancements to Safari to improve handling of credit card security codes (Mac OS X v10.3.9 and Mac OS X v10.4.3), CoreTypes to improve handling of Terminal files (Mac OS X v10.4.3), QuickDraw Manager to improve rendering of PICT files (Mac OS X v10.3.9), documentation regarding OpenSSH and PAM (Mac OS X v10.4.3), and ServerMigration to remove unneeded privileges.

About the security content of iTunes 6 for Windows

This article has been archived and is no longer updated by Apple.

This document describes the security content of iTunes 6 for Windows, which can be downloaded and installed via Software Update preferences, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred and any necessary patches or releases are available. To learn more about Apple Product Security, see the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

iTunes 6 for Windows

- CVE-ID: CVE-2005-2938

  Available for: Microsoft Windows XP, Microsoft Windows 2000

  Impact: iTunes 5 for Windows may launch the wrong helper program

  Description: Due to the way iTunes 5 for Windows launches its helper application, multiple system paths are searched to determine which program to run. This may allow a malicious user on the local system to create an environment where an alternate program will be executed by iTunes. This has already been addressed in the iTunes 6 release for Windows (2005-10-12), available from: (http://www.apple.com/itunes/download/) .

This advisory is being released at this time (2005-11-15) to coordinate with other vendors whose products were also affected by the vulnerability in the helper application launch mechanism. Credit to iDEFENSE for reporting this issue to us.

Aperture: Can‘t restore from a vault due to disk errors

This article has been archived and is no longer updated by Apple.

If the volume that contains your vault needs to be repaired, your attempt to restore from the vault may end in a message similar to "restore library operation failed." To resolve the issue, try Disk Utility:

1. Quit Aperture.
2. Open Disk Utility, which is located in your Utilities folder (/Applications/Utilities).
3. Select the volume that contains the vault, and click Verify Disk.
4. If Disk Utility finds any errors, click Repair Disk.
5. Wait until Disk Utility is finished, then quit it.
6. Open Aperture and try to restore from the vault again.

Aperture can‘t import images from a folder whose name begins with a tilde (~)

This article has been archived and is no longer updated by Apple.

If you have a folder with a name that begins with a tilde character (~), and the folder contains valid images, Aperture will tell you that there are zero images to import. Drag and drop from this folder also won't work.

For technical reasons, Aperture does not support names starting with this character. You should rename the folder.

About BroadbandTuner

This article has been archived and is no longer updated by Apple.

BroadbandTuner is an installer package for use with Internet connections that have longer than normal network latency. Examples include some Verizon FiOS connections and satellite-based services such as EarthLink/DirecWay. The common characteristic is high speed broadband with high latency.

The BroadbandTuner modifies the default value of TCP buffer space, increasing it from 64KB to 350KB on the receiving side and from 64KB to 128KB on the sending side. This allows Mac OS X to achieve maximum throughput on affected connections.

To uninstall BroadbandTuner, simply run the BroadbandTuner installer again. When BroadbandTuner is present, this automatically causes the Uninstaller to run.

BroadbandTuner requires Mac OS X 10.4 or later.

Important: Information about products not manufactured by Apple is provided for information purposes only and does not constitute Apple's recommendation or endorsement. Please contact the vendor for additional information.

Aperture: How to make fine adjustments with sliders in the Adjustments Inspector

This article has been archived and is no longer updated by Apple.

When you're making adjustments, the sliders default to a certain minimum increment, such as 10 or 1, depending on the adjustment. Oftentimes you might want to make a finer adjustment without having to resort to keyboard entry. Finer adjustments might be useful for straightening or white balance, for example.

Aperture provides "infinite sliders" to allow exactly that. When you put your mouse pointer over the numerical value of your adjustment, to the right of the slider, the pointer will convert to an I-beam, which indicates the availability of the infinite slider. To use it, press and hold the mouse button when the I-beam is visible, then move the mouse left and right to adjust.

To change the rate of adjustment, use the Shift and Option keys. Shift will accelerate the rate of adjustment, while Option will decelerate the rate of adjustment to the finest available increment.

Tip: For certain adjustments, infinite sliders can reach extremes of the adjustment range which are not available to the regular sliders.

Published Date: Oct 10, 2016

Aperture: Can‘t update vault on a network volume

This article has been archived and is no longer updated by Apple.

Network volumes are not recommended or supported for Aperture. If you create a vault locally, move it to a network volume, and update the vault location in Aperture, then attempts to update the vault may fail.

Final Cut Pro 5 and iMac G5 (iSight): Video from built-in camera is seen in Edit to Tape window

This article has been archived and is no longer updated by Apple.

If you're working in Final Cut Pro 5 on an iMac G5 (iSight), it's possible for the Edit to Tape window to react to the iMac's built-in iSight camera, as though you had an extra DV camera or video recorder connected to a FireWire port. Situations may include:

- If you have a DV device powered on and connected to FireWire while the Edit to Tape window is open, and you turn that camera off, video from the iMac's built-in iSight camera may appear in the Edit to Tape window.
- If you switch to the Video tab from another tab in the Edit to Tape window, video from the iMac's built-in iSight camera may appear instead of color bars.
- If the DV device connected to FireWire is powered back on while the Edit to Tape window is open, you might see the "VTR OK" message as usual, but instead of color bars, you see the video from the iMac's built-in iSight camera.

If any of these occur, there's no need to worry — just follow these steps:

1. Close the Edit to Tape window.
2. Power off the DV camera or video recorder that's connected to FireWire.
3. Power the camera or video recorder back on.
4. Open the Edit to Tape window.

Video from the DV device should now be recognized normally. If it is not:

1. Save any open projects and close Final Cut Pro.
2. Use the Dock (or Command-Tab) to review programs that are running, and quit any that might be trying to use FireWire video input/output. This includes programs like iMovie, QuickTime Player (with QuickTime Pro), and Photo Booth.
3. Power on the DV device and verify that it is connected to your computer via FireWire.
4. Open Final Cut Pro, and leave the DV device powered on and connected while working.

Why can‘t I playback voice memos on my iPod?

This article has been archived and is no longer updated by Apple.

You may be unable to playback recorded voice memos after navigating to **Extras** > **Voice Memos** on your iPod. After selecting the desired voice memo and choosing play, the menu will revert to the Voice Memos selection screen. This can happen with:

- iPod with color display (iPod photo)
- iPod (Click Wheel)
- A third-party microphone or audio recorder.

To address this, update to the latest version of the iPod software. Use iPod (Click Wheel) Software 3.1.1 or later or iPod (color display) Software 1.2.1 or later. The iPod Updater 2006-01-10 includes these versions and can be downloaded here.

If you're not sure what iPod model you have, click here.

Aperture won‘t import images that lack a file extension

This article has been archived and is no longer updated by Apple.

Aperture won't import images from your iPhoto Library that have no filename extension (such as .tif or .jpg).

Files must have a recognized extension for Aperture to import them.

Published Date: Oct 10, 2016

Aperture Library can‘t be shared

This article has been archived and is no longer updated by Apple.

If two or more users simultaneously access the same Aperture Library, you will get an alert message on subsequent launch that says there was an error opening the Aperture Library.

This can happen if you place the Aperture Library on an Xsan volume or other network volume and multiple users access it.

The Aperture Library is not designed to be shared among users, so you should not do so.

Published Date: Oct 10, 2016

New iPhoto Film Roll Names Do Not Carry Over to Aperture

This article has been archived and is no longer updated by Apple.

If you rename a film roll in iPhoto and subsquently import that film roll from iPhoto to Aperture, the fill roll will come into Aperture under its original name, not the later name.

This happens due to the way iPhoto writes film roll name changes to XML. You're free to rename it again in Aperture.

This issue is resolved in Aperture 1.5.

Published Date: Oct 10, 2016

Mac OS X 10.4.3: Displayed contents of a remote AFP volume don‘t update automatically as in previous OS versions

This article has been archived and is no longer updated by Apple.

When you have the contents of a remote Apple Filing Protocol (AFP) volume visible in the Finder on a Mac OS X 10.4.3 or Server 10.4.3 computer, those contents will not be automatically updated when modified by another user.

Note: AFP is also known by service names such as Personal File Sharing, Apple File Service, and AppleShare.

If you select or try to open an item that is no longer present on the server, or which has been relocated, you'll encounter one or more of these symptoms:

- The associated application launches, and a message says "File 'The Filename' does not exist."
- The file disappears without a message.
- The associated application launches, but the file does not open; when you return to the Finder window the file is gone.
- The associated application launches, and a message says "No such file or directory."

The workaround for this issue is to close the Finder window and open a new one, which will force a refresh of the server contents.

This document will be updated as more information becomes available.

Aperture: Some images duplicated when importing from iPhoto

This article has been archived and is no longer updated by Apple.

Sometimes you get two copies of an image imported from iPhoto, and the pair is stacked. Though this might surprise you, the reason is very simple. Whenever you edit in iPhoto, it preserves the original and makes the changes to a copy. When you import to Aperture, you get both the original and the copy from iPhoto.

If you want the originals only, here's a quick way to remove the copies by using the "iPhoto-edited" keyword:

1. Click any image in the project to select it.
2. Choose **Edit > Select All**.
3. Choose **Stacks > Unstack**.
4. In the browser's search box (to the right of the magnifying glass), type: `iPhoto-edited`

This will cause only iPhoto-edited images to appear in the Browser. Now you can relocate or delete them as you please.

Note: If you have manually edited the contents of the iPhoto Library or have used any third-party software that sub-manages or attempts to minimize the size of the iPhoto Library (by deleting originals, for example) then you need to exercise caution. Rather than delete the files immediately, consider temporarily storing them in another project until you're sure you have everything you want to keep in the main project.

This issue is resolved in Aperture 1.5.

Mac OS X 10.4.2 or later: File doesn‘t import into Address Book

This article has been archived and is no longer updated by Apple.

In Mac OS X 10.4.2 or later, Address Book might fail to import information from a .txt or .cvs file if the file contains a line break. No alert message appears when this happens, but the data from the file will not appear in Address Book.

Where do line breaks come from? Here's example: In Microsoft Excel, you can insert a line break by pressing Control-Option-Return.

To resolve the issue, open the file in a text editing application or the application that created the file, find and remove any line breaks, save the file, and then import it again into Address Book

This document will be updated as more information becomes available.

Mac OS X 10.4: Error -8058, unable to eject when trying to copy a disc in Finder

This article has been archived and is no longer updated by Apple.

If you insert a disc (CD or DVD) in Mac OS X 10.4, then try to make a copy of it using the Finder **File** menu's **Duplicate** command, an "error -8058" alert may appear, and the disc might not eject.

Solution

Try the Eject key to eject the disc. If that doesn't work, restart the computer, then hold down the mouse button until the disc ejects.

Use Disk Utility to duplicate a disc, instead of the Finder.

This document will be updated as more information becomes available.

Safari, Mac OS X 10.2: Yahoo webmail does not work as expected

This article has been archived and is no longer updated by Apple.

Websites and standards evolve over time. As such, Yahoo webmail no longer works properly in the latest version of Safari that is available for Mac OS X 10.2.8.

Apple no longer offers Safari updates for Mac OS X 10.2. As a workaround, try using a different browser.

Important: Mention of third-party websites and products is for informational purposes only and constitutes neither an endorsement nor a recommendation. Apple assumes no responsibility with regard to the selection, performance or use of information or products found at third-party websites. Apple provides this only as a convenience to our users. Apple has not tested the information found on these sites and makes no representations regarding its accuracy or reliability. Mac OS X 10.4.3: "Error Reading Package" alert when installing software from earlier DVDs

This article has been archived and is no longer updated by Apple.

With Mac OS X 10.4.3 installed, if you use a Mac OS X 10.3.4 or later Install DVD to try to reinstall a bundled application, this alert appears:

> "Error Reading Package - The package is damaged and cannot be read."

This can happen on computers that shipped with two Mac OS X 10.3.4 or later installation DVDs.

Solution

Download and install the Mac OS X 10.4.4 Update, or later, then use your Mac OS X 10.3.4 or later Install DVD to reinstall a bundled application.

Published Date: Oct 10, 2016

iDVD and iMovie: Image orientation changes when a RAW image is imported from the Finder

This article has been archived and is no longer updated by Apple.

In Mac OS X 10.4.3 it is now possible to use RAW images in iDVD and iMovie projects. RAW images with a vertical (portrait) orientation may change orientation if you drag them directly into iDVD or iMovie.

In iDVD, this can occur when you add an image to the background of a menu or to a slideshow. In iMovie this can occur if you drag a RAW image file to the Clips Pane or to the Movie Timeline.

To maintain the correct image orientation, import the RAW image into iPhoto before you import it into your iMovie or iDVD project. Then, in iMovie and iDVD, access the image from their Media Browsers (in iMovie from the Photos pane, in iDVD from the Customize Panel's Media pane).

For more information on RAW images, see this document.

This document will be updated as more information becomes available.

About the security content of J2SE 5.0 Release 3

This article has been archived and is no longer updated by Apple.

This document describes the security content of J2SE 5.0 Release 3, which can be downloaded and installed using Software Update, or from Apple Downloads.

For the protection of our customers, Apple does not disclose, discuss, or confirm security issues until a full investigation has occurred, and any necessary patches or releases are available. To learn more about Apple Product Security, visit the Apple Product Security website.

For information about the Apple Product Security PGP Key, see "How to Use the Apple Product Security PGP Key."

Where possible, CVE IDs are used to reference the vulnerabilities for further information.

To learn about other Security Updates, see "Apple Security Updates."

J2SE 5.0 Release 3

Available for: Mac OS X v10.4.2 or later with Java 1.3.1 and 1.4.2Release 2

On November 28, 2005 (2005-11-28), Sun released Security Alerts #102003, #102050 and #102017. These alerts describe vulnerabilities that are already fixed in Mac OS X v10.4 with Java 1.3.1 & 1.4.2 Release 2 and J2SE 5.0 Release 3.

Java 1.3.1 and 1.4.2 Release 2 have been available since September 13, 2005 (2005-09-13).

J2SE 5.0 Release 3 has been available since November 15, 2005 (2005-11-15).

These may be obtained using Software Update preferences, or Apple's Software Downloads website:
http://www.apple.com/support/downloads/java2se50release3.html
http://www.apple.com/support/downloads/java131and142release2.html

For Java 1.3.1 & Java 1.4.2:
The download file is named: "Java131and142Release2.dmg"
Its SHA-1 digest is: 9e9f752ff56da7ab13f3b11f40b528c901145019

For J2SE 5.0 Release 3:
The download file is named: "J2SE50Release3.dmg"
Its SHA-1 digest is: c5fe977bd9a2d145e9d122ed80768488c89dcc98

For systems running Mac OS X v10.3.9, the Sun alerts are fixed with Java Security Update, which was released on September 13, 2005. It is available either from the Software Update pane in SystemPreferences, or Apple's Software Downloads web site:
http://www.apple.com/support/downloads/javasecurityupdate.html

The download file is named: "JavaSecurityUpdate4.dmg"
Its SHA-1 digest is: b6babb98a98c20bdc7d2ca9b14c56b93ff3813a7

If you want to determine that your system has the latest Java versions installed, open Terminal (from Applications/Utilities) and type one of these commands:

For Mac OS X v10.4.2 or later, type the following on one line, then press Return:

```
/System/Library/Frameworks/JavaVM.framework/Versions/1.5.0/Commands/java -version
```
You should see: java version "1.5.0_05"

For Mac OS X v10.3.9 or later, type the following on one line, then press Return:

```
/System/Library/Frameworks/JavaVM.framework/Versions/1.3.1/Commands/java -version
```
You should see: java version "1.3.1_16"

```
/System/Library/Frameworks/JavaVM.framework/Versions/1.4.2/Commands/java -version
```
You should see: java version "1.4.2_09"

Logic Pro/Express 7: Undo command unavailable after using Quantize Engine

This article has been archived and is no longer updated by Apple.

After you quantize audio in the Sample Edit window by selecting **Factory > Quantize Engine**, Undo becomes unavailable in the Edit menu.

For technical reasons, Undo is not possible for audio quantize. Before using the Quantize Engine, create a backup of the audio file by choosing **Audio File > Create Backup**. If you change your mind after quantizing, choose **Audio File > Revert to Backup**.

Final Cut Pro 5: Subclips may result from batch capture of 720p, 60 fps media

This article has been archived and is no longer updated by Apple.

If you're capturing 720p HD media at 60 frames per second (fps) using serial device control, there's a situation in which logged clips appear as unlinked subclips in the Browser after they are captured.

The issue can occur when using serial device control to batch capture 720p media at 60 fps because Final Cut Pro treats some details of the capture scenario as if the media were running at 30 fps instead of 60. The result is that your media is captured to disk normally, but Final Cut Pro presents each clip as if it is part of something that is larger than the clip's media. This is similar to what a subclip is.

What you see is that the captured clips appear as subclips in the Browser, but they behave as if they are offline. In fact, the clips were captured correctly, but Final Cut Pro does treat see them as usable.

This issue is addressed in Final Cut Pro 5.0.4.

Update to Final Cut Pro 5.0.4 via **Software Update** (Select **Apple > System Preferences**), or download the update here.

Without the Final Cut Pro 5.0.4 update, you can apply one of the workarounds listed below. The best one to suit you may depend on equipment you have available, your workflow and/or your current production phase.

- **Use FireWire**
  Your HD video recorder may include support for FireWire, and Final Cut Pro is able to correctly capture 720p 60 fps media over FireWire while using the same connection for device control.
- **Use Capture Now**
  If you are capturing media for the first time in a project (not recapturing), using Capture Now can be a good solution. Because of a difference in the way Final Cut Pro interprets incoming data during the Capture Now process, 720p media you acquire using Capture Now will not appear as subclips when using serial device control.
- **Import from Finder (before editing)**
  If you have already logged clips that need to be captured, and haven't yet started editing, the following steps might be best suited for this stage in your workflow.
  1. Batch capture your logged clips as you normally would. When the capture process is finished, the clips will appear as unlinked subclips in the Browser.
  2. Choose **File** > **New** > **Bin** to create a new bin in the Browser. Name this new bin "Temp" (or something similar — you won't be using it for long).
  3. Select all of the subclips and drag them into the "Temp" bin.
  4. In Finder, go to the Capture Scratch folder for this project, select the newly captured clips, and drag them right into Final Cut Pro's Browser.
     (**Finder Tip**: If you view the Capture Scratch window in List view and sort the columns by Date Modified, recently captured items will appear at the top of the list.)
  5. After doing this "Finder import", your clips should appear as they were logged, and not look like subclips with long durations.
  6. After verifying that you have your clips, it's okay to delete the "Temp" bin. (Creating the "Temp" bin is not even really necessary; it is suggested here to keep things distinct, and for safety, i.e., in case you make a mistake in the Finder.)
- **Remove Subclip Limits (if you have already begun editing)**
  The following workaround steps are best suited if you will be recapturing any clips affected by this issue, and you're already at a point in your workflow where you have done either of the following:
  - Added affected clips to the Timeline
  - Modified affected items in the Browser

  Take these steps to work around details of recapturing with this issue:
  1. Choose **File** > **New** > **Bin** to create a new bin in the Browser and call it something like "Batch Items."
  2. Locate all the clips in the Browser that you will be recapturing and place them into the "Batch Items" bin. (If you need or want to create sub-bins within this bin for organizational purposes, that's fine.)
  3. Select all the items within the "Batch Items" bin and choose **File** > **Batch Capture** to begin recapturing the selected items.

     When finished, the captured clips will appear as subclips and instances of those items in the Timeline will appear to be online, but may contain no media on playback.
  4. Select all the captured items in the "Batch Items" bin and choose **Modify** > **Remove Subclip Limits**.

  Now the items in the Timeline will be online and play normally, and the Browser instances will be online and will have the appropriate icon.

  Notes
  1. One side effect of the "Remove Subclip Limits" workaround is that all clips updated by the **Remove Subclip Limits** operation in this case will erroneously display double the correct value for their Duration property in Browser columns and in Item Properties. If

played in the Viewer, the second half of the clip will display as black. The edit points in the Timeline and disk storage requirements are not affected. The Browser clips can be used for normal editing by simply trimming off the segment of the media that displays as black.

2. If you use the "Remove Subclip Limits" workaround, and then for whatever reason need to recapture those same clips yet again, a small number of clips within the Timeline could have their out points trimmed by a single frame. Cut-only edits should be rechecked for accuracy and adjusted if necessary.

iPod: Alarm going off at wrong time

This article has been archived and is no longer updated by Apple.

If your alarm is going off at the wrong time on your iPod nano or Fifth Generation iPod, make sure you are setting the alarm on the correct clock.

iPod nano and Fifth Generation iPod support multiple clocks. If you configure an alarm on your San Francisco clock for 10:00 AM, the alarm will go off at 10:00 AM Pacific Standard Time, even if you are in Austin (Central Standard Time). Make sure you set your alarms on the correct clock. To set an alarm:

1. Select **Extras** > **Clock** on the iPod.
2. Select the correct clock and press the Center button.
3. Select Alarm Clock and press the Center button.
4. Configure the alarm as you want it.

Aperture 1.0: Checking RGB color values

This article has been archived and is no longer updated by Apple.

Aperture 1.1 or later includes a built-in color meter that can display RGB, CMYK, and lab values.

Aperture 1.0 does not include a pixel color meter, or "dropper," so you can use this workaround: Look in your Utilities folder (located inside the Applications folder) for DigitalColor Meter, which will provide the desired function. Be sure to familiarize yourself with the Preferences in DigitalColor meter. The option to "Float window above other apps" may be particularly convenient while color balancing in Aperture.

Published Date: Oct 10, 2016

Aperture: White Balance adjustment produces inaccurate result

This article has been archived and is no longer updated by Apple.

In some situations, the White Balance adjustment in Aperture may not produce an accurate result. When using a pixel meter, such as DigitalColor Meter, you may find unexpected gaps between RGB channel values of the sampled area after balancing.

To resolve the issue, update to Aperture 1.0.1 or later.

About Server Admin Tools 10.4.7

This article has been archived and is no longer updated by Apple.

This article provides information about the Mac OS X Server administration software applications. You can install them on a computer other than your server for remote administration.

This update provides Universal applications for administering Mac OS X Server 10.4 from both Intel- and PowerPC-based Macintosh computers. It also includes an updated System Image Utility application for creating NetBoot and NetInstall images of Intel-based Macs. Here's the complete list of installed applications:

- Server Admin
- Workgroup Manager
- QuickTime Broadcaster
- QTSS Publisher
- Server Assistant
- Server Monitor
- Xgrid Admin
- System Image Utility
- Gateway Setup Assistant

For a brief description of each application, please see this web page.

How to install

For Mac OS X Server 10.4 and later

Update to Mac OS X Server 10.4.7 (either manually or via Software Update), which includes Server Admin Tools 10.4.7.

Mac OS X (client) 10.4 or later

1. If you are using any version from 10.4 to 10.4.6, you should first update to Mac OS X 10.4.7 or later.
2. If you have already installed Server Admin Tools 10.4 or 10.4.4, use Software Update to get Server Admin Tools 10.4.7.
3. If you have not installed a previous version of the admin tools, you can download the full installer here.

Important: If you have moved any of the Server Admin Tools out of their original locations in the (/Applications/Server/) folder, the update may not appear in Software Update at all. Return the Server Admin Tools to their original locations before using Software Update.

Notes

1. Only Mac OS X Server 10.4.4 or later supports Intel NetBoot images. You can't host Intel-based images on Mac OS X Server 10.4.3 or earlier.
2. To administer Mac OS X Server 10.4 from an Intel-based Mac you need to use the Universal Server Admin Tools 10.4.4 or later. Apple does not support or recommend using older Server Admin tools with Rosetta.

iDVD: Which themes are included

This article has been archived and is no longer updated by Apple.

Here is a list of the themes included with the various versions of iDVD.

Note that themes from older versions of iDVD may still be installed if you update to a newer version. See the following articles for more information:

- iDVD 4/5: Where are the older themes?
- iDVD 5: Previous themes are missing
- iDVD 6: Themes pane is blank after upgrading

iDVD 6*

- Travel
- Pass Through
- Road Trip
- Reflection White
- Reflection Black
- Mirror
- Full Frame
- Shelves
- Watercolor
- Brushstroke

*These themes are available in Widescreen (16:9) aspect ratio.

iDVD 5

- Travel Cards
- Memories
- Sliding Panes
- Full Frame 1
- Full Frame 2
- Anime Pop
- Wedding White
- Baby Mobile
- Travel 1
- Travel 2
- Techno B&W
- Techno Color
- Lines
- Portfolio
- Scrapbook

iDVD 4

- Wedding Bronze One
- Wedding Bronze Two
- Wedding Silver One
- Wedding Silver Two
- Drive In One
- Drive In Two
- Montage
- Kids Theater One
- Kids Theater Two
- Road Trip One
- Road Trip Two
- Pop Art
- Reveal
- Fish One
- Fish Two
- Blocks
- Marquee

- Transparent Blue
- Transparent Green
- Transparent Black

iDVD 3

- Theater
- Book
- Projector
- Gen Y
- Picture In Picture
- Brush Strokes
- Western
- Sport
- Passport
- Postcard
- Fun
- Confetti
- Rose Heart
- Blue
- Pink
- Orange
- Portfolio B&W
- Portfolio Color
- Moving Bars
- Brushed Metal One
- Brushed Metal Two
- Green Linen One
- Green Linen Two
- Lightbox

Microsoft Office 2004 Test Drive expired alert

This article has been archived and is no longer updated by Apple.

If you try to open Microsoft Office 2004 Test Drive, you may see a message that the "demo has expired." This can happen with any version of Mac OS X.

If you are opening it for the first time and this occurs, download and install the Microsoft Office 2004 for Mac Test Drive 11.0.2 Update. Only use this update if you encounter this issue the very first time you open Office 2004 Test Drive.

If you have used Microsoft Office 2004 Test Drive for less than 30 days (and are not opening it for the first time), download and install Office 2004 for Mac Test Drive from Microsoft. It is one of the links in the Office 2004 section, then follow these steps:

1. Locate the folder named "Office 2004 for Mac Test Drive" in the Applications folder.
2. Back up any documents that you may have saved in that folder.
3. Delete the "Office 2004 for Mac Test Drive" folder from the Applications folder.
4. Download and install Microsoft Office 2004 Test Drive from Microsoft's website.

Backup 3: Unable to complete Backup to Windows 2003 Server

This article has been archived and is no longer updated by Apple.

If you try to back your data up to a destination volume running Windows 2003 Server using Backup 3.0.x, the backup may fail to complete. The backup may appear to have completed successfully, but the backup file's extension will be named incorrectly:

```
Home Folder - 2005.09.01-18.26.11.495.backXX
```

instead of using the proper file extension:

```
Home Folder - 2005.09.01-18.26.11.495.IncrementalBackup
```

This issue can occur if Norton Anti-Virus' Auto-Protect feature is enabled and if the destination volume is running Windows 2003 Server with Active Directory enabled.

To resolve this issue, disable Norton Anti-Virus' Auto-Protect feature before you start the backup. For assistance with disabling Auto-Protect, please consult the documentation included with Norton Anti-Virus or contact Symantec.

Backup 3 may unexpectedly quit if essential applications are missing

This article has been archived and is no longer updated by Apple.

Backup 3.0.x may unexpectedly quit if certain essential system applications are missing or have been renamed.

This issue may occur if any of the following system utilities are missing from their standard location:

```
du
hdiutil
gzip
```

These files are normally invisible. If Backup is unexpectedly quitting when you try to use it, look for the files and make sure they're there:

1. From the **Go** menu, select **Go to Folder**.
2. In the window that appears, type the following exactly as it appears below:
   ```
   /usr/bin/
   ```
3. Click on Go.

The folder should appear in a new window, displaying its contents. If any of the above files are missing, reinstall Mac OS X.

Published Date: Feb 19, 2012

Aperture 1.x does not recognize some DNG files

This article has been archived and is no longer updated by Apple.

Aperture 1.x only supports DNG files originated from cameras for which Aperture 1.x also supports the RAW format. If you import other DNG files, you may see the "Unrecognized File Format" message.

For the list of RAW-supported cameras, see this page.

Aperture 2 offers baseline support for most DNG images, regardless of whether the camera's RAW format is natively supported. For more details, click here.

Mac OS X Server 10.4.3: MySQL Network Connection disabled by default

This article has been archived and is no longer updated by Apple.

The "Allow network connections" option is disabled by default in MySQL starting with Mac OS X Server 10.4.3.

Symptom

WebObjects application instances are unable to connect to MySQL. The JDBC connection will fail.

Solution

For Mac OS X Server with Server Tools installed:

1. Go to /Applications/Server.
2. Launch the MySQL Manager application, and stop the MySQL service if it is running.
3. Enable "Allow network connections" by selecting the checkbox
4. Restart the MySQL service.

Note: You need to have administrator privileges to modify the “Allow network connections﷒? settings.

For Mac OS X Server without Server Tools (headless installation):

1. Edit the file /etc/mysqlManager.plist so that it has "yes" instead of "no" for the key "allowNetwork":

```
<key>allowNetwork</key>
<string>yes</string>
```

2. Stop and start the MySQL Service:
   a. Execute this command: `sudo SystemStarter stop MySQL`
   b. Wait a few seconds and confirm that the service has shut down.
   c. Execute: `sudo SystemStarter start MySQL`

Aperture: Can‘t remove images from an album

This article has been archived and is no longer updated by Apple.

When you've made a certain type of selection, you won't be able to remove images from an album. the **Remove from Album** command in the Images menu will be dimmed, and the Delete key will have no effect (other than triggering an alert sound).

This happens when you've selected an image or images from an open stack, but not the entire stack. Aperture indicates selection of an entire stack by a thin white line around its edges.

The best way to resolve the issue is to close the stack before deleting.

Mac OS X 10.4 (Japanese): Can‘t type in Copies field in Print window

This article has been archived and is no longer updated by Apple.

You may not be able to enter text in a Print window's Copies field when using some Carbon applications (applications that work natively with both Mac OS X and Mac OS 9) such as AppleWorks 6.2.9.

The first time you type in the Copies field using the Kotoeri Romaji input method, it works as expected. But on a subsequent attempt (second, third, or later) in the same application, the input fails.

Workarounds

Use any of these workarounds:

- Drag the Print window to a different position, then type in the Copies field.
- After the Print window appears, click the desktop once or go to a different application, then go back to the original application and print.
- Quit and reopen the application before printing.

This document will be updated as more information becomes available.

Motion unexpectedly quits ("crash") With Decklink HD Card

This article has been archived and is no longer updated by Apple.

Motion may unexpectedly quit when the Blackmagic Decklink "Video Desktop" is enabled. Specifically, it occurs when adding filters to a layer or object in your project.

To resolve the issue, update to Mac OS X 10.4.4 or later.

Mac OS X Server: Authentication issues with DIGEST-MD5, "SASL error -13"

This article has been archived and is no longer updated by Apple.

Sometimes the SASLRealm will be set to different values on an Open Directory master and its replicas. This can happen when a master doesn't have the correct hostname; it's not an issue in the absence of replicas. The symptoms you see are:

- A user can't log in to some systems
- The `/Library/Logs/PasswordService/ApplePasswordServer.Server.log` on the relevant password server contains this message:

```
Dec 5 2005 14:28:26 AUTH2: {0x4322345c67952fc40000016800000685, user1} DIGEST-MD5 authentication failed,
SASL error -13 (password incorrect).
```

When you create or set users passwords, the SASLRealm for that password server is used to create the DIGEST-MD5 hashes. This password will work on all password servers that also have the same SASLRealm setting. They will not work on password servers with a different SASLRealm setting. **Note:** other authentication methods will work.

Applications that use DIGEST-MD5 are LoginWindow, and SSH when Kerberos is not used.

To resolve the issue:

1. Using your text editor of choice, set the SASLRealm in the file `/Library/Preferences/com.apple.passwordserver.plist` to be the same on each of the master and replicas. Normally you should use the fully qualified domain name (FQDN) of the master in place of "example.apple.com":

   ```
   <key>SASLRealm</key>    <string>example.apple.com</string>
   ```

   If the file does not have an SASLRealm entry add one before the </dict>.

2. Restart the PasswordService using this command:

   ```
   killall PasswordService
   ```

3. Reset the all the passwords that don't work.

Methods for testing passwords

You should test an affected user account with both of these commands. Run them on the master and the replicas.

To test for DIGEST-MD5 authentication:

```
dirt -u <username> -p <password>
```

If this works, the last line will be "Success". To test another method, SMB-NT:

```
dirt -a nt --u <username> -p <password>
```

If this works, the last line will be "Good".

If the first test says the password is incorrect and the second one works, then the user needs a password reset.

Setting passwords

You can use Workgroup Manager or this command to set the passwords. This command will work even if the domain admin is having issues and Workgroup Manager can't:

```
pwpolicy -a diradmin -p <diradmin's password> -u  <user account> -setpassword <password>
```

Aperture: Metadata import/export issues (IPTC, keywords, EXIF)

This article has been archived and is no longer updated by Apple.

Aperture currently has several issues related to metadata import/export under investigation. This article describes the issues and distinguishes them from one intentional aspect of metadata export which may be perceived as an issue.

Issue: EXIF missing when exporting versions as TIFF, PNG

Note: Aperture 1.1 with Mac OS X 10.4.6 or later resolves this issue (about updating).

If you export a version as TIFF or PNG, you may see that most of the EXIF data is missing. However, it's present when exporting to JPEG or PSD (assuming that you have updated to Aperture 1.0.1 and Mac OS X 10.4.4, or later). Keywords and IPTC data should export as expected. Note that PNG simply does not support EXIF.

Issue: EXIF missing after Open With External Editor Command

Note: Aperture 1.1 with Mac OS X 10.4.6 or later resolves this issue (about updating).

Since the Open With External Editor command is creating a PSD or TIFF version, it behaves as described above. This means that if you have updated to Aperture 1.0.1 and Mac OS X 10.4.4, or later, that you would have metadata for a PSD but not a TIFF.

Issue: Metadata added prior to Aperture import is missing

If you use a third-party application such as Photo Mechanic to apply metadata to RAW images prior to Aperture import, the metadata is not currently recognized in the Aperture metadata inspector. However, it remains part of the file and is present if you export the master.

Additionally, if you add metadata using Aperture, export the images, and then reimport them, the Import window won't show what you added in the fields following **Add Metadata From**. These fields are designed for adding new metadata at time of import, not for displaying old metadata.

Issue: Aperture won't import certain files with added metadata

Under certain circumstances with certain cameras, Aperture may not be able to import files which have had metadata added by Photo Mechanic or similar applications. Sometimes the file may import but then result in an "unsupported format" message.

By Design: Aperture won't export metadata with RAW masters

Unlike applications such as Photo Mechanic, Aperture does not write IPTC and keywords to the original RAW file. Instead, Aperture stores this information in its library and attaches it when exporting versions in JPEG, TIFF, PSD, or PNG format. If you export the RAW masters, none of your metadata changes will come along with them. Unlike the issues listed above, this feature is by design.

If your goal is to archive RAW files outside of Aperture with metadata attached, you'll need a workaround to this aspect of Aperture's metadata handling. Because Aperture is designed to read added metadata at time of import (despite the current issue described above), the best long term solution (after issues are resolved) will be to add your metadata in Photo Mechanic (or similar) prior to importing them to Aperture and then refrain for the most part from using Aperture's metadata tools. If you don't like that workaround, a secondary workaround is to export JPEG versions to be kept alongside the RAW masters. To save disk space, the JPEG copies could be a minimal size.

Safari: POSIX error when attempting to upload

This article has been archived and is no longer updated by Apple.

If you're using a website with a form that allows you to upload files directly from Safari, you might occasionally encounter this message:

> POSIX error: Is a directory (NSPOSIXErrorDomain:21)

A "directory" is another term for a folder, and you can't upload folders in this scenario without first converting the folder to a single file (more on that in a second). Some files that don't *look* like folders in the Finder *really are* folders which are not used as such by you, so the Finder hides their folder status by default to make your life easier. Examples of this include application packages, Pages documents, RTFD documents, and Keynote presentations.

When you see the message above, the first thing you should do is double check that you selected the correct item. After that, you need to convert it to an "archive," which is a compressed version of the file or folder which will behave as a single file.

In the Finder, select the document or application that you want to compress. From the **File** menu, choose **Create Archive**. A compressed archive of the selected item will appear in the same folder as the original. It will have the same name as the original, but with ".zip" added to the end.

Tip: If you archive multiple items at once, the archived file is named "Archive.zip". To un-archive a zipped file, just double-click on it in the Finder.

Aperture: Image is garbled after using external editor

This article has been archived and is no longer updated by Apple.

If you use the Open With External Editor command, and have your preferences set to use PSD format for doing so, and then convert the image to CMYK in Photoshop, it will appear as a section of misaligned separation layers when it returns to Aperture. You will not get an "unsupported format" message as may occur in some other situations. For a longer answer, see Question 5 of Aperture: Avoiding issues with your External Editor (FAQ).

This document will be updated as more information becomes available.

Soundtrack Pro: Audio clip from a movie contains noise after being converted to looping

This article has been archived and is no longer updated by Apple.

If you convert an uncompressed audio clip from a movie to a looping clip in Soundtrack Pro 1.0.2, you may notice that the clip contains noise.

The solution is to save the audio clip as a looping file and then use the new clip.

1. Control-click the clip in the Multitrack Editor and choose **Save Clip As** from the shortcut menu.
2. In the resulting dialog box, be sure to select the "Looping" radio button before saving the file.
3. Replace the original audio clip with the new one.

This document will be updated as more information becomes available.

iMovie chapter markers won‘t be updated in iDVD project

This article has been archived and is no longer updated by Apple.

When you export an iMovie to iDVD you can add chapter markers to your movie so that viewers can review different sections of the movie on DVD.

After you create and save your iDVD project, you can return to the iMovie project and make changes. These changes will be applied to the iMovie in your iDVD project.

When changes have been made to the iMovie project, you will see a Modified Asset Warning dialog when you open your iDVD project again.

If you select Update, the changes you made in iMovie are reflected in the iDVD project, but your chapter markers may not function as expected in iDVD or on your DVD.

If you make changes to an iMovie project with chapter markers, you should send the iMovie to iDVD by selecting the Create iDVD Project button in the iDVD pane instead of just updating the project via the Modified Asset Warning dialog.

QuickTime Pro: DV format movies may require adjustment for iPod

This article has been archived and is no longer updated by Apple.

If you have QuickTime Pro 7.1.3 or later, just choose **File > Export** and then choose **Movie to iPod** from the **Export** pop-up menu to convert movies for use on a video-capable iPod.

If you have QuickTime Pro 7.0.3 to 7.1.2, it's still easy to convert movies to a format that will play on video-capable iPod, but it involves a few more steps. Before you convert a DV format movie using QuickTime's **Movie to iPod** exporter, it's a good idea to check the movie's display dimensions. DV format movies often need to be adjusted to a 4:3 aspect ratio (as described in the steps below). Doing this will ensure that the video of the resulting iPod-ready movie conforms to the proportions of the iPod's display.

This illustration shows what a DV NTSC video looks like on the iPod without adjustment on the left, and then on the right, with the adjustment described below.

Note: The following steps should be used with DV format movies. Most other formats do not require adjustment for use with QuickTime's Movie to iPod exporter.

1. Open the your movie in QuickTime Player.
2. From the **Window** menu, choose **Show Movie Properties**.
3. In the Properties window, select the Video track.
4. Select the Visual Settings button. (If you do not see the Visual Settings button, try selecting the Audio track, then reselect the Video track to refresh the button display.)
5. Deselect the Preserve Aspect Ratio checkbox.
6. Set the Scaled Size settings to 640 x 480 pixels.

   If your movie was not already at 640 x 480, you should see it change its shape slightly after entering the dimensions "640" and "480" in the Scaled Size fields. If your movie doesn't take the adjustment:
   - Press the Tab key on your keyboard to make sure that the numbers are registered after you typed them.
   - If your movie has tracks other than Audio and Video listed in the upper portion of the Properties Window (such as timecode tracks or hint tracks), disable them by unchecking the corresponding boxes for any tracks other than Audio, Video and Quartz Composer tracks.

7. Close the Properties window.
8. From the **File** menu, choose **Export**.
9. From the **Export** pop-up menu, choose **Movie to iPod (320x240)**.
10. Click Save to save your movie.

Additional Info

The DV format uses non-square pixels. When displayed on a television using DV equipment, the video automatically appears at a 4:3 ratio. But because your computer display has square pixels, the DV video is displayed with its geometric proportions slightly stretched when showing all pixels without interpolation.

Some software, like iMovie, makes a display adjustment automatically. But by default, QuickTime Player displays all pixels of DV format movies without interpolation, allowing for precise verification of DV video in professional workflows. This is by design, but it calls for compensation in cases such as the Movie to iPod exporter, which uses the movie's current aspect ratio for its input.
